"You leave it to lie on the roadside
(First trampling it down on the dust),
And fancy that such is your right here,
To break and to outrage our trust.

"You think us so weak till we sting you,
And give you at last your deserts;
And then you turn round in your anger
And vow that all women are flirts.

"Believe me, that if you would let us
Be honest and true, as we are
(Not striving to conquer us always).
The world would be better by far."

Temple Bar.

HUSBANDS AND WIVES.

MRS. CHARLOTTE E. FISHER.

I DO not say the husband is always to blame. The wife often makes home unhappy; too often both are in fault. Yet I think the husband is more apt to become careless and neglectful of little attentions soon after marriage than the wife is. A trusting, loving girl gives up her freedom forever and goes out from under the sheltering roof of the old home, to bless and brighten the new. Goes to be his own in sickness or health, for "better or worse," until one of the twain shall rest from all earthly labors.

Before marriage he was all attention as to his personal appearance; eager to gratify her every wish. He admired the rosebud she selected to wear on her bosom, but thought his own chosen rose-bud much lovelier. He admired the dress she wore, the ribbon in her hair, truly she could do nothing to please him that failed of its object. And he told all his love and admiration in actions, and what was still pleasanter, in words.

Now they are wedded, both sure of the other's love. The days are full of light and joy, she knows a shadow can never darken their home for is she not his darling; his own happy little wife and does he not tell her so every day? She does not believe any change comes after marriage unless it is greater and more perfect love and trust. Years pass. Have they carried the bloom of life with them? He has business to look after, but he loves his wife just the same, she will not believe otherwise. Yet, sometimes when he goes to his work, with only a hasty kiss and never once noticing the lily buds in her hair, or that she has on his favorite jewels, sometimes, I say, a feeling of disappointment clouds the joy in her heart. The full glory is dimmed. He continues to grow more neglectful. She wears the colors that used to please him; she strives to beautify his home in every possible manner, but he speaks no word of praise. He even finds fault with her once in a while; but what pains her most is his constant indifference, and he has too, a habit of putting her second instead of first in nearly everything. Occasionally, when he does happen to notice her he wonders at the worn face and quiet manner; and, doubtless thereby, she has become very careless of home enjoyments and love. Does he never remember the many times a gentle woman has stood beside him, lifting the hair from his brow or parting it with soft fingers, or caressingly laying a white hand on his hand. He used to kiss that same hand; holding it in both his own, and say many kindly things. Now she lingers near him, but he never lifts his eyes from his book to the face beside him, or finds one little word of endearment for his wife.

Oh, if the walls of her room could speak, would they not echo the words that had so often been spoken to them. "Oh! God, what have I done? What have I failed to do, that life is not as it once was? Oh! how have I frighted away all the tender words; all the caresses that once were mine? Oh why did I not die when every word and action were full of love? Better—far better, to have gone away from earth ere the bridal roses faded; than to have lived until my heart calls out vainly, day and night for the glory of departed days!"

THE NEGROES OF THE SOUTH.

E. F. M.

THE African race remains unchanged in many of its ideas and superstitions, living in many respects the old primitive life in the very midst of the discoveries and inventions of the new age. The contrivances of a negro who farms his little piece of land, his rude wagon, out-of-doors kitchen, etc., are as simple and rough as those of centuries ago; and like most ignorant people, every common action is fettered by numberless superstitions, signs, and traditional observances.

It is ill luck to use the wood of a tree that is blasted by lightning; ill luck to burn anything belonging to the dead—it must always be buried also. It is daring unknown misfortunes to carry fire from one place to another without spitting in the ashes first; ill luck for a girl, who is only a child to stir soap while it is being made; ill luck for a cat to be moved, or a dog to howl, or a Whip-poor-will to perch near the house, and certain death to begin a piece of work on Friday or Saturday which cannot be finished the same day. As for planting, sowing seed, killing hogs, all these processes are entirely under the sway of the moon, and should be done at certain favorable times.

Their religion is characterized by the same spirit as their everyday labor, and is won by visions and watching. They have their yearly meetings, where their preachers deliver impassioned and fervid discourses, and those who are "*seeking*" (as they call the desire of being converted,) are assisted by the prayers and exhortations of the members of the church. Those who are "*seeking*" often sit up night after night—not allowing themselves to sleep—for this would indicate culpable lukewarmness—and sometimes wandering alone in solitary and dark places in the woods. He is not considered to have *found* religion, until from over excitement and strained nerves, he has had a vision of hell and its horrors; the loveliness of heaven, and the Lord Himself who appears and declares that his sins are forgiven. After this, there succeeds a state of ecstasy, during which those who are "happy" dance together, spring into the air, shout aloud and clap their hands, and often fall to the ground at last in a swoon of sheer exhaustion. Their hymns are strongly characteristic and emotional in their wild, irregular rythms, their wistful cadences, their jubilant choruses, they breathe the very spirit of longing and desire.

It is said that the music of every exiled race tells the story of their exile, and certainly it is true that through the gayest negro tune, such as "Dixie," "Camptown Races," runs a minor tone of sorrow under its wild merriment. Some of their religious recitations and hymns are strangely picturesque, possessing a wild vividness which throws the scene into bold relief before you; as for instance the one on MOSES leading the people of Israel forth to freedom, while the dark waves rolled over PHARAOH'S army, and the many hymns which describe the appearance of GABRIEL,

"When louder yet, and yet more dread,
Sounds the loud trump that wakes the dead."

And the triumphant coming of the Lord as the Bridegroom is believed in the most literal manner, and their voices ring out—

"Who shall drive the hosses
When the Bridegroom comes?"

with a wild earnestness that is startling in its effect. Some of their more monotonous and sadder hymns have a certain slow cadenced whirr in the time which reminds one of a spinning-wheel accompaniment; and undoubtedly many were sung while the women spun and wove.

"Lord, send me wings, and I'll fly home
To the New Jerusalem!"

is the oft-repeated chorus to one of these.

No one can live in the South without growing familiar with these peculiar musical airs. You hear them from the nurses as they put the babies to sleep, from the kitchen, the field, the corn crushing, the road, the church; the watchers by a sick bed croon an old tune as they sit up, and on Christmas night they solemnly watch the dawn come in with prayers and wild hymns.

I have never been able to discover among any of them any story of their native land, any memory of Africa, or any desire to return. They have by no means thoroughly acquired the English language and phraseology. Indeed, Mrs. MALAPROP fades into insignificance beside many of them. One enthusiastic old negro woman, whom I knew, dated every event from the "*vaccination* (meaning evacuation) of Richmond." Another respectfully spoke of the Penitentiary convicts as "*converts*," and one old negro man, with a low bow, and his hat, or a fragment of a hat, held deferentially in his hand, assured his mistress that "Before I do anything, missus, I always *insult* the Master" (for *consult*).

With all their peculiarities the negroes are generally a docile, kind-hearted, simple race with a ready sympathy which renders them invaluable as attendants in a sick-room or nurses to children. Little folks are always attracted by them, and no hours of a Southern girl's or boy's youth are more delightful than those spent listening to his "Mammy's" wonderful narratives. The passage from "Aurora Leigh," which a friend of mine has quoted in regard to them, is truly descriptive for

"They know a simple, merry, tender knack
Of tying sashes, fitting baby-shoes.
And training full sense into empty words."

and the moral which Mrs. Browning draws, is well worthy of being regarded in these days of too early education.

"Children learn by such
Love's holy earnest in a pretty play."

nor lose a single bloom of the simplicity and innocent ignorance of their first fresh years.

JENNY'S ECONOMIES.

J. E. M'CONAUGHY.

"THAT is too good a broom to scrub a porch with, JANE," said Aunt LIDDY reprovingly, looking over the tops of her iron-bowed spectacles.

"Oh, this isn't my best broom, Auntie," said JENNY cheerily, as she scrubbed away.

"It is good enough to be," said Aunt LIDDY. "Haven't you a poor one?"

"Oh yes, several. But it is hard work to scrub with a worn-out broom."

"Ah, that's the difficulty," said Aunt LIDDY, with the air of a cat that has caught a mouse. "Afraid of hard work! That is the way with young people, nowadays. They can't afford to be saving, because they begrudge the labor."

"But I consider myself a *very* saving housekeeper," said JENNY, with a twinkle of her blue eye. "I save myself all I possibly can."

Aunt LIDDY looked a volume of indignant rebukes and protests. In her day and generation, a woman was considered smart and capable according as she overdid herself in works of supererogation, day by day, just as a man was accounted famous according as he lifted up his arm against the thick trees. Such heresy as "saving one's self" was unheard of in those good days.

"I don't wonder young men are afraid to marry," said Aunt RUTH, piously.

"That is their say," said JENNY. "The fact is, the girls are afraid to accept them, they are such an extravagant set at the present day. All but HORACE," she added.

"I am afraid HORACE will find it hard work making headway," said Aunt RUTH, with a sigh and a downward pucker of her mouth, "when you are so opposed to hard work and so wasteful about your brooms."

"Come, Auntie, take this easy rocker," said JENNY, as she washed and dried her pretty hands, of which she took most excellent care. "Sit down by the east window, and see me make little FANNY a slip before she wakes up. I have to sew spry these days, but I can, with such a sprite as this sewing machine. You see, Auntie, it is just HORACE that has put me up to this kind of saving I am telling you of. 'Save yourself, JENNY, all you possibly can,' he says. 'I want you to last as long as I do.' Now, honestly, Auntie, in those hard-working days, of which you tell so much, did not nearly every man have his third wife?"

"It was pretty common," Auntie admitted.

"We both think," said JENNY, as she deftly turned a hem, "that economy of one's health, strength and life-power is the very best economy one can make, and that helps along every other. For instance, how much faster and more comfortably I can turn off this sewing-work, because I have not wearied myself out with trying to scrub that long porch with a stub of a broom. A small illustration, but it will explain the principle. So in dozens of other small matters through the day. Because I take good care of my hands, I can wash far more swiftly and neatly than if I let them get hard and stiff by bad usage. They look prettier, too," she said honestly, looking at the swiftly-flying fingers with evident satisfaction.

"We are pretty ambitious, auntie, and it is a little hard to stop work sometimes when we ought to. I *have* washed and ironed the same day, but I have decided not to do it any more, because I think it is wrong. Bring a strong sense of duty to bear on any subject and it makes it easier. I intend to preach my kind of economy among my young housekeeping friends, and I think, Aunt LIDDY, I could have preached it to you, in your younger days. How many of these aches and pains and weary days and nights it would have saved you, if you had only practiced this wise economy in your youth."

Baby FANNY now put in her protest against mamma's work, and the economy sermon came to an end.

A MOTHER'S INFLUENCE.—It is hard for a young mother, who has not yet overcome the wayward tendencies of her own youthful nature, to realize the influence she exerts over her little ones. She is constantly surrounded by critical imitators who copy her morals and manners. As the mother is, so are her sons and daughters. If a family of children are blessed with an intelligent mother, who is dainty and refined in her manners, and does not consider it necessary to be one woman in the drawing-room and an entirely different person in her every-day life, but who is a true mother, and always a tender, charming woman, you will invariably see her habits of speech and perfect manners repeated in her children. Great, rough men, and noisy, busy boys, will always tone down their voices and step quietly, and try to be more mannerly when she stops to give them a kind word or a pleasant smile—for a true mother will never fail to say and do all the kind, pleasant things she can, that will in any way help to lift up and cheer those whose lives are shaded with care and toil. The mother of to-day rules the world of to-morrow. Think of it, dear sisters, and guard well your home-treasures.

THE essentials to a little home interior seem to be a shelf with an old vase or two, a plateau, or old dark bronze, or china plate, a casket of embossed brass, a slab of malachite, a slender vase of Venetian glass, supported by a small stand of silver, and the whole softened and subdued by a somewhat near curtain of thick, dusky drapery, swung on a rod in place of a door. Supposing a room not too much out of character with the general ensemble, these objects will certainly lend to it an air of what is considered æsthetic refinement.

Materials for lacquer work can be had of DE VOE & Co. Fulton street, N. Y.

WILL Mrs. BETTIE HARRIS, late of Rural Hill, Tenn., please send her address to FAITH RIPLEY, care of RURAL NEW-YORKER.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

LITTLE ECONOMIES.

THE "kitchen club" held its last meeting for this season at our house yesterday, and the subject of discussion was "little economies," which were chiefly and pleasantly shown to us in MRS. BUNSTER'S article. "There is nothing so plainly shows the character of a housekeeper," she told us, "as the care she gives to small domestic saving. The woman who allows all the grease of the kitchen to go into the swill pail, is guilty of a waste of which she may not be aware, but it *is* a waste. The bone that would make a Frenchman a dish of good soup is too often thrown to the dog with the best part unconsumed, and the choicest parts of our potatoes are, in like manner, wasted by thick peeling. When I hear a housekeeper asking each member of a family for a piece of string, I wonder why no bag, or spool is kept in which the pieces coming from the store could be saved; and when in the March winds the clothes-lines break and the clean clothes trail in the dirt and have to be re-rinsed, I think to myself how much less trouble it would have been to take in the cord after using, thus keeping it clean and preventing rotting by winter rain and sun exposure.

Come back, I called to little four-year old, as he dropped part of a slice of good bread on the snow in his haste, and as I put the remnant away I told him that wilful waste makes woful want, and he might have to say

"Oh! how I wish I had the bread
That once I threw away."

and as I gave the soiled bread to kitty I told the children that our Saviour taught economy in little things even at his feasts; for after he fed the multitude by a miracle, he gave his command, "Gather up the fragments that *nothing* be lost."

When I was a little girl I often saw the housekeeper with her drawers full of linen, yet take a thin sheet, and cutting it through the middle sew together the selvages at the side and then hem the sides cut down, making a sheet almost as good as new. It seemed to me then a small economy among such a plentiful supply. I cannot begin to go through all the cases of waste in each family; experience will teach every housekeeper where she has failed. But we should remember that it is not simply for the *saving* of the trifle, but the example we may be to younger members of our family and the principle we are striving to inculcate. If a young girl sees her mother open the oven door with her apron instead of keeping large fresh linen holders for the purpose, you may be sure that some day she will do the same with her dress, if nothing else is handy, and in that way learn lessons of waste, and untidy habits that will last a lifetime. It is our duty to see that in our domestic affairs each of us obeys the Saviour's mandate. 'Let nothing be lost.'"

We listened attentively to the advice of our neighbor each taking in her own need in the way of special improvement, and as we shook hands at parting with regret we promised each other to renew our pleasant club early in autumn.

DOMESTIC RECIPES.

Buckeye Cake.

One half pound of butter; three-quarters of a pound of sugar; six eggs well beaten; half a pint of sweet milk; one pound of prepared flour; flavor with vanilla.

Puff Cake.

Two cups of sugar; one cup of butter; three beaten eggs; one cup of milk; one teaspoonful of soda and two of cream-of-tartar; three cups of flour; bake in small pans.

Sugar Drops.

Rub to a cream six ounces of powdered sugar with three ounces of butter; add three well beaten eggs; half a pound of sifted flour and half of a nutmeg. Drop this mixture by the spoonful on buttered tins several inches apart. Sprinkle small sugar plums on top and bake at once.

Cocoanut Cake.

One-half pound of sugar; one-fourth pound of butter; five eggs; one gill of sweet milk; one-half teaspoonful of soda and one of cream-of-tartar; three-quarters of a pound of flour; one-half pound of grated cocoanut. Stir well before putting in the cocoanut and soda.

Soda Cake.

One-half cup of butter; one cup of sugar; three eggs; one cup of sweet milk; one teaspoonful of soda and two of cream-of-tartar; two cups of flour; spice to taste.

River Edge, N. J. MISS CRONK.

Corn Bread.

Two cups of Indian-meal; two cups of wheat flour; one cup of sugar; one beaten egg; one teaspoonful of soda; two teaspoonfuls of cream-of-tartar; a little salt, and sweet milk enough to make a thick batter. Bake in shallow pans—it should be when done, about an inch in thickness and eat warm for breakfast. This makes the best corn bread ever eaten according to my taste.

SUBSCRIBER.

Rhubarb Shortcake.

Two heaping teaspoonfuls of baking powder sifted with a quart of flour; one-half teacup of butter; two tablespoonfuls of sugar; a pinch of salt and enough sweet milk to make a soft dough. Roll thick enough so that when baked it can be split open or roll thin so there will be three or four layers. When done, butter and fill with stewed rhubarb plentifully sugared.

Rhubarb Pie.

Stew rhubarb; add the grated rind and juice of a lemon; the well-beaten yelks of two eggs, and sweeten with white sugar; line pie-tins with good crust and fill with the rhubarb; bake until the crust is of a delicate brown; beat the whites to a stiff froth—it will be necessary to add the white of another egg—and add three tablespoonsful of powdered sugar; flavor with vanilla and spread over the top of the pies; return to oven until of a light brown. The eggs and lemon given are enough for two pies.

Baked Rhubarb.

Many prefer rhubarb baked when served as a preserve. Cut the pieces about an inch in length; weigh, allow as much moist sugar as rhubarb and bake in an earthen-ware dish; put into the dish in layers; add a mite of water; cover closely and bake.

Cinnamon Custard Pie.

Beat six eggs thoroughly; add three pints of rich, new milk and a tablespoonful of cornstarch, stirred smooth in a little milk; sweeten to taste and sift in a tablespoonful of cinnamon. Pour into tins lined with crust and bake.

E. M.

QUERIES ANSWERED.

WILL you please give directions for washing *point lace?* MRS. G. S.

ANS.—Baste the lace to be washed very carefully with *fine* thread upon two thicknesses of white flannel. Put to soak in a strong, white castile soap-suds in which a teaspoonful of powdered borax has been mixed. Let soak for a day and night, longer if very soiled, changing the suds meanwhile two or three times. After this let it lie in clear water for half of a day, changing the water twice. Then squeeze—do not wring—the flannel and lace out of this clear water and when partially dry place the flannel, lace down, upon three thicknesses of dry flannel and press the damp side with a moderately heated iron until perfectly dry—the lace can then be ripped off.

How can the taste of cod-liver oil be disguised so that a child will take it?

Plainfield, N. J.

ANS.—Put a spoonful of orange juice in a glass, pour in the oil and squeeze a little lemon juice on top, rubbing the edge of the glass with the juice, or a little porter in the bottom of the glass and on top of the oil helps to disguise the nauseous flavor.

What will polish old black-walnut furniture which has been varnished? JANE B.

ANS.—Take of shellac two parts, boiled oil one part, shake well, apply with a cloth and rub briskly for a few minutes.

If EMILY MAPLE can tell me what will remove match stains from off my marble mantel, I will be very much obliged. GRACE BENINGTON.

ANS.—Sulphide of Carbon.

News of the Week.

NEWS OF THE WEEK.

AT home, Montgomery Blair got his resolution about the Presidency passed by the lower house of the Maryland Legislature, and there is still a good deal of talk in Washington about bringing the matter before the Supreme Court of the United States. Probably the object is merely to keep the question before the public with a view of influencing the next Presidential nominations and election. Returning Board Anderson has been released from "durance vile," and is being vigorously pushed for the Collectorship of New Orleans—nomination not improbable, confirmation nearly impossible. Returning Board Wells is in his war-paint in Washington urging the nomination. There is a powerful railroad lobby at Washington in favor of the Union Pacific Railroad, and Senators Edmunds and Thurman made a bitter attack early in the week upon the manœuvers of the lobbyists. A majority of the Committee of the House in charge of the question, have reported in favor of electing all future Presidents by a direct vote of the people without the intervention of "Electors," and of giving the office to the candidate having the most votes throughout the country, without regard to the division of States. At present a President can, and often is, elected by a majority of States though his beaten opponent has had a majority of the popular vote. A terrible collission of oil and freight trains at Slatington, Pa., 22 killed and wounded. At Boston, a terrific boiler explosion in a stamping factory hurled the boiler through a brick wall, an outside wooden wall, across a canal 130 feet away, sweeping three men to destruction with it, wounding another fatally and six more severely. The "National Party," made up largely of farmers, have shown very unexpected strength in Michigan—indeed, wherever farmers have combined throughout the country, they have either swept the field or nearly so. At Bath, N. Y., the Insane Asylum was set on fire by a frantic patient, the building burnt, and fifteen of the inmates lost, and over forty rescued.

Across the Atlantic things have a slightly less belligerent aspect. From the Iron Man at Berlin comes the suggestion that the projected Congress which, last week, was held to be an impossibility, should soon assemble, and, to spare Muscovite pride while yielding to British and Austrian demands, that the treaty of Paris as well as San Stefano should be reviewed. The suggestion may be adopted, as it is so powerfully backed by the character of its proposer. Austro-Hungary, especially the Hungary part of it, is steadfastly opposed to the late treaty, and Hungary would go to war rather than permit a Slave State to be established on her southeastern borders. England is still pressing war preparations and never had so much ammunition, military stores and troops on hand as at the present time. She is about to seize Crete, and has induced the Khedive of Egypt to declare that if Turkey forms an offensive alliance with Russia he will declare his independence. Over 100,000 Turkish troops have been concentrated about Constantinople, and it is believed they could hold the city against the Russians until relieved by British reinforcements, in case of war and their alliance with Russia's enemies. Roumania is fiercely opposed to Russia on account of the latter's peremptory demand for the retrocession of Bessarabia. The Premier of that State has visited Vienna on the matter and is now in Berlin. Gortschakoff haughtily said he would listen to no discussion of the matter, but would disarm the Roumanian army, whereupon Prince Charles hotly declared that the Roumanian army might be destroyed, but that in his lifetime it should not be disarmed. The campaigning season is just about to open, both sides are pretty well prepared. The English and Russians are at the boiling point, and it will require strong outside pressure to prevent a collission. Russia has 200,000 men within striking distance in Turkey, is occupying strategical points in Bulgaria, recruiting her forces at home, and is said to have 200,000 men to the southeast of Khiva, on the road to British India. France, while expressing herself friendly to Russia, has declared she will form no alliance in any way hostile to Great Britain.

The Co-operative Employment Bureau of the Bowery Branch, Young Mens' Christian Asssociation, 134 Bowery, have abolished the fee of one dollar which they lately charged. Employers of labor can now be furnished with male help of all kinds free of expense. Unemployed men can register for situations, but responsible references must be given.

At Cannes, in front of a small boot-maker's shop, the English tourist may find the following: "Repairs hung with stag-coach." After long and anxious thought he may arrive as the cobbler's meaning, who only wishes to inform his numerous patrons that "repairs are executed with diligence."

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO. Cincinnati, Ohio.

CORINTH, Maine, Feb. 12, 1878.

TO THE DAVIS SEWING MACHINE CO., Watertown, N. Y.—*Gents:* We are manufacturers of clothing; have been engaged in the business for the past fifteen years, manufacturing largely for Miner, Beal & Hackett, Isaac Fenno & Co., A. Sherman & Co., Smith, Richardson & Bates, Prager, Bock & Co. and Leland, Rice & Co., all of Boston. We have used the Davis Vertical Feed Sewing Machine for the past four years in manufacturing our clothing, and we know that it is better adapted to our business, and possessed superior advantages over any of the under-feed sewing machines.

Within the last three months we have had occasion to seam our clothing with double thread, and we find that the Davis Vertical Feed Sewing Machine (and no other family sewing machine) will do the work as well and easily as with the single thread. Yours, truly, T. BRACKETT & SON.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 6, 1878.

BEESWAX.—The offerings are small, and full prices are asked. Western and Southern quoted at 27@28c.

Exports past week, 6,250 pounds.

BROOM CORN.—Manufacturers are buying moderately and prices are sustained.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 4@5½c.; red-tipped, 4@5c., and common red, 3@3½c.

BEANS AND PEAS.—Beans of all kinds begins to improve for marrows but other grades are unchanged Perhaps it should be remembered that there is less pressure to sell fine mediums at the late low rates. Fair orders are expected from Havana for marrows and White kidneys. Turtle soup beans higher. Receipts of beans for the week 3418 bush. Peas of all kinds weak; green lower. Canadian field in bulk and vine 83@84c.; Southern B. E. $2 80@3; green $1 22.

We quote:—Beans, medium choice, $1.50@1.55; other, $1.25@1.45; marrows, choice, $1.60@1.65; other, $1.50@1.55; pea, $1.50@1.65. White kidney, choice, $1.25@1.55; other, $1.85@1.95; red, choice, $2@2.35; other, $2.35@2.40. Turtle soup beans, $2.20.

BUTTER.—New butter now absorbs the chief local demand when full prices are to be paid. The fine lines of old are not obtainable in a regular way, and all of the useful styles of old are offered easier. In some parcels not as prime, full dairies and serviceable half tubs the decline has been quite abrupt, but no one has dropped too soon, as a settled spring is now beyond a doubt, so far as dairy products are concerned. New butter is increasing in supply from all points, the West adding materially to state. Prices are showing daily as much of the fodder fed grades soon deteriorate in flavor, and it is injudicious to carry it over. Exporters are working off many of the low grades, but have to be allowed their ideas as to price. Receipts for the week 18,600 pkgs.

Exports past week, 1,580 pkgs.

Comparative receipts and exports:

	Receipts, pkgs.	Exports, firks.
June 1, '77, to Apr. 1, '78...	1,088,970	16,068,0
June 1, '76, to Apr. 1, '77...	10,852,230	1,135,469

June 1, '73 to Apl. 1, '74.....	1,869,680	84,904,163

LITTLE FALLS.—There has been an increase in offerings. Cheese is of poor quality and few transactions recorded. Butter averages about 25c.

COTTON has fluctuated sharply as the advices from the other side have been favorable or otherwise, closing about ¼ above the lowest prices of the week. Latest prices are for March, 10.62@10.63c.; April, 10 74@10.76c.; May, 10.89@10.90c.; June, 11.00@11.01c; July, 10.09@10.10c.; August, 11.01@11.02c.; September, 10.95@10.96c.; October, 10.75@10.76c.; November, 10.66@10.67c.; December, 10.68c.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary, 7¾c. Strict ordinary. 8⅛c.; Low middling, 9c.; Middling, 9⅜c.

DRIED FRUITS.—There has been a very dull feeling throughout but prices fairly steady.

Apples—State quarters, old, 5¾@6c.; new, 5¼@6c.; Western quarters, old, 5@5¾c.; new, 5¼@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 4½@5c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@16c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c. Exports for the week 153 bbls dried apples.

EGGS.—Receipts for the week, 24,372 bbls. do. last week 22,890. There has been an active demand but mostly for local use, and as receipts are heavy sellers miss the customary trade to other cities. Present prices have ruled nearly a fortnight, at the close there is some firmness for extra stock but the general run of grades are offered freely. Since the plan adopted of not charging for barrels some shippers are sending poor packages. This is unprofitable in the long run as wastage is sure to attend insecurely packed bbls.

Near points, 11@12c.; State, 10½c.; Western, prime, 10c.; Southern do., 9@10c.; off quality stock, 9c.; Duck, 18@20c.; Goose, 35@40.

FLOUR.—In the early portion of the week while the situation abroad looked very threatening on active business was in progress largely for export, but within a day or two a quiet feeling has prevailed and prices easing are off.

Latest prices are $4.15@5.00 for poor to fancy superfine State; $5.00@5.20 for common to fair extra do; $5.00@5.25 $5.20@5.60 for good to choice do.; $4.15@5.00 for superfine, Indiana, Iowa, Michigan, Ohio, &c.; $4.90@5.20 for very poor to good shipping extra do do., (chiefly at $5.10@5.20) and $5.25@5.65 for good to choice extra do.; common to choice white extras, $5.50@5.65; fancy do. at $5.54@7.50; (the latter an extreme); red and amber winter wheat, inferior to choice trade and family, at $5.35@6.50; round hoop Ohio at $5 00@5 35, and trade brands of at do. $5.50@6.75, the latter for choice; St. Louis, $5.40@6.00 for poor to fair extra and $6.10@7.25 for good to fancy; (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, $5.00@6.15; Minnesota "straight," common to fancy, at $5.75@6.75, and patent poor to very choice, $6.00@8.25, with a few fancy at $8.75@8.50; unsound stock at $2.25@5.75; city mill extra at $6 10@6.25 for fair to very choice for West Indies; do. for England $5.15@5.20; do. trade and family extras, $6.50@7.10; do. South America, $6.40@7.35 for fair to fancy; No. 2 at $2.85@4.10.

Corn meal is selling at $3.15@3.20 for Brandywine and $2.80 for yellow Western.

FRESH FRUITS.—Exports of apples 275 bbls. The stock is quite run down and all sound stock is firm; demand mainly for Russets. Other sorts too tender for the advanced season. Selected, $4 50@5; poor to fair, $2.25@4. Strawberries arrive regularly and in quantity. Prices becoming more popular, 40@60c. per quart. Hot-house berries $1. Cranberries dull but likely to be used. Prime to fancy crates, $2.78@3; other, $1.75@2.50. Peanuts fairly active at $1.35@1.45 for hand-picked Va., common to good 85c.@$1.00. Pecans, Texas, 6@8 lb.; A novelty in market this week was a consignment of large Mulberries from Florida. Some of them fully one-half inches long.

FURS AND SKINS.—The tone of the market for raw skins continues weak; and the advent of war in Europe would tend to completely silence trade here.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₩ piece	$3 00@4 00	$2 00@2 50
Gray Fox	40@45	40@45
Red Fox	75@80	60@65
Black Bear	5 00@6 00	4 00@5 00
Brown cubs and yigs.	1 00@2 00	1 00@2 00
Florida deer skins.	15@18	
Fisher	5 00@6 00	4 00@5 00
Mink, dark	85@1 00	50@60
pale	50@60	30@40
Muskrat, wintor	8@10	6@8

Opossum	3@6	3@6
Skunk, black		50@60
striped		7@30
Wolf, mountain		1 50@2 00
prairie		50@60

Southern raw skins are worth 20 per cent less than Western.

HOPS.—The export movement has been very small this week, but prices steady and unchanged.

State choice to fancy, 11@12c.; good to prime, 8@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

HAY AND STRAW.—The arrivals are larger, but demand is fair and prices sustained.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

Exports since Jan. 1st, 17,250 bales; same time last year, 14,850 do.

GRAIN.—Wheat since our last report has been very much excited, with large transportations, representing chiefly export purchases, and prices advancing, are wholly due to the situation; around here for the last day or two a graver market has been noted and prices easing a little.

Latest sales are of No. 2 old at 60c—ungraded red and amber State, $1 45@146—; white, $1 47; No 1 Northwest spring, $1 27; No. 3 Chicago, $1 22½; No. 2 red for March at $1 23; No. 2 Milwaukee spring, $1 27. Rye has been very active, purchases within a week reaching fully 250,000 bush. largely for the German markets, closing at 72c. for Western; 76@77½c. for State and 76c. for Canada. Corn is weak and quiet. Latest sales are of New York No. 2 at 54@55½c.; steamer mixed, March, 54c. Oats of New York extra white, at 34½@40c.; do. No. 1, March 34½c.; No. 2 white, 35½c.; mixed Western, 34@34½c.; white Western, 36@39c.

All articles have been affected by the situation abroad, and with an active inquiry from exporters prices are much higher; latest sales of wheat are of ungraded spring at $1.20@1.25; bush. No. 3 spring at $1.22@1.22¾. No. 2 northwest spring at $1.28@1.09; New York No. 2, spring at $1.27@1,27½; Chicago spring at $1.29; No. 2 Milwaukee spring at $1.29@1.30,; No. 1 Milwaukee and Minnesota spring at $1.34@1.35; ungraded red $1.135@1 36; No. 1 red at 1.38; No. 1 white at $1.42, white State, at $1.46@1.47; No 2 red, March delivery, at $1.3?; No. 2 red, April delivery, at $1.36½@1.37; New York No 2 spring, March delivery, at $1.23½@1.29; do., April delivery, at $1.26½@1.27; do., April delivery (in store), at $1.27; No. 2 northwest spring, March delivery at $1.30; Rye at 72@74 for State, and 73 for Great Western.

LEATHER.—Hemlock sole quoted 319@21; for light 19@21c. for middle, 19@21c. for heavy and 17½@18c. for good damaged.

MAPLE SUGAR.—The supply is liberal and the low rates of 8@10c. should work it off faster. Retailers keep the market slow by aiming for too large profits.

OIL-CAKE.—Western is quoted at $30.50 ₩ ton.

POULTRY AND GAME.—Trade in live is light to killers and free Western and Northern receipts over stock the market with fowls and turkeys.

N. J. chickens, 10@13c.; W. fowls, 9@10c.; Turkeys, @12c.; Toms, 6@8c.; Ducks, N. J., pair, 50@75c.; Geese, N. J., $1.75@2.00; Western, $1.00@1.50.

Cheap live poultry keep country killed low. Receipts of dressed, however, are moderate and there is not much interior interest at this time of the year. Ducks very scarce. Only choice small turkeys have any sale.

Fancy Phila. and N. J. turkeys, 12@14c.; good, 8@9c.; large or Toms, 8@10c.; chickens, choice, 8@9c; good, 12@14c.; common, 8@10c.; ducks, choice, 15@20c.; other, 21@22c. small and slips, 27@28c.

Wild pigeons have been abundant and low; to-day they are firmer.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $1.25@1.50; Red-heads, 60@80c; Mallard, 50@60c.; Teal, 25@40c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$1.00. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS.—Hog products generally have varied but little, closing steady.

Mess pork, $10.15@10.25 for spot lots; $9.90 @ 10 for March and April. Bacon at 5¾c. for long clear and 5¾c. for short clear. Lard—Western steam, 7 37½c. 7.40c. for short, 7.44@7.45c. for May, 7.37½@7.40; Tallow at 7 9-16c. for prime. Stearine, 7¾c. for prime Western. Beef hams at $15.50. Beef—New extra mess, $12.@12.25; plain, $10.50@11.50; new packet, $15. family mess, $17.50; extra India mess, $27 for city brands; do. Philadelphia, $25.

SEED.—Grass are weak. Clover, 7@7½c. for Western; 7@7¾c. for State. Timothy, $1.40. Rough flax, $1.45.

TOBACCO. — The new crop comes in more freely, and export demand is better.

VEGETABLES.—Exports past week 2,380 bbls. Potatoes are quiet; outside rated sell quicker than off quality. It is thought a good many common will be lost as potatoes have had a trying carrying season.

We quote Peach Blows $1.25@1.62, bulk and doubleheads. Early Rose, $1.00@1.25; Peerless, $1.25@1.50; Nova Scotia, $1.95@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.00@1.25; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₩ ₺., 40@50c. Radishes, 100 bunches, $4@4.50. Lettuce, small, dozen, 75c.; large, $1@$1.50. Cucumbers, doz., $2.25@2.75. Rhubarb, doz., $7@8. Spinach, Southern, @2.25 ₩ bbl, Bermuda, $4.00@5.

WOOL.—There is a depressed and dull market still on account of the slow trade in goods and the small transactions are at easy prices,

Ohio, Pennsylvania and Virginia—XXX and pick-lock, 41@46c.; XX, 42@44c; X, 42@43c; No. 1, 43@44c. No. 2, 35@37c.; common, 32@35c.; combing, 52@55c.

New York, Michigan, Indiana and Wisconsin—XX, 34@36c.; X, 36@38c.; No. 1, 38@40c.; No. 2, 33@35; common, 32@34c.; combing, 44@48c.

Iowa, Vermont and Illinois—X and XX, 33@35c.; No. 1, 37@40c.; No. 2, 31@33c.; combing, 45@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 37@42c.; unwashed, 25@30c.; unwashed combing, 30@35c.

LIVE STOCK MARKETS.

NEW YORK, April 6, 1876.

BEEVES.—Receipts for the week, 9,253 head: do., last week, 9,563 do. There was an active buying feeling, and the moderate supplies were easily closed out. There was no disposition, however, to pay strong prices and a range of 8¾@10c. with a number of car loads at 9¾@9¾c. expresses the market for useful to prime steers. Aside from the regular butchers' business at the above prices, selections of special stock for export brought 10¾c.: Rough State oxen sold at 7¾c.; Texas oxen, 8c.

COWS AND CALVES.—The bulk of the sales were at $35@55; occasional singles $60@70 but stock equal to the latter in quality is worth about as much in the interior for new milk.

VEAL CALVES.—Receipts, 1,348 head; do last week 1,218. The demand for live moderate at 5¾@7¾c. for good to choice; bulls held at $1.50@3 50 per head. The Sanitary Board seizes all under 60 lbs. weight. Hog dressed calves 5@9c.

SHEEP AND LAMBS.—Receipts for the week, 16,324 head; do. last week, 16,459 do. The market has ruled weak and broke on Thursday last. Medium to good wool sheep, 5¾@6½c.; yearlings, 7@7¾c. Some holders withdrew their stock at the prices. Spring lambs at Washington Market $3@6 per head.

SWINE.—Receipts for the week, 32,377 head; do., last week, 17,405 do. Market steady $1.06¾ per 100 quoted last for Ohio country dressed quiet at 4¾@5¾c. for heavy to pigs.

HELP!
FOR THE WEAK, NERVOUS AND DEBILITATED!
The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.
PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,
For self-application to any part of the body, meet every requirement.
The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S
ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years. Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

PULVERMACHER GALVANIC CO.,
Cor. Eighth and Vine Sts., CINCINNATI, O.

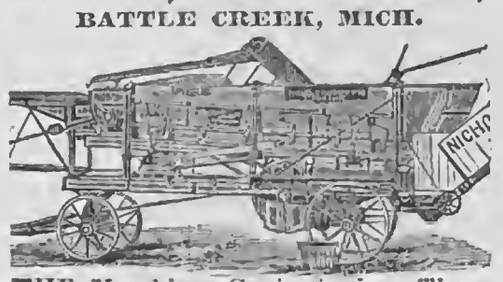
TRADE MARK.
'VIBRATOR'
Reg. March 31, 1874.

THE ORIGINAL & ONLY GENUINE
"Vibrator" Threshers,
WITH IMPROVED
MOUNTED HORSE POWERS,
And Steam Thresher Engines,
Made only by
NICHOLS, SHEPARD & CO.,
BATTLE CREEK, MICH.



THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all Rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

GRAIN Raisers will not Submit to the enormous wastage of Grain & the Inferior work done by the other machines, when once posted on the difference.

THE ENTIRE Threshing Expenses (and often 2 to 5 Times that amount) can be made by the Extra Grain SAVED by these Improved Machines.

NO Revolving Shafts Inside the Separator. Entirely free from Beaters, Pickers, Raddles, and all such time-wasting and grain-wasting complications. Perfectly adapted to all Kinds and Conditions of Grain, Wet or Dry, Long or Short, Headed or Bound.

NOT only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes no Litterings or Scatterings.

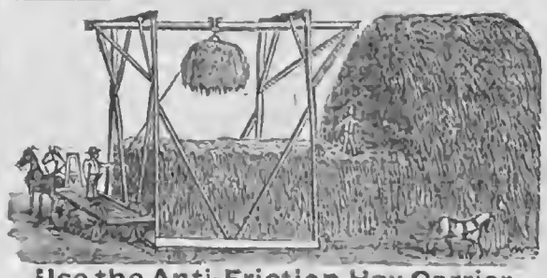
FOUR Sizes of Separators Made, ranging from Six to Twelve Horse size, and two styles of Mounted Horse Powers to match.

STEAM Power Threshers a Specialty. A special size Separator made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, with Valuable Improvements and Distinctive Features, far beyond any other make or kind.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "VIBRATOR" Thresher On Gits are Incomparable.

FOR Particulars, call on our Dealers or write to us for Illustrated Circular, which we mail free.



Use the Anti-Friction Hay Carrier.
For elevating and conveying Hay, Grain, etc., in Barn, Derrick, Shed or Field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high fences and into the mow or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "B" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

USE THE PERFECT BUTTER COLOR! WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

CHEAPEST FERTILIZER.
BECAUSE THE BEST.
PREMIUM BONE
For all crops. Made only by the EXCELSIOR FERTILIZER WORKS, Salem, O. Circulars free.

FOR ALL LUNG TROUBLES, *as well as Complaints of the Throat, Dr. Jayne's Expectorant is certainly a palliative and often a curative, as the testimony of thousands and its world-wide reputation attests. For Coughs or Colds no surer or more effective remedy can be found.*

Reading for the Young.

MY LOVER.

EMMA MORTIMER WHITE.

At last I am blessed with a lover,
Just what a lover should be—
Devoted and constant, and handsome.
Handsome as handsome can be.

Devoted!—devoted, believe me!
He never has left me a day;
I am ever his pride and his darling—
Without me he cannot be gay.

He cares for no lovelier lady;
To him I am very fair;
Contented he rests on my bosom,
Kisses my lips and my hair.

Handsome!—his cheeks are like roses.
His head is run over with curls,
His forehead is as white as a snow-drift,
His teeth glimmer clearer than pearls.

His eyes, they are bright as the sunshine,
With lashes that cannot be beat,
And then I know that you've never
Seen such hands and such feet.

Wealthy? He's careless of money—
Money to him is but dross;
Silver and gold, for my lover,
Are only for pitch and for toss,

He must have been born to a fortune—
He's lived at his ease ever since;
If you'd see but the style of his dressing,
You'd probably think him a prince.

Shirts thick frosted with stitching,
Silken embroidered socks;
I think the most of his money
He keeps in a painted box.

He'll show you a golden guinea
On which he cut his first tooth,
Strung on an azure ribbon,
Tied with a love-knot, forsooth!

Of teeth he has half a dozen,
Set to the cunningest mold;
For I am my lover's mother—
For he is but one year old!

LETTERS FROM BOYS AND GIRLS.

How to Make Candy.

DEAR UNCLE TRUE.—I see that several of our Cousins would like to know about making candy, and I am happy to tell them, because it is fun to make it and fun to pull it and more than fun to eat it. But just let me tell "Brown Badger," that he can make corn balls out of sirup, either maple or West India, just as well as out of sugar, only he will have to boil it longer. The balls do not look quite as nice, but they taste just as well, and Grandmother says, the "proof of the pudding is in the taste;" so with corn balls.

Now cousins "Lizzie," and "Jennie," we will talk about candy. I suppose you will not start on a great quantity at first, so we will take a pound of granulated sugar to commence with; then your corn, when you choose, double or quadruple the amount. Take one pound of white, granulated or coffee crushed sugar, put into a porcelain kettle, dissolve two spoonfuls of cream-of-tartar in half a teacup of warm water, turn it in with the sugar, set it on the stove, and let the sugar melt slowly; when melted, set it over the fire, and let it boil quite fast. To know when it is done drop a little into a cup of cold water; if it sinks in a little ball to the bottom of the cup, it is done; now is the time to put in your flavoring; you can use essence of peppermint, cinnamon, sarsaparilla or extract of lemon, you will need two tablespoonfuls to flavor the quantity you are making; stir it well into the boiling sugar.

Butter a deep platter, and turn the sugar from the kettle, into the platter. Have your hands clean, and rub a little butter over them; and when the candy is cool enough to hold, take as much as you can handle into you hand; look out, and do not burn your fingers, for that would spoil the fun. There ought to be three to work at it at one time; now commence to pull it gently, and work lively; as it grows colder, and more elastic, you can put it all together, and all of you pull on it; it will at first be a cream-color. Some like it so better than to pull it till it is snow-white; you must not taste of it too often while pulling it; because it evaporates very quickly, if you begin to let it; when it grows brittle and hard, take a sharp knife, and pull the candy into strips, and cut it off, in equal lengths, and lay it on the buttered platter, set it in a cool place, and you will have some splendid candy; and will be pretty likely to have permission to practice the art, quite often.

For lemon drops, make your candy, and season it with lemon extract, if it is winter have some snow packed in pans, and drop the candy on the snow to cool; if in summer, a cake of ice will do just as well; you can drop it from a spoon, in large or small drops, or turn it through a tin collander, they are just luscious, and they are clear as crystal.

Maple sugar candy is made with the same recipe, only instead of cream-of-tartar we have to use sharp vinegar, this is to keep the fluid from graining, instead of being stretchy. Some people use tartaric acid; it is not good for the teeth, as it destroys the enamel and makes it crack, the teeth decay and ache. Fresh lemon juice is the best acid, but you cannot always get them, so we use cream-of-tartar instead.

Molasses candy is made of West India molasses, with vinegar in it; a half cup of vinegar to a quart of molasses and pulled just like our sugar candy.

Once upon a time, not very many years ago, some cousins of mine,—they were none of Uncle TRUE'S correspondents, but my own kin,—came to stop a few weeks with us. Father and mother went away to be gone a few hours and we asked them if we might make some molasses candy in the evening. Mother said, "Yes, if we would be careful and not get burnt or spill it over the stove." She told us to take a quart of molasses and put it into her six-quart porcelain kettle. I knew how to make it and promised to do all right.

Well, we started it; but the kettle was so big that the molasses looked small and so one of the boys said there would not be enough to go round, and they took a jug and went to the store and got a gallon more and turned it into the kettle, made up a good fire and while we were waiting for it to boil we got to play and forgot all about it and the first we knew, it boiled over and ran all over the stove and floor. Just think how I felt! I had never tried to mop a floor but that was the first time! We had good candy of what was left in the kettle but it did not taste very good to me, and every step I took my feet stuck to the floor; and the rest were just as bad.

When mother came home she was astonished. You never saw such a looking house! We had tracked the molasses on to the sitting-room carpet and everything we had touched with our hands stuck. I knew mother would not scold; but I was grieved to see how hard she had to work to clear it up. She showed me how to clean the chairs; but it was a sorry job for all of us. The reason she had us take so large a kettle was, that it could not run over; but when you put a gallon of molasses into a six-quart kettle, no wonder it ran over.

I never forgot that candy meeting; and the boys didn't either. It was a good lesson for all of us.

LILLIE LEE.

One Boy's Experience.

IN a city not a great many miles from Cleveland, lives a boy whose experience may help to counteract the pernicious effect of the mass of sensational literature furnished to the boys of to-day.

His parents are in comfortable circumstances, and the boy has never been remarkable for anything except a mild form of laziness, which exhibited itself in a disinclination for either work or study. He was kept in school so long as he learned anything, and then entered a store as errand boy.

Here his spare time was spent in reading papers (?); his spare cash devoted to their purchase. He learned from the fascinating stories furnished by these "papers" that the hero always began his wonderful career by running away from home. It was the correct thing to begin at the bottom of the ladder. If the boy lived near the sea, he invariably enlisted as cabin boy, and, after years of hardship and danger, returned to the poor town of his birth with untold wealth, and a vocabulary of profanity absolutely horrifying to the "old fogies" who lived honest lives and tried to do as they would be done by.

If the hero lived in some inland town, he ran away to the nearest large city and began his career as newsboy or bootblack. The laws of nature, the laws of trade, the laws of society, were set aside for his especial benefit; and from his lonely position he rose by a series of impossible advontures and occurrences to wealth and power and notoriety.

So, after a while, our would-be hero, having accumulated a few dollars, provided himself with all the apparatus of a first-class bootblack, and started for Cleveland. A note left behind, informed his parents that he had "gone to seek his fortune."

No sooner had he shown himself in Cleveland, however, than the young bootblacks of that city sought him with a zest and earnestness wholly unexpected by our hero. In about fifteen minutes all desire for the life of a hero had left that boy, together with his coat, his blacking-box, his hat and the contents of his pockets. In return he gained nothing but a black-eye and a bloody nose.

The police finally rescued him and, instructed by a telegram, sent him back to his father a sadder and an infinitely wiser boy.

A CONTRIBUTOR.

Instruction and Comment.

DEAR RURAL COUSINS.—Noticing in a late RURAL that "Bitter Sweet" would like to know how to make paper flowers, I will try and tell her how to make roses. I do not know how to make any other kind.

Take tissue paper and cut fifteen round pieces, of three different sizes, each size about an eight of an inch smaller than the preceding one. Make a small hole in the center of each, and cut into each piece eight slits, (care should be taken not to cut them too deep so they will tear out,) slightly rounding the corners. Next, take a fine wire and wind it with green paper, (the color of the rose,) and tie over it a smooth piece to make it round; then slip the pieces on the wire. When this is done, cut the same kind of a round piece as the other from green paper, only a great deal smaller, and put that on last. It is to represent the outer leaves of a rose, I have made them this way and they are very pretty; but if any of the girls know of a better way I should like very much to hear of it. I hope that I have explained it so that "B. S." can make roses without difficulty.

One thing I should like to say to the Cousins is this, I think it a perfect shame after the Editor has so kindly given quite a space, in his worthy paper for the benefit of the young people, that it is filled week after week about nothing but one of the Cousins, who is undoubtedly no worse than a good share of us. I am sure I would not give much for a person who did not have some conceit, of course I do not believe in too much of a good thing, but probably it is just as natural for "Slayerofconceit" to be self-conceited, as it seems to be for the other Cousins to run theirs down. Now I say let us change the subject, and allow him rest, for a while at least. Why isn't it just as easy to talk about books, fancy work and a host of other things? I am sure it would be far more interesting. I wish some of the Cousins would write and tell how to make some kind of fancy work. I have made considerable and perhaps some time will write and tell of some of my attempts. Until then adieu. MYRTLE.

Fredonia, N. Y.

How to Fill the Basket.

"I DON'T see why I can't get this lesson," exclaimed FRANK impatiently as he looked up from the grammar he was studying.

"I know," said KATE, "your head is too full of trash to hold your lesson." FRANK looked puzzled. "Well I'll explain," said KATE laughing; and taking a small basket she filled it with chips; then with a very wise look on her young face, she proceeded to the pantry and brought a pan of apples which she placed beside the chips.

"Now, FRANK, this basket of chips is your head—"

FRANK laughed.

KATE seeing her mistake blushingly tried to explain that she wanted the chips to represent the nonsense in his head, and the apples to represent his lessons. "So you see in order to get the apples in you must empty out the chips." She had now gone as far as she could, but FRANK becoming suddenly interested, emptied out the chips and filled the basket one by one with apples. As he did so a shade of disappointment crossed his face.

"The basket will at last be full," he murmured, and suddenly all his exalted notions about being a great man were dashed to the ground.

"Oh I know how you can get more apples in the basket," exclaimed KATE joyfully, "just peel them."

"That's so," said FRANK, "and then we could quarter and core them; by that means we could get more in, besides what we did have would be the real stuff." Still as he saw in his imagination the basket of quarters, he was not satisfied. He stood looking at them for some time, then suddenly his face brightened. "I see," he exclaimed, "I'll dry the quarters." He picked up his grammar, and went on with his study with a satisfied air.

GRACE GOLD.

The Puzzler.

ENIGMA.

My parents bred me to the sea;
I've been where man could never be.
Oft times I've raged the ocean wide,
Where all force of storms I defied,
And lowering clouds obscured the sky,
And foaming billows mounted high.
I left the sea, grew fond of show,
Dressed neat, and soon became a beau.
I, like a bridegroom clad in white,
Among the ladies, I delight.
No more a seaman bold and rough,
I shine at balls and am fond of snuff.
I attend when Chloe goes to rest—
Chloe is by my presence blest;
No ghost nor goblin can she fear,
Nor midnight hag, when I am near.
At length a burning fever came,
Which quite dissolved my tender frame,
And I at last light headed grew,
Of all my friends not one I knew,
Great drops of sweat ran down my side,
And I at last by inches died.

"THE CHURCH OF THE FIRST-BORN.

(PARAPHRASE FROM PSALM 87.)

On the holy mountains founded,
Zion stands adorned with grace;
God her walls and towers hath bounded;
Shines on her, His smiling face,

Well Jehovah loves his Zion,
More than all on earth beside;
His, is love to her undying,
'Twas for her that Jesus died.

Glorious things of thee, oft spoken,
Fill the bright prophetic page;
He, whose pledge has ne'er been broken,
Stand thy guard through every age.

Babel, Tyre, each haughty nation,
Once thy foes—now, 'mongst thy sons,
Soon will share thy great salvation,
When thy day of Glory dawns.

But O Zion (wondrous story,)
When thy splendors eye shall see—
Earth shall boast her chiefest glory,
That her sons were born in thee.

Aye, 'twill never be forgotten,
When the Lord makes up his count,
That his chosen were begotten,
Each one in thy Holy Mount.

Well Jehovah will remember,
When he notes the sons of men,
That in thee, each mystic member,
Of his house was born again.

Then let earth's high princes, Zion,
Joyfully thy praises sound;
For in thee, the never-dying,
All our springs of joy abound.

[*Christian Observer.*

TALENT AND TACT.—Talent is something; but tact is everything. Talent is serious, sober, grave and respectable; tact is all that, and more too. It is not a sixth sense, but it is the life of all the five. It is the open eye, the quick ear, the judging taste, the keen smell, and the lively touch; it is the interpreter of all riddles, the surmounter of all difficulties, the remover of all obstacles. It is useful in all places and at all times; it is useful in solitude, for it shows a man his way into the world; it is useful in society, for it shows him his way through the world. Talent is power, tact is skill; talent is weight, tact is momentum; talent knows what to do, tact knows how to do it; talent makes a man respectable, tact will make him respected; talent is wealth, tact is ready money. For all the practical purposes of life tact carries against talent ten to one.

LOSING A DAY.—Every day is a life, and our whole is but a day repeated; whence it is that old Jacob numbers his life by days, and Moses desires to be taught this point of holy arithmetic, to number not his years but his days. Those therefore that dare lose a day are dangerously prodigal; those that dare mispend it, desperate. We can best teach others by ourselves; let me tell your lordship how I would pass my days, whether common or sacred, that you—or whosoever others, overhearing me—may either appear my thriftiness or correct my errors; to whom is the account of my hours more due, or more known? All days are His who gave time a beginning and continuance; yet some He hath made ours, not to command, but to use.

WORK AND WISDOM.—How may the Christian teacher learn to adapt his instructions to those whom he is called upon to guide? Let him be instructed by the diligence and care of the husbandman. No wise farmer would think of sowing all his lands with the same kind of seed. Before he began his labors he would study the nature and capabilities of every field, to discover whether it were fit for pasture, for cereal crops, or for an orchard, and act according to the best of his judgment. Nor by doing this would he be disregarding the power of the Lord of providence. After all his care the same sunlight, rain and dew would need to descend upon every part to make it fruitful; and only by the blessing of Heaven could his work be crowned with success.

THE BEACON LIGHT.—To what shall we liken the warning given us by those who have made a wreck of life?

It is the beacon-light that burns above the pile of sunken rocks. No mariner is attracted by it to warm himself at its blaze; but as soon as he sees it he carefully steers away. Through the darkness of the night it sends forth a gleam like a lurid meteor, and it only shines because there is destruction around it.

MANY are miserable by loving hurtful things; but they are more miserable by having them. It is not what men enjoy, but the principle from whence it comes, that make men happy.

WHERE grace is improved to a considerable hight, it will work a soul to sit down satisfied with the naked enjoyment of God without other things.

THE mercy is the waiting man's, but the waiting man must give God leave to time his mercy for him.

PERSONAL ITEMS.

Victor Hugo is engaged on a poem entitled "La Pape."

Shakespeare's favorite flowers were the violet, pansy and cowslip.

The divorced wife of Brick Pomeroy, now an actress, has married again.

The Governor of California receives $9,000—the highest salary among Governors.

Victor Emanuel's moustaches were so long that he was never able to eat without fastening them up on each side of his face. Consequently he never ate in public, even at state dinners, though he sat through them all with great patience.

The Grand Duke Nicholas is described as tall, strongly built, and soldierly in person, but with no indication of capacity, and certainly none of refinement, in his countenance. His forehead is narrow, his glance fierce but without penetration; his features are altogether rather coarsely molded. He is filled with bluster. His Highness is one of the best linguists in the Russian empire.

Pope Leo XIII. has given orders to sell the elaborate carriages and large black horses which have long been maintained by the papal establishment They have been used by the employes of the Pope's Secretary of State for transportation to and from their homes, but his Holiness suggests street omnibuses. If these should not prove acceptable, he thinks the employes had better reside near the Vatican.

Divorce!

Upright legislator—"What sir! You take me for one that can be bribed? You insult my sense of honor—but in case *I really were such a man*. how much would you give me.

At the close of the sittings in the Illinois House of Representatives the clerk read the following: "I am requested to announce that the Rev. Dr. McFarland will deliver a lecture this evening in the hall on 'Education of Idiots.' Members of the Legislature are invited to attend."

"Larry, my wife and I have both noticed that the townspeople stare very hard. I hope you haven't been telling anybody that we are newly married?"—"Me tell 'em, sor? Is it likely I'd go agin my express orders? Why, whinever anybody thryed to pump me, sor, I tould 'em you wasn't married at all."

A physician in a country town, who had been annoyed by numerous questions concerning the condition of a patient, was stopped, while on his busy rounds, by a man with the old question: "How's M?" "Ill," replied the physician. "Does he keep his bed?" "Of course, he does, You don't suppose he's fool enough to sell his bed, because he's ill, do you?"

The Most Precious of Gifts.

Health is undeniably a more precious gift than riches, honor or power. Who would exchange it for these, the chief objects of human ambition? It is obviously the part of wisdom to employ means for the preservation of health and the prolongation of life which time and experience have proved to be reliable. Many of the dangers by which health is threatened may be nullified by the use of that most irresistible of correctives and tonics, Hostetter's Stomach Bitters, which, by increasing vital power and rendering the physical functions regular and active, keeps the system in good working order and protects it against disease. For constipation, dyspepsia, liver complaint, nervousness, kidney and rheumatic ailments, it is invaluable, and it affords a sure defense against malarial fevers, besides removing every trace of such disease from the system. Half a wineglassful taken before meals improves the appetite and insures complete digestion and assimilation.

Uncle Tommy.—D'ye think there's any chance of a war between England and Russia?

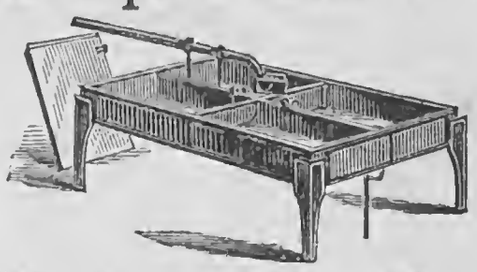
Squire.—Well, things look a little that way, Uncle Tommy. Why?

Uncle Tommy.—Well, Sir, I'll soon have to be selling my *pig*; and if they go to war bacon'll raise as sure as me name's Thomas.

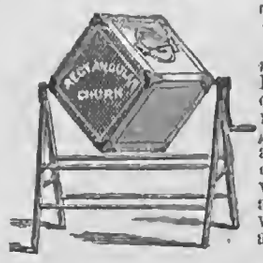
"GET THE BEST."
Highest Award at the Centennial!
THE IMPROVED BLANCHARD CHURN
PRICE GREATLY REDUCED

Perfect stock, best work, very efficient and durable. Nine sizes made, churning from one to 150 gallons. Warranted to be exactly as represented. Sold by all dealers in REALLY best-class Farm Tools. PORTER BLANCHARD'S SONS, CONCORD, N. H., Sole Manufacturers. Send for Circular.

Champion Milk Pan



The Best, Cheapest and most Economical Milk Pan in the Market. Saves the Butter Maker both time and money. Saves labor in handling the milk. Makes the best butter, and excels all others in durability and simplicity of construction. Illustrated Circular, giving full description of its working, sent free on application to WILLARD & HAMMOND, Randolph, Cattaraugus Co., N. Y.



The Rectangular Churn

Simple, efficient and *always reliable*. No inside fixtures. Fifty per cent. in labor saved over *any other churn*. 5 sizes made. The Highest award given over all competitors at the late Dairy Fair in Chicago. An energetic man wanted in every town, to act as agent. One churn sent at wholesale where we have no agent. CORNISH & CURTIS, Fort Atkinson, Wis.

KINGSFORD'S
OSWEGO CORN STARCH,
For Puddings, Blanc Mange, Cake, Etc.
PURE AND DELICATE—PREFERABLE to BERMUDA ARROW ROOT.

PRINGLE'S NEW HYBRID SPRING WHEATS.

CHAMPLAIN.—A bearded variety—a cross between the Black Sea and Golden Drop. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing, even in very ordinary culture, heads from 5 to 6 inches in length, containing from 60 to 75 kernels each.

DEFIANCE.—Another variety of spring wheat of the highest promise, the result of a series of experiments, to incorporate superior qualities upon the hardy stock of our common Club Wheat, by hybridizing it with one of the finest, whitest and most extensively grown sorts of the Pacific Coast.

This variety displays great productiveness, vigor and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 to the single head.

Price of each variety, $1 per lb.; 3 lbs., $2.50, by mail.

In order to induce Wheat Growers to give these new sorts a thorough and universal trial, we offer **$250 IN PREMIUMS** for the largest quantities grown from 1 lb. of seed, also for the 20 largest heads. For particulars see our Wheat Circular, mailed free to all applicants.

Rural Architecture.

PLAN OF A COTTAGE COMPLETE FOR $3,900.

L. F. GRAETHER.

THE following is a description of the plans of the cottage herewith represented: (For plans see page 248.)

Cellar and basement plan—A represents the hall; B, kitchen, (14 by 17.3) containing sink, wash-tubs, boiler and range, &c. C, pantry (4 by 5.5) with shelves and dumb-waiter; D, cellar steps; E, vegetable cellar; F, coal and wood cellar and heater.

First story—A, piazza; B, vestibule; C, hall, with main stairs; D, parlor, (15 by 18); E, sitting-room, (15 by 15 3) sliding doors between parlor and sitting-room; F, dining-room, (14 by 19.3); G, pantry, with dumb-waiter, wash-stand, etc.; H, green-house (12.10 by 19.3) connected directly by a door with the dining-room.

Second story—A, D, E and F are bed-rooms of the following dimensions respectively: 15 by 12, 15 by 11, 10 by 19 and 14 by 14; between A and D are closets, and one wash-stand; C is the hall with stairs to attic; B, wardrobe (4.6 by 6 2); G, bath-room, (4 11 by 10) with wash-stand, bath-tub and water-closet; H, entry to bath-room with tank; J, roofs.

The main dimensions of the building are shown on the plan; two additional bed-rooms can be arranged in the attic; a small winding staircase leads to the tower room.

The lowest estimate for this building (including heater, range, etc., all modern improvements) amounts to a trifle over $3,900. This is the cost at which it can be built in the immediate neighborhood of New York, where materials and labor are both dearer than in many other parts of the country; and in calculating the expense of this and of other structures, the plans of which are from time to time given in the RURAL, and the figures given must be scaled in accordance with local conditions in these respects.

Farm Topics.

THE BEST WAY TO MANAGE WEEDS.

PROFESSOR W. J. BEAL.

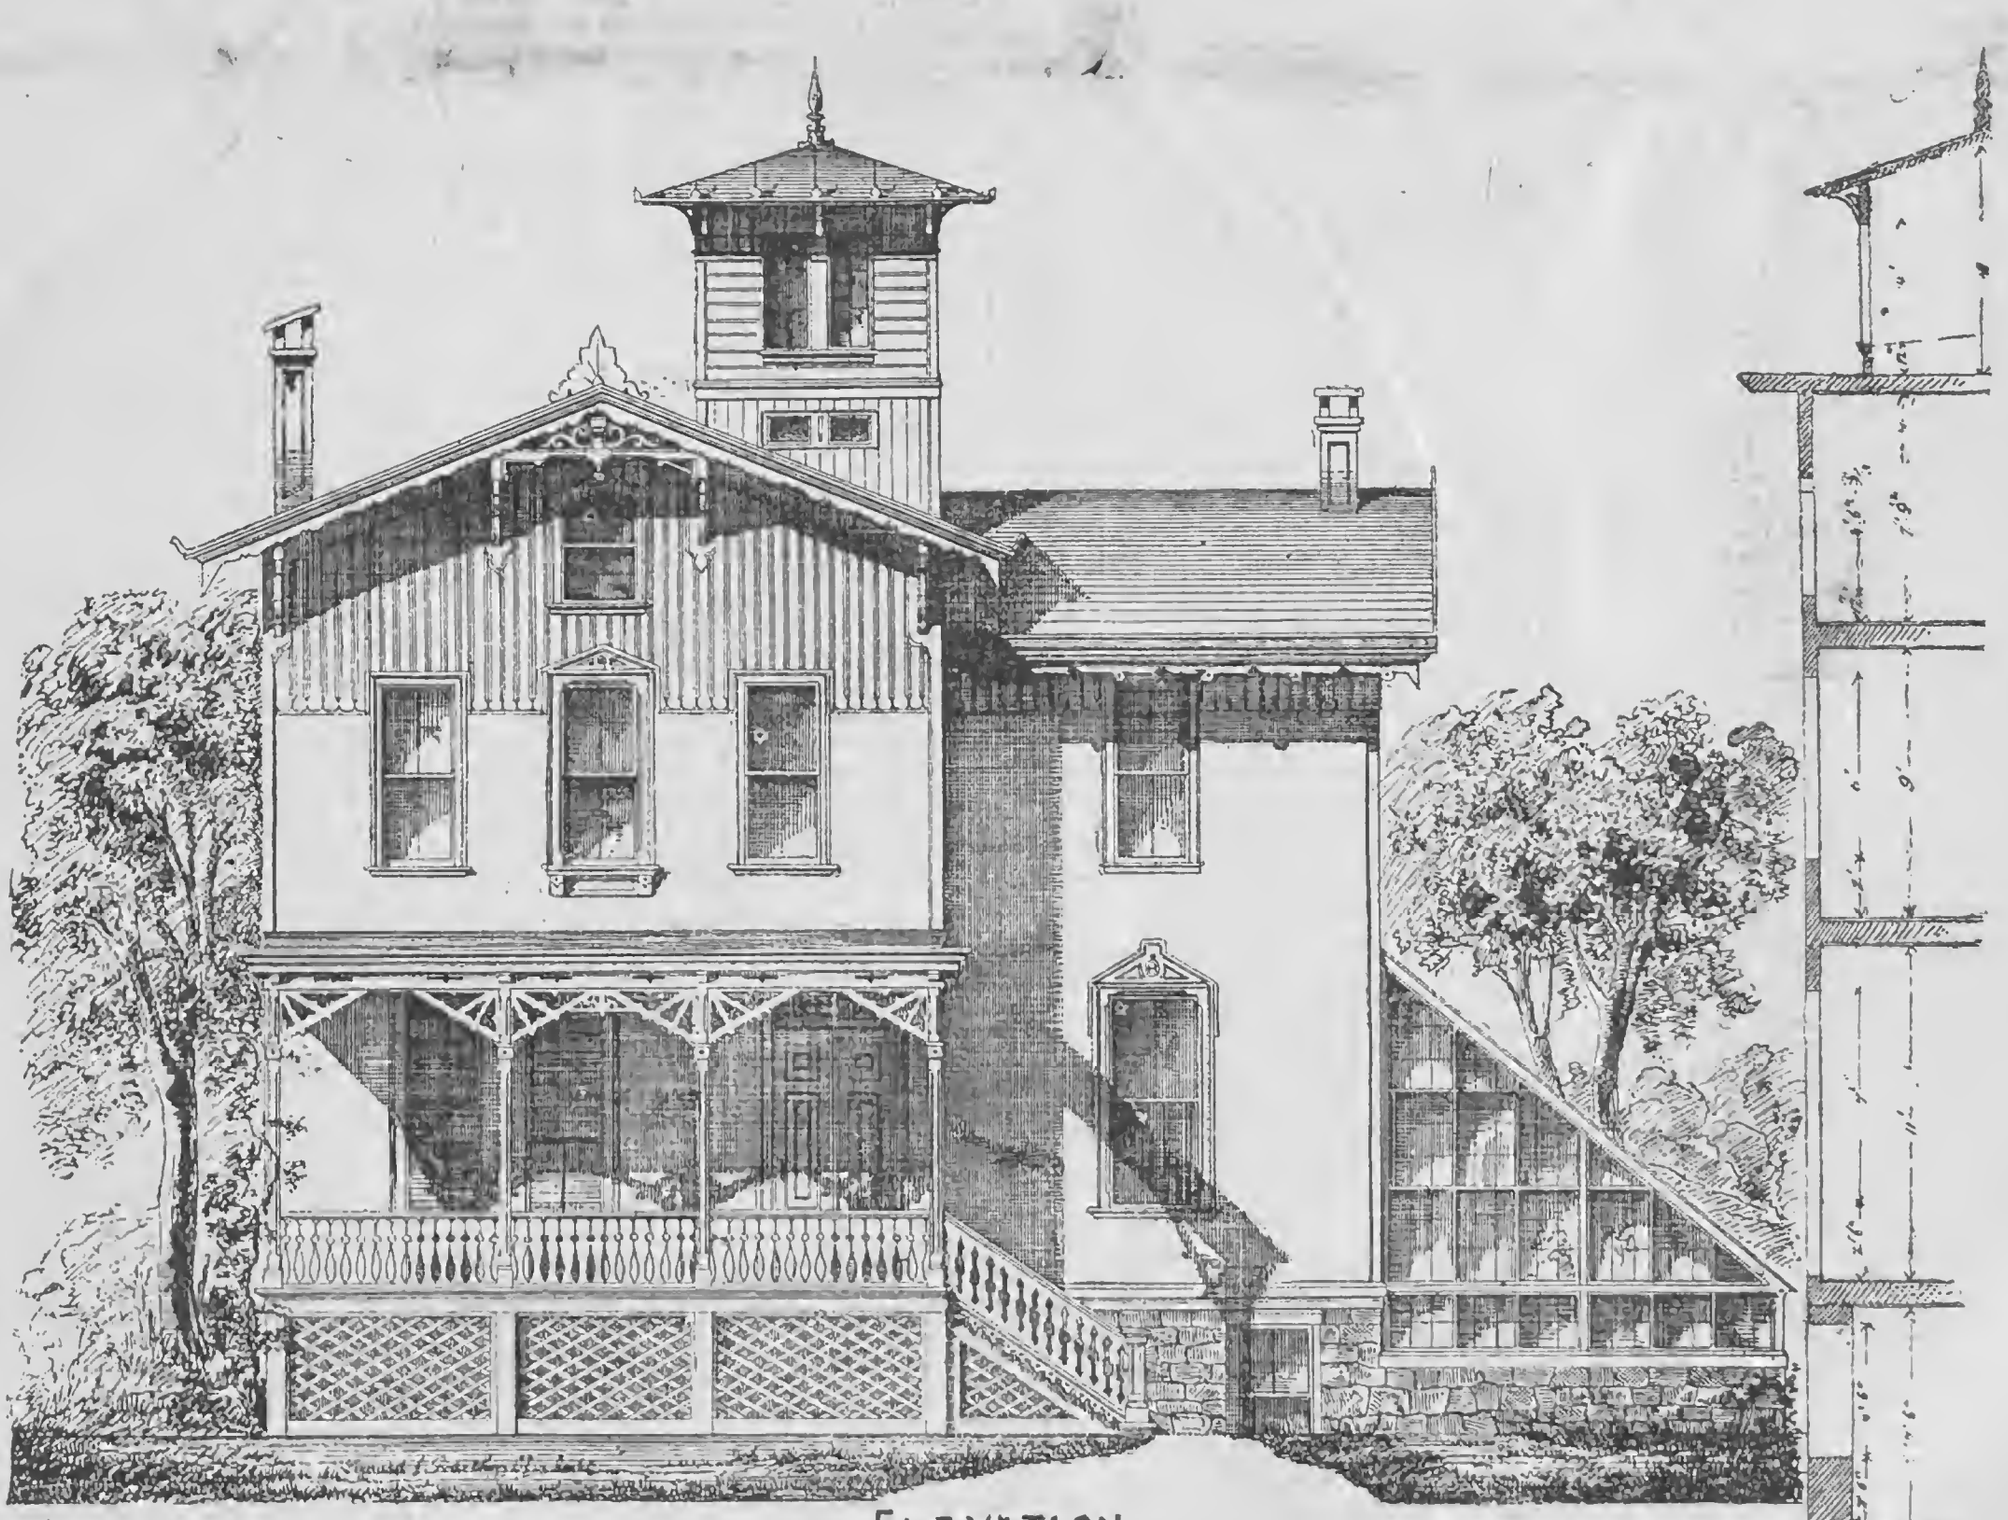
A PLANT may be classed as a weed in one country and not a weed in another. Purslane is not troublesome in England, nor chickweed in a dry, warm climate, but reverse the plants and each becomes troublesome.

Some writers define a weed as a plant growing out of place. Perhaps this is as good as any definition, but I like the one given by R. W. EMERSON the other day. He said: "A weed is a plant whose virtues have not yet been discovered." And he adds, "Every plant probably is yet to be of utility in the arts. There is not a plant in the whole magazine of material nature that cannot be made a power in the hands of thinking men." Certainly this is a hopeful view of the case, and a view quite in advance of the one generally now maintained by most farmers. Biennials and perennials are most troublesome in pastures and meadows while annuals are the worst for the garden and cultivated field.

A large majority of our most enterprising weeds come from Europe, Asia, or from the South. They have been brought in by mankind in the seeds selected for the field and the garden, in the fleeces of sheep and in a great variety of other ways.

Of weeds which may be called troublesome and which are never of any known value, we have perhaps eighty species, while twenty or thirty others are quite annoying.

It is quite a common opinion with many people that hoeing and cultivating are mainly carried on to kill the weeds which cover the ground. This is, or ought to be considered a mistake, even so far as the weeds are concerned. We should cultivate to prevent their growing—to destroy them before they get out of the



ELEVATION.

COMPLETE COTTAGE FOR $3,900.

ground or while they are yet too small to attract attention. Many times the farmer begins in the spring with good courage and determination to keep the weeds down. This he succeeds in doing for a time while the weeds are small and few and grow slowly, and the land is soft and easily worked, but haying and harvesting and other work or sickness crowd upon him and before he knows it, the weeds have got the start of him. The increasing heat of summer brings on a reinforcement of weeds. The ground becomes harder, and the surface matted over. The farmer rallies again to his work of extermination; but many of the weeds have, to a great extent, accomplished the object for which they grew. They have riponed seeds which will fill the ground for other plants in future years. These weeds are usually left on the ground to decay and drop their seeds. Let any one examine carefully a pig-weed or an amaranth, and no doubt he will be surprised at the immense number of little black or brown seeds concealed along the stem where he supposed there were no signs of seeds, nor even yet of blossoms which precede the seeds. By estimate, a good-sized plant of purslane produces a million and a quarter of seeds. In this way the soil soon becomes filled with them.

A few years ago, I took in hand a garden which had been very weedy for several years previous. I cultivated well and often, and for three years took great pains to remove all weeds which had been overlooked or missed by the cultivator. In hot weather and late in the season we went over the ground each time before the land was cultivated and picked up any weeds containing seeds. These were carried off the garden and kept out of the pig-pen and compost heap. Another point was rigidly adhered to where many fail. The soil was cultivated often till late in autumn, as long as there was any chance for the weeds to grow. In this way, we kept the seed from the ground, and kept stirring the soil to encourage all the seeds to germinate. Near the close of the third year, we found that boys needed no baskets to carry weeds from the garden, as they could carry in one hand all they found in three rows of onions, twenty-five rods long.

Considering the abundance of foul stuff in the manure purchased, and the ease of keeping down annual weeds by frequent cultivation, I doubt whether it is profitable to be so nice in taking out every weed and in removing it from the ground.

Somewhere I have read, that JOSEPH HARRIS of Rochester, said three-fourths of the farmers of New York lose one-half of their profits annually by weeds, equaling $50,000,000. He added, "It is easier to hoe four times where there are very few or no weeds, than to hoe once where the soil is weedy."

J. J. THOMAS is ever making apt contrasts between the best way and the poorest way of doing things. By his watch, a bed of flowers containing eighty square feet is raked once a week in four minutes, for each raking, and for May, June and July, forty-eight minutes. In another bed of equal size it required over an hour to clear all out by hoe and hand. This must be repeated every three weeks for three or four months, and even then the plants will not do nearly so well as by frequent raking over.

By the watch and actual testing, it takes only *one-fifth of the time* to rake every few days that it does to weed once in two or three or four weeks during the entire season. By carefully watching the work, I am confident that the above statement is near the truth. No stronger argument, then, can be drawn for frequent cultivation. It is much the *easiest* way as well as the *best*. It is often hard to make the boys fully understand this. If no weeds are prominent, they will not always go over all the ground well but skip now and then a patch which very soon tells of slighted work. The practice of cultivating every three to six days is common with many of our best gardeners, but it is not the practice in all gardens, especially in the gardens of farmers. It is hard to tell how much this old truth would be worth to our farmers if they would only act accordingly.

Weeding gardens once in two to four weeks is up-hill work, especially if done by hand when it takes during the season five times as long as it would to cultivate every few days. Then, destroy the weeds just as they are germinating in the soil. Let us all try by example and precept to do work in the easiest as well as in the most economical manner. We hope every reader whether satisfied or not satisfied with the evidence given, will try some experiments on this subject the coming season.

In closing I must tell how I have several times killed patches of quack-grass. It was not by digging it all out root and branch. I failed when I attempted that mode. There is no secret about it. I kept the land cultivated every three or four days (never more than that) when I killed the grass quickest. The leaves were not allowed to show themselves. I gave it no peace in its bed, but kept it turning over and over. A small piece growing on black, rich soil rather inclined to be moist, was plowed very late one autumn. It was cultivated as above mentioned till time to sow rutabagas, when no quack-grass was to be found. None has since appeared.

Agricultural College, Lansing, Mich.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE have been looking at the different kinds of feed to see which was the cheapest. Wheat bran without a particle of flour in it, costs $18 a ton; buckwheat bran at least half of it flour, we can buy for $16 a ton; oil-cake meal $2.25 per hundred; corn meal $25 a ton; and oats 30 cents for 32 pounds. Barley is the best feed for a sow with a litter of pigs. It is healthy and will make more milk than any other grain. As soon as the barley meal is gone we shall give the sows oats, as this grain is next to barley as a good grain for animals suckling. The lambs are growing finely, showing that the quart of oats each one gets daily is making milk. A ton of oat-meal will cost $20 as we must add one-tenth to the price of the grain, $18.75, to pay the miller. This with an allowance for waste will make $2. We save this by feeding the grain whole to the hogs and the young pigs will thrive nicely on the oats. Most farmers would say "Buy corn-meal at $25 a ton and feed that." Corn meal is well enough in its place when you want to fatten an animal; but when you want bone, muscle, and tissue, you require kinds of food which will produce them: corn meal is not the feed for young animals. Wheat bran being so high and so poor, we are giving the young calves buckwheat bran and oil meal, twice the quantity of the former to one of the latter. As soon as we get some oats ground we shall add one quart of oat-meal. A peck of buckwheat bran is fed to each cow daily and they are doing well. The old hair is coming off, and the milk makes fine butter. On the whole, the buckwheat bran is the cheapest. The big colt has got fat on his four quarts a day, and his coat shines, showing that his stomach and bowels are in good order and that he has got rid of the worms. Good wheat bran with one-third of its weight flour, is excellent feed for young animals. It should be scalded for pigs, and be mixed with a little oil-meal for calves. We have wintered two calves, born at the beginning of December, on this feed, with part of the milk of one cow divided between them. They look so well that we are proud of them.

The barley ground is dry enough to sow, but this grain should never be put in until the ground is warm and it is fine growing weather. Barley, unlike oats, is tropical in its nature, and does best when the temperature is well up—hence, it should be sowed late. The land must be mellow for barley, and a sprinkle of manure on the surface harrowed in with the seed, will greatly improve the crop. It is very useful grain on the farm and barley cakes made from the flour are nutritious and very palatable. Two bushels and a half of seed will sow an acre. Last year we raised a crop at the rate of forty bushels an acre. The straw cured good is excellent fodder. It should be cut as soon as the berry is out of the milk. It grows quickly and may be harvested early enough to raise a crop of turnips on the same land. It is an excellent crop to seed with, being next to wheat and rye in this respect. It is not exhausting to the land for other crops, but will exhaust the soil for producing its own kind. This was proven so effectually years ago in all this section of the country that its culture had to be abandoned, and no barley of any account was raised for twenty-five years. After this long rest the same fields now produce well. The two-rowed is the favorite sort grown.

Berkshire hogs are not so liable to get mange, which is caused in all animals by an insect burrowing under the skin, but they are more liable to get *lousy* than white ones. We saw a stock boar, awhile ago, alive with lice, big fellows like sheep ticks. We recommended that he be washed with brine; no use, they were as lively as ever afterwards—next soft-soap—and this finished them. After three or four days the hog was rubbed over with grease. We once saw, at a fair of the N. Y. State Agricultural Society, the Berkshires of a noted breeder very lousy. We never saw one on a white hog.

Like the rest of mankind, we are inclined to do as "father did." Fathers were sometimes mistaken, and never more so than when they told us that "a lamb must have but a very little milk." Following this advice we have been starving lambs: we have been obliged to raise by hand all our lives, and they did too. No wonder under this rule two-thirds of the poor little creatures died. It grieves us, and always will, that we were so blind and blindly cruel. A lamb we were trying to feed died the other day. It got weak and one morning its jaws were set and it would not swallow. We knew it had not been sick; what made it die? As this important query went through our mind, we happened to look at another lamb born at the same time—a big fat rollicking fellow so full of life that he could not keep still, but had to skip and play, while one lamb was stiff and cold in death and had not grown a bit. What made the difference? Milk. This big fat lamb, judging by the size of the ewe's bag, had at least two quarts of milk and maybe three every twenty-four hours, while the dying one had never been given a pint. A few days afterwards we had three lambs to raise by hand, and, our fathers to the contrary, they were allowed to suck through a rubber nipple all the Jersey milk they wanted. These lambs grow and are a convincing argument that instinct is a better guide than old notions, at least for lambs. Another thing, a lamb from a large breed requires a great deal more milk than from a small one: so of any animal, we must feed according to the size.

Farm Economy.

GETTING OUT MANURE.

W. J. FOWLER.

EVERY spring and fall much time and team-labor are wasted in badly contrived methods for drawing out manure. The most common sight is a man with team and wagon, which last is loaded, drawn out and unloaded by the same person. It is slow work at the best. Fully half of the time the team is idle while the wagon is being loaded, and this too when team work is worth at least two dollars per day. But this is not the only or chief loss. Not one half of the farmers in this section clean their barn-yards so thoroughly as they should. The loss of the use of manure from spring until fall or even from fall until spring is twice what it should cost to get every load on the growing crops. Manure left in the barn-yard through the summer is usually more than half wasted by fall from evaporation or washing by rains. What shall we say then of the practice of some of leaving manure from year to year from inability to get it on the land? Talk about the necessity for buying commercial fertilizers! I believe in this, but it is a fact that fully one-half the farmers don't use what manure they have, to say nothing of at least two-thirds of the remainder who do not feed so much stock and don't therefore make so much manure as they should.

It is possible to make land poorer by purchasing commercial fertilizers and removing all the crop without making any other return. A light dressing, one or two hundred pounds of guano or superphosphate, will sometimes nearly double the crop of wheat or other grain. The small quantity of concentrated manure in close contact with the seed enables the plant root to extend rapidly and draw a larger amount from the soil than would otherwise be possible. Now if none of this crop is returned to the soil as manure, it must result in an absolute decrease of fertility. But there need be no fear of this if the farmer makes, saves and uses all the manure that he can. In such case larger crops, however obtained, mean an increase of the productive capacity of the soil. It is not possible to grow a crop without either making the soil richer after the crop is taken off or giving the farmer the means of making it so. Hence there need be no hesitancy in using all the fertilizers that can be procured, first from the farm itself, and afterwards by the purchase of such commercial fertilizers, gypsum, phosphate or guano as experience has proved to produce good results.

GOOD TOOLS.

"GOOD tools are half the battle in farming," some one has said, and I am inclined to think there is more truth than poetry in it; I know it is a great deal easier to work with good tools than with poor ones. I have tried both and am decidedly in favor of the former. Good tools are far cheaper in the end than poor ones. It is true poor ones usually cost less to begin with, but the purchaser cannot do so much work with them as with good ones, and then again, there are many more repairs to be made on them, so that in the end they are the most expensive. For instance, a farmer wants a wagon; his neighbor has two which he must sell, therefore he offers them cheap. One is nearly as good as new, while the other has been run many years and is weak in many parts. He doesn't know which to buy, but finally concludes to take the old one, as it is a few dollars cheaper and he thinks it will do for his business as well as the other. So he takes it home and goes to work. It does very well for a few days, but finally he gets on too heavy a load, drives over a little stone, and whoa! his wagon has broken down. Now he is in a sad fix; his team must lie still a day or two, his work must be neglected (perhaps it is planting time, or he has a lot of hay out) and he must go off right in the rush of work and get his wagon repaired, costing him more than it would to have got the best one which his neighbor offered him. Now, wouldn't he have been better off if he had got a good wagon in the first place? So it is in regard to plows, mowing-machines, horse-rakes, and indeed all other tools which a farmer uses. It is my opinion, and that of many other farmers that "the best is the cheapest." Therefore, when you want any tools, first find where you can "get the best," and then buy them.

F. H. D.

Field Crops.

ARTICHOKES AGAIN.

IN a note I sent the RURAL, printed in issue March, 30 I said: "There is nothing easier to eradicate than artichokes if you try the right way," and added. "Keep the tops of any plant out in and the plants must die."

The RURAL takes exceptions to this and says: "Killing plants by cutting off the tops is a pleasant sort of theory * * but there are hundreds of plants that are not appreciably harmed thereby."

Now, one of us is evidently wrong unless we do not understand alike what cutting off the tops means. I well know that pinching in, pruning, or in any way removing a part of the top of a plant often strengthens it, and this is not what I meant at all. I divide the plant into top and root and still insist the root cannot live without a top. Not even a Canada thistle. It or any other plant will undoubtedly endeavor to form a new top from the stub, but let the decapitation of these be attended to, and I am confident the desired result will be obtained. If the RURAL will name one or more of the "hundreds of plants that are not appreciably harmed thereby," I shall be glad to give them a trial. But so far as the artichokes are concerned I can give you instances where they have been destroyed unintentionally by cutting the tops for fodder. Consequently I cannot agree with you that "artichokes are troublesome to get rid of."

L. A. R.

REMARKS.—We did and do admit the efficacy of the rule. But there are exceptions and in many instances the destruction of weeds in this way is impracticable. Just the same as it is impracticable to exterminate Thistles, Dandelions, Plantains etc., by applying oil of vitriol to every one.

The antichoke forms many tubers a considerable distance from the stem, say three feet. From these, scores of plants will appear the next year and hundreds the next. Hence we say "when established," the antichoke is "hard to get rid of." Now, if anybody knew just the time that the tubers had exhausted themselves and before new ones were formed and were to cut off every leaf close to the root at that time, probably the crop would receive a death-blow. But we submit that the method involves some "trouble."

As to naming "one or more" of the hundreds of plants that are not appreciably harmed by decapitation; Crab Grass (Panicum sanguinale) Bermuda and many other grasses the stems of which will root at every joint; Purslane (Portulaca oleracea); Docks, such as Rumex crispus, R. obtusifolius, R. acetocella; Asparagus; Clerodendrum fœtidum. It seems moderately plain that *any* plant if persistently deprived of every leaf as soon as it appears, must die. Plants derive nearly all of their sustenance from the air and it is not to be supposed that a root buried in the ground can survive beyond the time when its store of nutriment is exhausted in vain attempts to develop buds and leaves. But there *are* hundreds of plants whose stems seem for periods to take the place of leaves and whose roots will, if cut into small bits, push buds as readily as seeds germinate.—[EDS.

PRICKLY COMFREY.

I KEEP a few cows, and have for years sowed sweet corn in drills for fodder—when pasture begins to grow short. Last spring I bought some of the Prickly Comfrey. The pieces of roots were so small I put them in moist dirt, kept them where it was warm, and when they had made a few leaves, set them three feet apart, placing the piece of root about two inches below the surface. The ground was rich. I cut the comfrey three times in the course of the season. Judging from one hill the product of which I weighed at each cutting, the yield per acre would be over thirty-three tons. My cows with one exception ate it readily, and a Jersey bull which I had to keep confined, ate it in preference to the corn fodder. I have been taking up roots to increase it, and find some are very badly eaten below the crown, and the roots be-

low rotten. It must have been done late in the fall. I would recommend to any one who is going to grow it, to get the pieces of roots growing (if they are small), before putting it out, and to make the land rich. D. M. C. BETTIS.

Tolland Co., Conn.

PEARL MILLET.

MR. WM. H. CARSON, 125 Chambers St., N. Y., is making a speciality of this. Among a great number of testimonials which he has received during several weeks past, we selected the following as conveying a fair idea of all:

KINGSBURG, Fresno Co., Cal., March 16.

"I entirely agree with you as to its great value. 'Tis very common here." A. S.

MILLTOWN, Berrien Co., Ga.

"If your Millet is the Millet we raise here, (and I think it is) there would be no particular trouble for us to raise or grow for seed. It is a slow seeder even with our long seasons, but we can cut it five or six times and then let it head for seed." T. E.

TALLAHASSEE, Fla.

"I have been planting it for several years both as forage for stock of all kinds, even hogs—and as grain for chickens for which it answers an admirable purpose and I consider it the most valuable crop for most purposes I have ever raised." R. N.

We have prepared to test this Millet in our own grounds and we have some confidence that the result may prove in harmony with the many good things that have been said of this plant.

Entomological.

APPLE TREE BORER.

AN article in the RURAL for March 23d, entitled "To kill the larvæ of the apple-tree borer," has attracted my attention. It, I think, greatly magnifies the difficulty of destroying the "worm." Let me hazard an opinion in regard to the arrangement therein described for killing the pest. It is not practical to any extent. It would be of no use unless the nozzle were inserted directly into the chamber he has excavated for himself and where he is; for the idea of ever forcing any liquid through the mass of *debris* he leaves behind him, would in nine cases out of ten utterly fail; for it would escape through the orifices in the bark, which he makes to dispose of the surplus *debris*, when it is in his way. Enough for that.

I have dug out thousands of these pests, having had a large experience among orchards not my own and also among nursery trees. I never found a hole where one had entered closed by the growth of the tree. Having removed the soil around the base of the tree to expose the presence of the "worm," on clearing the bark by scraping it with the back of a knife, his presence is indicated by a little spot, and the extrusion of a greater or less amount of chips. If he is a *juvenile*, hatched the current year; or only one year old, he will be found near and a little below the orifice and is easily destroyed; as he has cut but a small place beneath the bark and has not as yet hurt the tree at all. If two years old, he will be found further down the root, having cut a somewhat tortuous and continually widening path and packed it hard with *debris*, involving more and more the woody structure. This downward path is generally about four inches long, very seldom six. He then turns and cuts his way up, generally keeping near the other path and passes the place of entrance, whereupon he commences to cut deeper, making a path in the sound wood and keeping entirely away from the bark. He continues his path upwards to about a foot above the place of entrance, cuts to near the surface, retires to the excavation he has made and goes through his last change, getting his wings ready for an active out-door life.

I think the injury to the tree is principally done the first two years, while he is cutting between the bark and wood. If there is a hole through the bark in the body of the tree above the place of entrance, it is too late to look for him. He is gone—but if there is no hole, he has not yet got away. In that case cut down after him, remove the dead bark and *debris*, and follow his path until you find an open chamber, and then it is not generally difficult to dislodge or destroy him with a fine wire. An acquaintance of mine takes a small bit, and after finding his bearing, bores in and follows him up that way. It is a benefit to the tree to clear the path made of *debris* and dead material. I have noticed that as long as the dead matter remains, no young wood is formed at the edges; and the healing process does not go on; but as soon as the dead matter is removed and the edges cut fresh and smooth, a new deposit of wood is made and the scar commences to heal up, and if the wound is not too great, it heals over. I have found some trees with so many old fellows that they were entirely girdled and could not be saved.

The method of prevention mentioned in the article referred to, is good; but not infallible—perhaps no method is infallible. The nearest to that, is to wrap the bottom of the tree, from an inch or two under to a foot over ground, with cloth or paper, from the first of May till the middle of September, when it should be removed, to enable the bark to harden that it may not be injured by the freezing of winter. Another method of preventing mischief is to bank the trees with earth, four or five inches high, in the early part of the season; and remove it in the fall and cut out any borers that may be present, before they have done any harm. Whatever preventive may be employed, the trees should be carefully examined once or twice a year.

Have any of your readers observed that buckwheat sown in an orchard will keep away borers? I have lately come to take charge of a large orchard, and find on examining the trees, that in a part of it where buckwheat was raised last year, there were none of the young larvæ. Was the buckwheat the cause?

OBSERVING INSECTS.

B. PICKMAN MANN.

LIKE other sayings which are sensible and true, the valuable words of Mr. GARFIELD, on page 74-75 of the present volume of the RURAL NEW-YORKER, can be applied to other subjects than those for which they were written. I wish to apply them to my subject. The time of year is upon us when insects are coming forth from their winter rest to begin active life once more. The insects which work for us, the insects which work against us, and the insects that concern us only on grounds higher than gain or loss of property are coming forth together. Who knows what they may be, or where they may appear, or what they may do? Who will tell us, after they have come, what they have been, or where they have appeared, and what they have done? "Our people want facts that are the result of careful observation and experiment," as Mr. GARFIELD says. Perhaps few of the people can command the time or the means to experiment usefully, but all can observe, and observation is the basis upon which all our knowledge rests.

Let, then, all who have the time and inclination, collect and observe the insects as they come forth. Let them also observe the birds and the beasts and the flowers, if they can and will; the more the better. Do not wait till the season is over before you try to tell what you have seen, or you will forget a part and perhaps get the rest mixed. Keep a note book and put down every day what you see, or, if you do not put it down that day, then when you put it down say you made the observation "yesterday," or "a week ago," for in this way you guard against the danger of giving the same authority to long-remembered observations as to those that are fresh in your mind. Make collections at the same time that you make observations. The most skilled entomologist sometimes mistakes in naming things he has only seen and has not had in his hand, or does even worse than that. Sometimes entomologists carry their collections from one museum to another in this country or even to museums in Europe, to make sure that they have given the right names to their specimens. How much more necessary is it then, for unskilled observers to back up their statements, by showing the specimens they have observed! If Mr. JOHN SMITH sends me a beetle which has been eating his potato-vines, and tells me what he has observed about its habits, it does not matter to me whether he calls it a beetle or a bug or a weevil or a fly, because I can find out what it really is, but if he tells me what he noticed and does not send me the insect, I cannot tell which of the hundred thousand beetles or twenty thousand bugs or weevils or flies it is, unless I knew beforehand all that he tells me, and then his story has no news in it.

If he wants to follow up his observations, let him mark the specimen No. 1 or No. 2, or whatever else he pleases, and write in his note-book what he observes about it; then he can get a name for it sometime.

Middlesex Co., Mass.

The Garden.

DOES THE VEGETABLE GARDEN PAY?

PROFESSOR A. W. MANGUM.

THERE are two classes who say that it does not. One class resides in town and the other in the country. The town skeptic says "Labor is so high and there are so many little expenses involved, that I regard it cheaper to buy my vegetables than to raise them; and therefore I will not cultivate them."

This may be true of a few kinds of garden products, at least in the first preparations; but it is far from true in the average. Of course, I speak of those who have the ground that they may devote to the purpose considered. A simple calculation of the cost of seed and labor, on the one hand, and of the value of the average yield, on the other, will show that my position is correct.

In addition to this economical view, there are many advantages in having a garden. If one raises his own vegetables the earliest are as cheap as any other, or nearly so; whereas he who purchases must pay fancy prices for the first of any sort that appears in market. Generally, the earlier one can obtain any desirable vegetable the more it is enjoyed. From one's own garden vegetables may be gathered and used while they are still fresh—uninjured by transportation. How often are housekeepers compelled to buy stale and unwholesome market supplies, simply because they must have some and can get no others? It is a great privilege to be able to get the articles desired just at the time they are needed. It is also true that the family that has a good garden of its own, will use much more vegetable diet than it would if compelled to purchase every such article from another. Again, one has a preference for certain vegetables, and knows the peculiar taste of his household; thus being able to raise just what is most desired. But I emphasize the luxury of the garden in another sense. Town folk need the extract of the fresh green country which is furnished by garden and lawn. They need the exhilarating exercise of work in the garden. They need the recreation that is secured by taking interest in the growth of what they plant, watching its changes and enjoying its promise, and, at last, going every day or two to gather where they have sown and toiled. More interest in gardens would give more tone to the nerves and more vivacity to the spirits.

The country skeptic says:—"I haven't time to fool with the garden; for I must attend to my crop." He will roughly plant one kind of potatoes, a quantity of late cabbage and some corn-field beans. Through spring and summer he will scarcely realize a change in diet for self or family, until the *late* corn is large enough to use and the late beans and potatoes are ready for the table. Possibly he may have had some turnip salad in early spring. He has been making cotton at a cost of about ten cents a pound, to sell at the same rate. Perhaps he is most busy about corn or wheat that costs him not much less than the market price. His table has had none of those appetizers, none of those natural anti-febrile acids, none of these cooling gifts of the garden, which impart to the wiser so much of pleasure, comfort and health. He might as reasonably wear his winter clothing all summer, as to eat his winter diet all summer. His privation would be more excusable, if it were not at the actual reduction of profit.

Chapel Hill, N. C.

SALSIFY.

WE have endeavored by several notes this season to call the attention of farmers to the value of this toothsome and healthful vegetable. The seeds may be sown as late as the middle of May, and as we have said, the esculent roots left

in the ground until next year to be used as wanted or taken up late in fall and stored in the pit or cellar. Sow seeds in drills a foot a-part and thin out to six inches in the row. For the many different methods of cooking Salsify, see Domestic Economy Department, back numbers. The accompanying cut shows the plant and an easy way of doing it up in convenient bundles for the market.

Pomological.

PLUM CULTURE IN OHIO.

M. B. BATEHAM.

I FIND by letters addressed to me, that much interest is felt by fruit-growers and nurserymen in regard to the success of the extensive plum orchards that are known to have been planted in this State, and also as to whether such planting is still going on.

In reply I would only say that of the 150,000 plum trees which I estimate are set in orchards in Ohio, probably not over one-fourth are as yet of bearing age, and of these the greater part are of Damson and Wild Goose or other native varieties, and located in the southern parts of the State. For two or three years past the crops have been mostly failures excepting of Damsons. These have borne fair crops in most localities, and the older orchards have been quite profitable, though not quite as reliable as was formerly supposed—owing to frequent injury by spring frosts. A good deal of planting of these is still going on, but I do not think that any more trees of all kinds were set the past year than were killed of the larger varieties by the previous winter. The Shropshire Damson is the kind preferred, and the trees are grown on peach roots, budded close to the ground, so that when transplanted the juncture is set a little below the surface; then no injury is done by grubs, and in many cases plum roots are formed above those of the peach. Bearing orchards of such trees are so thrifty and productive as to lead planters to prefer them to those on plum roots; but it is thought that none of the larger Plums do well on the Peach—especially as the kind of soil preferred for plum orchards is more clayey than is congenial to the Peach. It is found that the curculio is less injurious on clayey than on sandy lands. The Damson crops, however, are not commonly much affected by this insect; partly because the fruit usually sets so full that it needs thinning by this or other means. It may be that as the orchards become older the insects will increase in them so as to render it necessary to combat them as is done in the finer plum orchards.

The Wild Goose Plum has been quite largely planted in two or three counties around Cincinnati, but contrary to my advice. Several orchards here fruit five or six years ago, but have failed each year since, owing to the early blooming of the variety, and its consequent liability to injury by spring frosts—hence, no further planting of it is likely to be done, and the orchards will probably be top-grafted or cut away.

Of the finer Plums—Lombards, Prunes, etc.—there are perhaps 50,000 trees in different parts of the State, mostly north of the center. A few thousand of these bore one or two fine crops about five years ago, and some of them were damaged by overbearing. Since then only partial crops have been realized, and some thousands of younger trees have since been killed by severe winters; hence the amount of planting has not been great for a year or two, though I hear of a considerable amount being done this spring; and complaint is made that trees of the kinds desired cannot be found in sufficient numbers at the nurseries.

WINTER KILLING.

I visited the past fall the noted plum orchards of the Messrs. BROWN, in Huron county. They have planted about 7,000 trees, but the greater part of their youngest orchard, two years planted, was killed to the ground by the previous winter—as were several hundred trees of older growth. They have also lost many trees from the same cause in previous years. This winter-killing is not so much in consequence of the severe cold, as the condition of the trees when winter sets in. The mischief is evidently a result of the shedding of the leaves during hot and dry weather in the latter part of summer, followed by the starting of the terminal buds and a fresh flow of sap on account of moist and warm weather early in autumn, leaving the wood sappy during the winter. Frequently it will occur that tufts of new leaves put out at the tips of the young shoots, which continue green until killed by severe frosts in November. Some varieties, I was told, are more liable to this trouble than others; but I could not discover much difference.

The remedy, I think, must be found in the choice of soil, or its preparation for planting—to secure such depth as will induce the roots to go deep enough to resist the effects of drought. Or, what amounts to the same thing, have the soil worked so deeply that it will absorb and hold moisture sufficient to withstand drought; then the leaves will not fall prematurely.

Mulching is another means of contributing to the same end, and will be found immensely beneficial both to plum and pear trees. Apply the mulch any time after the spring rains and surface cultivation, covering the whole ground with

refuse straw, corn stalks, marsh hay or other litter. This can be raked up and stacked in the fall, for a second season, if desired, or left to rot on the ground.

At the plum orchard of 3,000 trees planted by Mr. SHANKLAND, about twenty miles further west, no considerable loss has been sustained by winter-killing. The soil in both cases is a clayey loam, but the latter has more depth than the other, with a less compact sub-soil, rendering it less subject to injury from drought.

BURSTING OF THE BARK

is another cause of very serious damage to plum trees in the BROWN orchards. This is occasioned by the freezing and expansion of the sap, so as to cause the bark of the tree to burst, or to separate from the wood so as to die—usually on the southwest side of the trunk, where most warmed by the sun. This, I have no doubt, can be measurably prevented by the means already mentioned; but in addition I would screen the bark from the sun, on the south and west sides during winter, by means of a couple of strips of thin board, or half-sections of bark peeled from sapling forest trees in June, or even with strips of hard-ware paper fastened with tacks or twine.

AS TO THE CURCULIO,

I have repeatedly stated that this is no hindrance at all to the success of commercial plum culture, but rather an advantage; as the ravages of the insects are sure to prevent people from growing Plums in a small way; for nobody can afford to attend to jarring and catching the beetles every day for a month from half-a-dozen trees, but for a thousand or two the crop is of sufficient value to pay well for having a man, with the proper apparatus, to give the matter regular attention. The labor in such a case is found to be quite small in comparison with the results.

Painesville, O.

Miscellaneous

PUMPKIN SEEDS ONCE MORE.

YOUR correspondent, "Hector Bertram," inquires first, whether I ever kept *geese*; and if so, whether they were allowed to eat pumpkin seeds; and, if so, with what results. I reply that geese were kept on the farm for many years, or at least till a sufficient number of feather-beds were procured to supply a large family—for the days of antipathy to feather-beds had not yet arrived. The geese had the range of the barn-yards and their vicinity, and in the season when pumpkins were fed to cows, were, with perfect impunity, permitted to help themselves to all the seeds they desired, without any injurious results whatever, as far as was ever noticed. I will not venture to assert that they considered these seeds to be such a "great luxury" as your correspondent concludes I did, but our geese were not such *silly geese* that they were ever known to gorge themselves with food that nature never intended that they should eat. That acquired or intuitive knowledge of what is suitable for them for food, with which the God of Nature seems to have endowed all the different species of dumb animals, appeared not to have been withheld even from our geese.

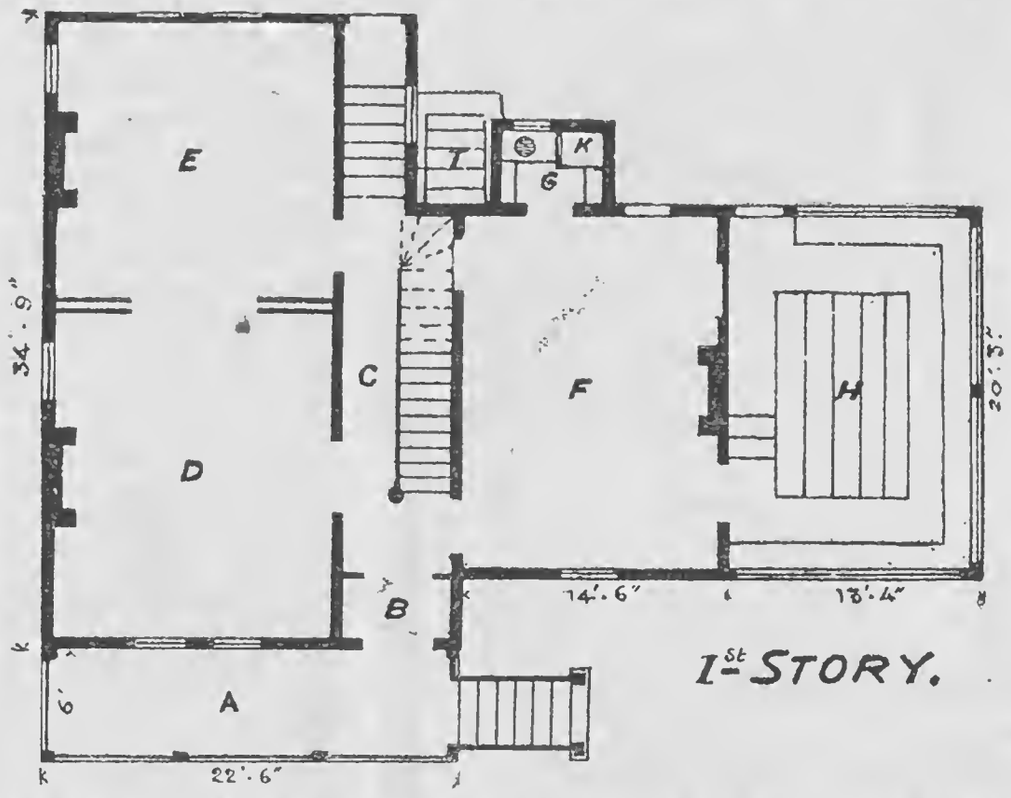
To his second inquiry, whether I ever tried the experiment of feeding a portion of the cows with pumpkins, and another with carrots, beets or corn stalks, I answer in the negative. The rule has ever been, when the pastures become scant, in the latter part of the season, to supplement them, first with green sowed corn, then with pumpkins while they lasted, and then with the root crops which would keep later. Even unmarketable apples are more valuable for such use than to be made into cider. At least *I* so consider them.

As regards pumkins, your correspondent closes by saying, "They are excellent for fattening purposes, but diminish rather than increase the flow of milk." My own experience has induced me to believe directly the opposite, but probably it would require more space than could be afforded in the RURAL for either of us to convert the other to his own opinion. Therefore *I* will not attempt it. It has not been my intention to "ridicule the ideas" of any one on the subject, as your correspondent supposes. My purpose has been, merely, to "speak that we do know, and testify that we have seen." Others have the same privilege. Having an opinion of my own, I trust that at the same time I am not willfully blind or bigoted. CLINTON.

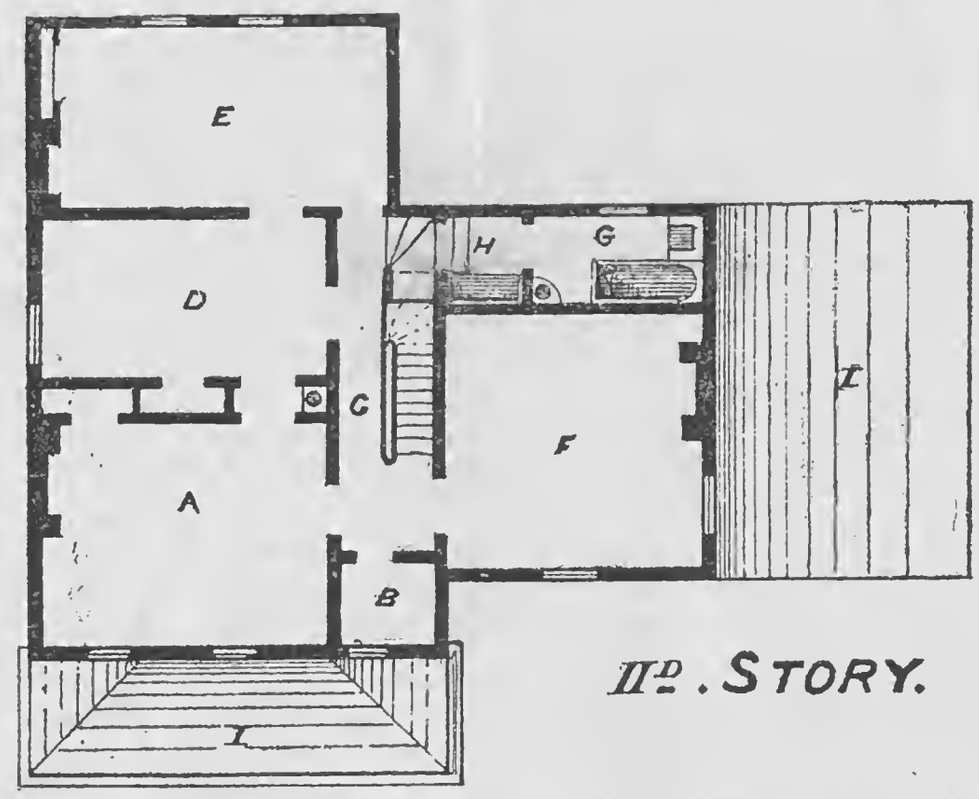
PRESERVE YOUR PAPERS.

READERS of the RURAL should preserve their old papers, and they will prove a source of amusement and instruction in after years, hardly to be estimated. I have the RURAL complete since 1865, and it is a rich treat to look over the old numbers. One will be surprised to notice how the same old questions are asked and answered again, and again, also how nearly we write as did those who came before us.

It is also interesting to examine the list of new fruits that have sprung up from time to time, all said to be better and more desirable than any that had been yet introduced. They were generally sold at high prices, had a brief existence and dropped out of sight to appear again perhaps in a still more "questionable



shape." I can find an account of Strawberries by the score, that were to supersede the "Wilson" and yet the latter still heads the list as a market variety. I have paid as high as 50c. per plant for some of these, the Dr. Nicaise for instance, and only lost my money. We have, again and again, been promised a more profitable Grape than the "Concord," but it fails to be superseded. Then run your eye over the list of new Potatoes, Squashes, Cabbages, and in fact of every kind of vegetable, grain, flour and plant. It is instructive, and occasionally as our eye rests upon something in which we so confidentially invested our money to no purpose, it is perhaps provoking.



But there is another side to this subject. In many instances we have really improved our fruits, seeds, plants, etc. I know of no better way than to invest in these new discoveries as our means will permit, "Proving all things and holding fast to that which is good."

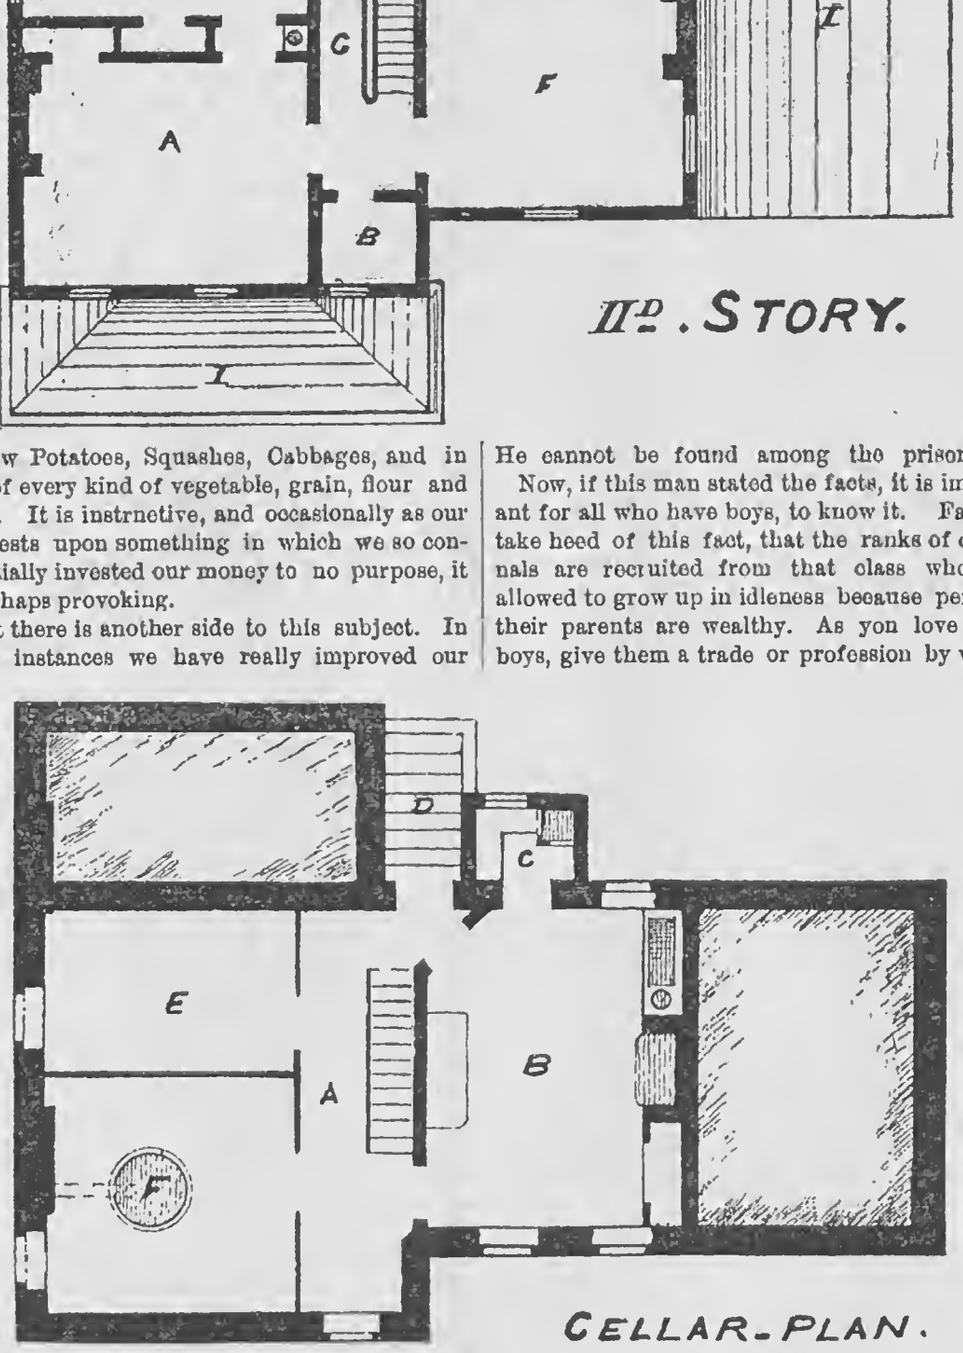
Syracuse, N. Y. NELSON RITTER.

LEARN A TRADE.

THIS is an old threadbare subject, that has been perhaps exhausted, but my attention was called to it again by the remark of one of the overseers in our Onondaga Penitentiary, a few days since. He said that he had had charge of hundreds of prisoners but had never found one that was master of a trade. He said that men came there who would give their occupation as a blacksmith, carpenter, tailor or something of the sort, but on examination it would be found that they had only a slight understanding of the occupation they professed. "I tell you," said he, "good mechanics and farmers *do not* git into *our* penitentiary; at all events, when we wish a good mechanic to superintend any piece of work, we are obliged to hire him outside. He cannot be found among the prisoners."

Now, if this man stated the facts, it is important for all who have boys, to know it. Fathers take heed of this fact, that the ranks of criminals are recruited from that class who are allowed to grow up in idleness because perhaps their parents are wealthy. As you love your boys, give them a trade or profession by which they can support themselves. N. B.

Syracuse, N. Y.



SLITTING THE BARK.

IF you do not deem this subject exhausted, I will offer, through the RURAL, my mite. Cherry trees in my neighborhood, especially those of the fast-growing kinds, are very liable to have the bark split on the south side, and when they do so, it generally uses them up in a few years. In some agricultural paper or book (those being the places where I have learned most of what I know in such matters,) advice was given to slit the bark in June. I did so with some old, cracked trees, slitting upon their north sides, by which I evidently prolonged their lives and usefulness three or four years. Some three years since I found about half of a row of thirty young cherry trees, seedlings not yet in bearing, badly cracked. I slit them on the north side, with a knife, and now all but two are nearly healed and look healthy. S. B. PECK.

PAMPHLETS, &c., RECEIVED.

PREMIUM LIST of Nebraska State Board of Agriculture and State Horticultural Society for the Twelfth Annual Exhibition, to be held at Lincoln, Nebraska, Monday, Tuesday, Wednesday, Thursday and Friday, September 23d to 27th, 1878. Competition open to the World. The brief title of this handsome little pamphlet of 60 pages, explains its object so fully that little remains for us to say beyond a word of praise for the very liberal spirit manifested in the long list of premiums offered for the best of every object of interest or utility to the farmer and his family. Not a little information is also given with regard to the "points" of various kinds of stock, especially of cattle. By the way, our Nebraska subscribers should not foget that "Arbor Day" is the third Wednesday in April, and that the liberal premium of $50 offered by the Board for the greatest number of fruit, forest, and evergreen trees, as well as those of $25 and $10 offered respectively for the greatest number of hard-wood trees, and the greatest number of cuttings set out, can only be obtained by those who have done the planting on that day.

THIRTEENTH Annual Report of the American Dairymen's Association with transactions and addresses for the year ending January 10th, 1878. This neat pamphlet of 134 pages is mainly taken up with a full report of the sayings and doings of the Thirteenth Annual Convention of the American Dairymen's Association held last January, in Cleveland, Ohio, a condensed report of which we gave to our readers at the time. It is published at the office of the "American Dairyman" of this city and as a pithy *resume* of the yearly record of dairy transactions in the country, it should be in the hands of all interested in dairy matters.

CATALOGUES, &c., RECEIVED.

LIST of Wild Plants of New England furnished by mail, post-paid, by ERASTUS S. WHEELER, Berlin, Mass.

CATALOGUE of the Waccabuc Farm, Golden's Bridge, N. Y. Jersey Cattle, Berkshire Swine, English Mastiffs and Deer Hounds.

WE have received from the PARSONS & SONS Co., their new Catalogues for 1878. We do not know of another nursery establishment that more earnestly strive to give their patrons satisfaction. The catalogue of "New and Rare Plants" will interest all who desire the newest of hardy evergreens and deciduous ornamental trees and shrubs. Kissena Nurseries, Flushing, Long Island.

L. B. CASE, Richmond, Ind. Botanical Index to the plants grown at his commercial greenhouses.

SECOND ANNUAL BENCH SHOW of the Westminster Kennel Club, to be held at Gilmore's Garden, May 14, 15, 16, 17.

GARDNER B. WEEKS, Syracuse, N. Y. Illustrated and Descriptive Price-list of Chapman's Railway Pitching Apparatus and Stacking Outfit. Took the highest award at late trial N. Y. S. A. S. Also price-list of cheese and butter factory, and dairy supplies and apparatus. Steam engines and boilers.

"GASOLOGY," a satire. Published by JOHN DONKEY & Co. Trade supplied by The American News Company, N. Y. A very remarkable satirical poem upon topics of the times, such as the Telephone, Blue Glass, Patent Returning Boards, Hell Abolished, etc., which needs to be read to be appreciated.

REPORT on the general condition of the agricultural interests of North Carolina from returns made to the Department of Agriculture, Raleigh, N. C.; L. L. POLK, Commissioner.

VIRGINIA. Her many advantages as compared with other sections of the United States. A list of farms in the Piedmont section. Address W. A. PARSONS, Goochland Courthouse, Virginia.

FACTS AND INFORMATION in relation to the Catalpa Tree. Its value and the importance of its extensive cultivation in groves. By E. E. BARNEY, Dayton, Ohio.

C. H. HOVEY & Co., Catalogue of plants, seeds, &c., 22 Tremont Street, Boston, Mass.

PRICE & KNICKERBOCKER, 80 State Street, Albany, N. Y. Spring Catalogue of the Albany Seed Store. 80 pages well illustrated.

Floricultural.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

THE IRIS.

STANDING in the foremost rank of summer-flowering tuberous-rooted plants, we find the Iris in its numerous and richly variegated varieties. It has been a favorite flower from time unknown. It was introduced into England by the Flemish immigrants in the time of Philip II., of Spain; but we learn of it much earlier than this. History tells us that King Clovis, in 485, A. D. placed three '*fleurs de-luce*' on his shield instead of three frogs which had been the coat of arms of his predecessors, which is convincing proof of its being highly esteemed and cultivated at that early date.

The Iris is divided into several sections by botanists and florists. Without further comment we will consider these several sections.

Iris Anglica, commonly called the English Iris, but for what reason it would be hard to tell, inasmuch as it is not a native of England but of Southern Europe, being most abundant in Spain, is conceded by all to be the handsomest. This variety was originally called Angelica which has been corrupted into the present title; its proper botanical appellation is Xiphioides.

The flowers of this section are much larger than those of the other bulbous-rooted varieties, and are much more delicate. Growing in a wild state the flowers are of a delicate blue but in cultivated strains we have them of every conceivable hue, deep purple, blue, white, lilac, violet, bright crimson and cherry, mottled and striped in the most fantastic of manners, self-colored and shaded. The colors so harmoniously blending and shading into each other, the most perfect form and symmetry combine to place Iris Xiphioides among the finest of garden gems.

Iris Hispanica, generally known as the Spanish Iris, botanically as Xiphium, forms as handsome a bed as any one could desire. It was introduced soon after I. Anglica into English gardens. The number of varieties of this section in cultivation is over one hundred. In color they range through brown, lilac, blue, orange, yellow and sulphur, both "self" and variegated. The center petals are usually of a different color from the exterior petals.

Iris Persica, the Persian Iris, is a magnificent variety. The lower petals are a rich royal purple, with white edges and orange streaks, the center petals are delicate blue. This variety is one of the oldest and most popular cultivated varieties.

Iris Germanica, or German Iris, is the finest of the tuberous section. It is now to be had in many beautiful named varieties, and is much more generally cultivated than the other sections. It is to be had in "self" and variegated colors—yellow, rose, blue, white, cream, salmon, royal purple, maroon, and lilac. Many varieties exhibit three or four colors in one bloom. Like all the Iris, they have an exceedingly grateful fragrance.

Iris Iberica is a new dwarf species of great beauty. The flowers are large, pure, satiny-white center petals; the exterior petals are rich brown and purple, spotted black.

Iris Susiana, popularly known as the Lady-in-black Iris, is of the rarest. It is exceedingly handsome, but being a native of the Levant it is seldom bloomed in perfection. The flowers are very large, at least five inches in diameter. It is one of the richest and most singularly variegated of the Iris. The color is a rich dark-rose, tinted and marked brown.

Iris reticulata is a recent introduction of rare merit. It is particularly adapted to pot culture, blooming in January. The blooms are very fragrant, of a rich dark violet hue.

Iris pavonia or Peacock with its handsome butterfly flowers, and I. tuberosa with its black-green edged blooms are both worthy of a place.

Take up, divide and reset the tubers or bulbs in August; they will grow in any soil but well repay a little attention in the way of a dressing with decayed manure. With me the Iris thrives best in partial shade. I use it extensively for growing in the shade of trees, and for this use I particularly recommend it to my friends who require a plant for a shady situation. Try it.

El Dorado Co., Cala.

BEAUCARNEA RECURVATA.

THIS is a greenhouse plant, a native of Mexico, and belongs to the lily family. It is cultivated in our gardens on account of its long, recurved leaves which are tough and leathery and vary in color from bright to metallic green, just according to how much exposure the plants are subjected to. These leaves are thickly produced from the top of an arborescent stem, which from its earliest development presents a remarkable bulbiform or napiform base. Indeed no better idea can be had of the habit of the plant than is shown by our illustration which is true as life. Though of comparatively slow growth

BEAUCARNEA RECURVATA.

this Beaucarnea is a handsome object either in the parlor window, the greenhouse, or "plunged" out-of-doors in the flower-garden in the summer months. When large specimens are isolated (plunged) on the lawn they are very telling, and as vase plants for standing at either side of the front door, they have few equals. They stand with impunity any amount of sun, providing they be properly hardened off before being placed out-of-doors, and if their leaves be kept dry.

For soil they like good fibrous sandy loam with a little old leaf soil, and never too much pot room. They enjoy lots of water while they are growing, but only enough to keep the soil a little moist in winter. They are very tenacious of life, and can be wintered in a good frost-proof cellar, or a room window in the case of small plants, but their proper winter-quarters are the greenhouse.

Their inflorescence consists of a large terminal panicle three to six feet long and bearing thousands of small white, fragrant blossoms. But so far as we know this plant has not flowered in the Eastern States, and as there is no ready means of propagating it but by seeds, those are imported from Mexico. It can certainly be propagated by cuttings, using as such the young sprouts that may sometimes occur or be induced on the stems, but these are not very frequent.

EXCHANGE.

MANY, many thanks for the seeds the RURAL so kindly sent. I have not a large variety of flowers, like some of our RURAL sisters, but I have some seeds I would very much like to exchange, among which are the following: Sweet William, mixed; Marigold, French, two kinds; Solanum; Candy-tuft, white; Pot Marigold; Convolvulus, mixed; Poppy; Carnation; Acrocliniun roseum. I will exchange any of the above for Wall-flower; Lantana; Salvia, Phlox Drummondii, Larkspur, Stock-flowered, or any hardy climbers. I have also Gladiolus bulbs, and Dahlias, three colors, red, white, yellow, that I would like to exchange for other colors. Those wishing to get some seeds and having nothing to send in return, if they will send me a stamped and addressed envelope, I will forward them seed by return mail.

MRS F. K. GRIFFIN.

De Golier, McKean Co., Pa.

I WOULD like to exchange with RURAL readers, flower seeds or rooted slips or plants. I would like Verbena seed, Pansy, Ten Week Stock, Double Hollyhocks, white or pink, and Gladioli sets. I will give for these, Portulaca, Morning Glory, Sweet William, Perennial Larkspur or Bee Larkspur, very hardy and large blue flowers; White Musk plant or seeds very nice for cut flowers; Perennial Peas, white and pink. I have a great variety of hardy Roses, and can furnish rooted sprouts, also Flowering Almonds.

Happy to receive letters, seeds or plants soon, with such direction for exchange as is required, I remain obedient to directions,

MISS LIZZIE M. LUTTS.

Youngstown, Niagara Co., N. Y.

Everywhere.

RURAL SPECIAL REPORTS.

ELBERT CO., Colorado, April 6.

I AM living away out here in what Olney calls the great American Desert. In my school-days I imagined it was a great wilderness of sand where no green or living thing could exist. I find it very different from what my imagination pictured it. The sand is here certainly, and you may travel for twenty miles and not see a tree, but the plains are covered with the nutritious buffalo grass as well as with wild flowers. The buffaloes are not so numerous as they were a few years ago, but there is plenty of smaller game, antelopes, Jack rabbits, ducks, wolves and the mischievous Cayote which we wish were not so numerous. But, best of all, are the great herds of cattle that increase and keep fat on the rich grass. Life on the plains is not without charms. 'Tis true, we are isolated from all the church privileges and public amusements that diversify life in the East; but the free life we lead and the pure air we breathe make up for the loss of society.

About the first of May commences the busy season in this country, and from that time until about the first of November the stock-men are all busy gathering, branding and shipping cattle. Then from that time until the next May we have nothing to do but visit, read, write and enjoy life as well as we can, and we make the most of what few enjoyments we have, and enter into them with so much zest that we get more pleasure out of them than any one could imagine that had never tried. Every man, woman and child have their horse and saddle and think nothing of riding ten, twelve, or even twenty miles to visit a neighbor. We have good roads, a level country and no mud. The land is so sandy that in an hour after a heavy rain the ground is dry. But it very seldom rains—I might say never from November until May, and indeed we do not have much rain at any season.

We cannot raise vegetables without irrigating and there are very few locations where you can command water for that purpose. We are not here, however, to cultivate the ground but to raise cattle.

Many of the RURAL'S Eastern readers will wonder how we can boast of our fat cattle, rich grass and fine flowers in a country where there is so little rain. Indeed were they to see our prairies they would say it was impossible for cattle to live, but when they behold the stock and saw that the majority of them were fat enough for good beef even in March, they would understand that the grass grown on our dry, sandy prairies, though short, is very rich; and were they to transfer our grass and flowers to the East, they would die from excess of water.

M. V. SNYDER.

COSHOCTON, CO., Ohio, Feb. 27.

I WAS very much interested in reading your articles, some time since, on healthfulness of plants in living rooms, as I keep a large number in mine, and would have been sorry to hear you condemn the practice too severely; but I try to keep mine as near as I can to what you recommend in your articles. In the first place, I had some pans made by a tinner, just the length of the window-sill, and wide enough for about three rows of pots, setting the lowest plants next to the window to keep the pan in place. I have two turned legs fastened on a strip to slip under back of the pan. This I keep well painted to preserve it from rusting. It keeps all water off the carpet if I happen to spill any in watering. I slightly warm the water, putting in a small quantity of ammonia, which I think keeps the pets looking healthy. At least such is the effect on mine. Of Geraniums, my double salmon, has not been without blossoms this winter. It does better for me in blossoming than any variety I have. Of Abutilons, Boule de Neige with me has blossomed all winter. With regard to Primroses, I can't say enough in their favor. Maderia Vine makes a beautiful climber, standing almost all kinds of usage in a living room. I have one trained over the window and pictures, which is beautiful with its thick, rich-looking leaves.

MRS. CATHARINE MCCOY.

BROOKSTON, N. C., April 1.

IT may seem strange to hear one speak of a drought in March, but certainly we have had a little touch of it here, the whole month being quite dry, though two fine showers during the past week have brightened the face of nature wonderfully. We had only one severe frost and that on the morning of the 26th. Owing in great measure to the dryness of the earth and atmosphere but little harm was done. Fruit all safe yet. Peaches dropping their petals. Apples, Pears and Grapes in full bloom, and Grapes rapidly pushing out. Wheat is, at least, ten days later than last year, but has a good color. Plowing mostly done except on stiff lands, where the dry time has put a stop to operations. March came and went like a lamb, contrary to all the proverbs of the weather prophets.

M. B. P.

FELTS MILLS, N. Y., April 9, '78.

WE have had a mild winter, and the spring so far, is correspondingly warm. Maple sugar makers have just gathered in their buckets. The make of sugar is below the average. Farmers are busy getting ready to put in their grain. A few pieces of wheat have been sowed in March. There seems to be a general disposition of the butter-makers of this section to go into cheese making the coming season. Some cheese factories have commenced making cheese. Butter is worth 25 cents per pound; maple sugar 7 to 9 cents; eggs 8 cents per dozen; oats 32 cents per bush.; potatoes, 35 cents.

S. W. M.

YATES CO., N. Y., March 30.

MARCH has tried to be consistent and go out like a lion having come in very lamb-like, but it is pretty nearly a failure. Last Sunday, the 24th, was pretty severe; the thermometer here was at 10° with a cutting northwest wind. Peaches were considerably advanced and it was feared that they might be seriously damaged, but the buds look all right as yet.

W. H. OLIN.

WESTBOROUGH, Mass., April 12.

IT begins to look very much as if spring were at hand; plants and trees show the effect of our mild April weather by bursting the leaf envolope.

W. H. W.

MONTGOMERY, Ala., April 5.

WE have hereabouts a very rich prairie soil, adapted to corn and cotton; oats also do well. We have some farmers who are devoting a good deal of their time to stock-raising.

B. C. M.

The Querist.

ANSWERS TO CORRESPONDENTS.

Making Capons.

Chas. Bennington, Otsego Co., N. Y., inquires how capons are made.

ANS.—The best birds for capons, are the large breeds, Asiatics or Dorkings. They should be two to three months old. Before the operation they should be deprived of food for from twenty-four to forty eight hours, so as not to have their bowels distended. There are instruments made for the operation, which can be purchased in most cities.

The bird to be operated on, must be fastened down on his left side to a board or bench through an auger hole; the wings should be drawn together over his back and well secured; the legs drawn backward the upper one drawn out furthest and secured. The feathers must be plucked from the right, or upper side, near the hip joint, on a line with and between the joint of the shoulder. The space uncovered should be about one and a-half inch in diameter on an ordinary-sized bird. Draw the skin of the part backward so that when the operation is finished the skin slides back to its natural position and covers the wound in the flesh, and does *not*, when neatly done, require sewing. Make an incision with a fine sharp penknife (or proper instrument is best), between the last rib and hip, commencing about an inch from the back-bone; extend it obliquely downward, from an inch to an inch and a half, just cutting deep enough to separate the flesh; take great care not to wound the intestines. The wound must be kept open with an instrument with a spring, called a retractor, or with something answering the same purpose, stretching it wide enough to afford room for the work. Then, carefully cut the membrane covering the intestines which, if not sufficiently drawn up, may be pushed towards the breast-bone lightly by a spoon-shaped instrument, or the handle of a teaspoon. The organs to be removed are readily recognized—a small reddish-yellow cylinder attached to the spine on each side, covered with a fine membrane or skin which must first be removed with forceps and a fine hook to draw it away. With the left hand introduce the bowl of a spoon (an instrument is made for the purpose) under the lower or left testicle, which is generally a little nearer to the rump than the right one. Then take the instrument called a cannula, which is a hollow tube with a horse hair passed through it forming at the end a loop which can be tightened by pulling on the two ends of the hair at the other end of the tube. Pass this loop around the testicle with the help of something to place it in position, the cannula has a hook for this purpose, so as to bring the loop to act upon the parts which connect the organ to the back. Then by drawing the ends of the hair-loop backward and forward, and at the same time pushing the lower end of the tube or cannula, towards the rump of the fowl, the cord or fastening of the organ is severed. A similar process is then to be repeated with the uppermost or right testicle, after which any remains of the organs together with the blood around the wound or at the bottom must be removed with the spoon. The reason for operating on the left or lower organ first is to prevent the blood from covering the lower one if left last. When the operation is performed, which if skillfully done occupies but a few minutes, the retractor is taken out, the skin drawn over the wound, which if it was drawn on one side before cutting (as mentioned above), will connect at a place not exactly opposite the wound in the flesh, thereby covering the flesh wound. If skillfully done it requires no sewing. The old French system was to operate on each side of the fowl, but the system here described is considered an improvement on the antiquated Gallic method.

Salt as a Fertilizer.

S. P., Center Village, Broome Co., N. Y., having seen salt recommended as a fertilizer, inquires what quantity should be used and on what kind of soil and crops would its effects be beneficial.

ANS.—The uses of salt in agriculture are far more frequently discussed than they are understood. It is chiefly valuable for the very large proportion of soda contained in it, and this generally exists in the soil in considerable quantity. Its action may be beneficial, is often the reverse and not seldom neutral. For purposes of promoting vegetation it has been found specially useful in inland districts, because to a considerable distance from the sea, rain always brings down an appreciable quantity of salt, amounting near the seaboard, in an annual rainfall of 31 inches, to a deposit of 641 pounds of salt to the acre, according to the calculations of Dr. MADDEN. Numerous experiments in Europe go to prove that its application has produced a considerable increase in the yield of wheat, barley and oats besides strengthening and brightening the straw. Prof. WAY states that ammonia-silicate is much more soluble in a solution of common salt than in pure water, and as the silica in cereals is probably largely derived from this source, and the ammonia is also thus liberated, the action of salt on these crops is readily intelligible. From 10 to 20 bushels to the acre have been applied beneficially to them, experience determining the exact quantity that produces the best results on each kind of soil. Experiments have also shown that lime slaked with a strong solution of brine, is superior as a fertilizer to ordinary slaked lime, with or without a separate application of salt.

The use of salt for root crops is also recommended, and since, on analysis, turnips contain 2 pounds of salt to the ton and mangolds 6½ pounds, the reason why they are benefited by a saline application is apparent. Experiments made by Dr. VOELCKER show that while weak solutions of salt benefit cabbages, field-beans, onions, lentils, annual meadow-grass, radishes, and several noxious plants experimented on, applications progressively stronger had an injurious effect in the following order: A salt solution containing 48 grains to the pint was prejudicial in a month to lentils, chickweed, groundsel and annual meadow-grass. A solution containing 96 grains to the pint, was injurious to cabbages and field peas. A solution of 192 grains to the pint was prejudicial to onions, and nearly fatal to cabbages. A solution of 24 grains to the pint decidedly benefited radishes, onions, lentils and cabbages. Grasses were more readily affected by salt than any plants he experimented upon. Bulbous plants and those with succulent leaves were especially benefited by the application of salt.

BERTHOLLET says that in a calcareous soil salt is decomposed by the carbonate of lime the soil contains, and that by a double decomposition carbonate of soda and chloride of calcium are formed. Now, carbonate of soda dissolves silica so as to supply it to the plant in a readily available form, and is also a solvent of phosphoric acid, organic acids, etc., and may therefore exercise a beneficial effect by carrying these constituents into the vegetable organism. Experience with salt as a fertilizer is not yet sufficiently large to determine on what kinds of land it will produce the best effects; but where it is neutral or injurious to the crops above enumerated, observation has shown the following conditions: The soil has been supplied with sufficient salt from the sea or local deposits; the land is naturally poor and ill manured, and then the application of salt will do little to raise its fertility; salt is given to stock pastured on the land or whose manure goes on it, so that it received an ample sufficiency from the supply necessarily contained in the voidings of the animals.

The whole question of the effects of salt on soils and crops needs more study before an accurate opinion can be formed on the matter. Every farmer who uses the article in this way and carefully notices the result, is an experimenter whose knowledge, if properly made known to the public, would contribute often very beneficially towards the general fund of practical agricultural information.

Dry Yards: Leicester and Cotswold Sheep: Norway Spruce Wind-Breaks.

W. H., Iona, Mich., wants (1.) a plan for keeping his yard dryer, as it is now a mass of mud except where well littered. Building on north side of road; yard open to, and facing the south, inclosed on three sides; land slopes one foot in sixty; soil clay; plenty of small stones at hand, and of sand about a mile away; till obtainable for drainage; but he is very properly anxious to retain all the liquid manure he can. 2. He asks what is the difference between Leicester and Cotswold sheep, and in their wool. 3. He likewise wants to learn at what distance apart Norway Spruce should be planted for a wind-break, and how many rows in width.

ANS.—1. The yard should slope the opposite way and the buildings should have spouts to carry all rain water into cisterns or right-away. Waste water or any little streams running from the road or from any direction and finding their way into the yard should be carefully diverted from that direction. The small stones would be just the thing and might be put thick enough to thoroughly prevent any mud in future. In England wherever stones can be had they are broken small and put two feet thick and, in this instance, if door-ways will allow, the stones could be put so thick on the present lowest part of the yard as to make it the highest. It is a great injury to the manure to have so much moisture. Don't spare the stones and they will be sure to pack without sand.

2. The Cotswold sheep have wool on the top of the head, quite a bunch, and they have more on the legs. The wool is rather coarser and the fleeces heavier. The weight of the Cotswold is greater at a year old by at least 30 pounds, and before dashes of Cotswold blood were given to the Leicesters there was a greater difference. The Leicesters will fatten very quick but there is less lean in proportion to the fat. The wool from the Leicesters formerly made a little more per pound, being of very fine quality.

3. If Norway Spruces are planted for a wind-break or screen in a single row, eight feet apart is about the proper distance. If room can be afforded, two or more rows are better, and then the trees should be set in each row opposite the spaces between those in the next, and at a distance of, say five feet from the center of the space. The actual distance then between the trees will be the hypothenuse of a triangle the other ends of which are five and four feet.

Gas Lime and Barn-yard Manure.

Walter Severly, Venango Co., Pa., inquires 1. WHAT is the comparative value of gas lime as a fertilizer, on what kind of soil and in what quantity should it be used. In his section stable manure costs 50 cents per load at a place from which four loads can be hauled in a day; and gas lime $1.50 per load, at a point whence only three loads can be drawn daily to his farm: Which should be taken?

ANS.—In view of the relative prices of gas lime and barn-yard manure, here given, the greater ease in hauling the latter, its suitability to all kinds of crops and the safety with which it may be everywhere employed, it has in our opinion a very decided advantage over gas lime at the figure quoted. The latter has, in reality, but comparatively little fertilizing value, requires time to fit it for application to any crop except to one of weeds, and, apart from this exception, should always be used with caution. When fresh, it is a mixture chiefly of sulphuret of calcium with carbonate of lime and a variable quantity of caustic lime, and in this condition its application to plants would be disastrous. By exposure to the air for three or four months during which it should now and then be turned over, the poisonous sulphuret of calcium absorbs atmospheric oxygen, and is converted into a cheap sort of gypsum. Spread upon mowing or pasture land at the rate of three tons to the acre, it would have a good effect on the subsequent crop; and its influence, properly weathered, would be beneficial wherever an application of gypsum would produce good results. It should be used in moderate quantity and with caution, as an application of eight tons to an acre, has been known to entirely destroy vegetation.

Broody Hens—Food for Chicks.

A Subscriber, Lincoln, Loudoun Co. Va., has two Cochin hens from which he would like to raise as many chicks as possible, and therefore inquires whether when they become broody, it would be advisable to break them up so as to induce them to lay again. He also asks, what is the best feed for very young chicks and whether broom-corn seed is good.

ANS.—You can sometimes break up the sitting fever of your hens, by putting them in an empty coop on the ground without nest or food, which can be repeated as often as they are inclined to sit. By so doing you can get more eggs from your two hens—many breeders do this. The best food for young chicks is variety, as oatmeal, cracked corn, buckwheat, wheat and rice slightly boiled. Boiled egg is good for them when first hatched for a few days as is paste made of the corn meal, oat meal or wheat meal. As soon as chicks can eat broom-corn seed it is good.

Bone Dust and Barn-yard Manure.

J. W. S. inquires whether it would be advisable to use bone dust as a compost with barn-yard manure.

ANS.—Yes. Many excellent farmers consider such a method of employing bone dust second to none, and in our own experience it has proved highly satisfactory. In piling in the spring, place a layer of manure, say eight inches thick, for a foundation, then a sprinkling of bone dust, say at the rate of a bushel to what will make a ton of manure, and continue these alternate layers until the heap is finished. Turn it over in August and after the winter wheat has been gathered in, the compost will be in prime condition to be applied to grass land. It is an excellent application to permanent pasture or for meadow land intended to be broken up for corn the following spring.

Feeding Sorghum to Horses.

E. H. Field, Kansas, asks how Sorghum should be fed to horses.

ANS.—The seed is sown as soon as the ground is warm—best in drills, and encouraged by some cultivation, especially in weedy land. The green crop may be cut and fed as soon as it attains a suitable hight, and is as acceptable to stabled horses as it is to cows, but it must not be fed so freely as to produce laxity of the bowels. When fully grown and before the seed forms, the stalk becomes quite sweet, and it is then fit to cut for curing like corn fodder—thoroughly wilted, bound in bundles, set up in stooks which are bound at the top like corn stooks to protect them from the weather. Thus drying, when cured it may be fed freely to horses or cattle, best, of course, with hay and other feed. The grain is fed ground usually, but we know no reason why it should not be used like oats or barley.

The Swine-Herd.

MANAGEMENT OF YOUNG PIGS.

PROFESSOR E. W. STEWART.

THE science of feeding animals is becoming much better understood, and the best feeders are fast changing their ideas of the proper management of young animals. It is not long since pig feeders thought a slow, early growth the best for the constitution, and even the profit of the feeder. This was carried to such an extent that pigs were not ready for market till 18 to 24 months old; and it was thought desirable to reach a weight of 400 to 600 pounds. The storing system, or suspended growth, was almost universal. Pigs were kept over winter with little if any increase in weight The feeders did not seem to discover that this food given to store animals was even worse than lost, for the animals took on an unthrifty habit, contracted their powers of digestion, and required, in spring, nearly a month of good feeding to recover from this penurious winter feeding. A thrifty animal, with good management, progresses without check from its first to its last day. When a little attention was given to the matter, it became evident that the profit of growing meat was to be found in pushing the young animal as rapidly as possible, that it cost the least to produce a pound growth in the earliest period of life, and this cost in food grew proportionately greater as the animal increased in age and size. This, then, is the great fact underlying all successful feeding of young animals. The pig is, perhaps, the best exemplification of this law, at least more experiments have been noted in feeding pigs than calves.

Experiments were tried in 1866-68, at the Michigan Agricultural College Farm. In the first, three, and in the last, six pigs were fed upon milk. The pigs were from 4 to 6 weeks old at the commencement of the experiment. The average amount of milk required to produce a pound live weight, was: first week, 6.76 lbs.; second week, 7.75 lbs.; third week, 12.23 lbs.; fourth week, 10.42 lbs. PROF. MILES says the cause of its requiring a greater amount of food the third week is explained by a "derangement of the digestive organs during this week, as shown in a tendency to constipation." He calls attention to the fact that "the milk to produce a pound live weight constantly increases." After ending the experiment in 1868 on milk, he continued it upon corn meal. Pigs and food were weighed as before, and the feeding continued 20 weeks, divided into five periods of four weeks each. Amount of corn meal required for a pound live weight was: first period, 3.81 lbs; second, 4.05 lbs.; third, 4.22 lbs.; fourth, 5.24 lbs.; fifth period, 5.98 lbs. Another experiment was tried in 1869 with a larger number of pigs, with nearly the same result, in regard to amount of meal required to make a pound of live weight, and showing, practically, the same increase in the food required to make each additional pound live weight as the pigs grew older or heavier.

The point here illustrated is of the highest importance and should be carefully studied. It will be seen that in the fifth period, when the pigs were from 24 to 28 weeks old, it took 75 per cent. more of meal to put on a pound live weight, than in the first period, when the pigs were 8 to 12 weeks old. In 1874 the writer tried a similar experiment with ten calves upon skim-milk running through 12 weeks, in which the milk constantly increased from 11.02 lbs. the first week to 17.01 the last week.

That most pains-taking experimenter, J. B. LAWES, of Rothamsted, England, has also settled this question in the same way proving conclusively that all profitable feeding of animals for human food must be made before the animal reaches maturity.

These facts all point to the importance of feeding the young pigs in the most liberal manner. Some breeders think it quite sufficient to stint the pig to the milk of the dam, and thus seldom give any extra food to even a litter of ten pigs. But such breeders have not estimated the amount of food required to feed a thrifty litter of eight pigs. Pigs, at birth, seldom weigh more than three pounds each, and when four weeks old, should weigh 15 to 18 lbs. each and must therefore gain 12 to 15 pounds each, which is an aggregate gain of say, 112 pounds. This requires the sow to yield milk enough, each day, to produce a growth of four pounds live weight; and the production of milk by the sow, weighing, say 300 lbs, equal to that of a cow weighing 800 to 1000 pounds. How important then, that the pigs should be taught to eat other food very early. This subject will be continued.

Erie Co., N. Y.

THE MODERN CRICKET ON THE HEARTH

To be Withdrawn the 1st of July.

How to Secure an Elegant Time-piece without Cost and with very little Trouble.

THE OFFER ALL THAT IT WAS REPRESENTED AND MORE.

The Cricket for Two New Subscribers.

IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH, And May be Carried from Place to Place in a Trunk or Valise.

We want the Rural Cricket Clock in the Home of Every Subscriber.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

To judge by its appearance many who have not seen it before, estimate its value to be ten dollars. We have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, *will be repeated during the present year*. Meantime, the RURAL itself has been enriched in all its departments, by contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

ECLIPSES EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam, which is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.

NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secure the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5.00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

We will send the RURAL NEW YORKER for one year and the Cricket Clock to any one upon the receipt of $3.50.

RURAL NEW-YORKER, 78 Duane St., N. Y.

WHAT THEY SAY OF IT.

SIXTH WEEK.

The Rural Cricket to be Withdrawn, positively, the 1st of July.

The most Liberal and Valuable Present ever before offered by any Journal.

ALL ARE PLEASED AND THE RURAL IS HAPPY!

"WE have received several premiums from other papers, but never before one worth as much as it was set forth to be worth."

"CRICKET" clock at hand. It is a pretty little affair and ticks away as if it meant business.
Rolling Prairie, Wis. L. L. F.

I HAVE received the "Cricket" all right, and am very much pleased with it. I set it going with my my old clock and it has not varied one minute in a week. B. M. S.
Lodi, Wis., April 1, 1878.

I THANK you—we are pleased with the clock. I will try and get new subscribers in the future to my best ability in return. Respectfully yours, MRS. L. J.
Bethlehem, Conn., April 8, 1878.

THE Clock came promptly, safe and sure, and a capital thing it is. We are very much pleased indeed with it. It is nicer than we anticipated. I have regulated it to run with a weight and pendulum clock precisely. Please accept our many thanks for the beautiful present, for the RURAL itself is well worth the full amount sent to you. F. S. S.
Litchfield, Conn., April 8th, 1878.

THE "Cricket Clock" arrived safely by express a few days ago, and is an excellent time-keeper and quite a novelty; am well pleased with it and your paper. I am free to say they are all you claim, and are well worth the money. I consider the "RURAL NEW YORKER" the best weekly paper published on Agriculture in the United States. A. D. C.
Keys, N. C., April 8, 1878.

DEAR SIR:—From the premiums I have received from the RURAL, I had reason to expect the "Cricket" Clock to be everything it is represented to be, but I confess I was agreeably surprised when I saw it. It was received a week ago by one of my children who let it fall upon a hard board floor. It seems to have sustained no injury whatever—not even a dent in its solid nickel frame and it has ever since been keeping perfect time. It is certainly a thing of beauty. Next week I expect to get another from you.
Carson City, Nev. J. B. D.

I RECEIVED the "Cricket" Clock. I wound it up and it commenced with a speed which I never saw equaled. It beat the Irishman's watch which he boasted had beaten the big town clock two hours in half a day. The regulator had no effect on it, and at last, after running about 12 hours, it got mad and stopped. I was going to the village where a man is noted for making all time-pieces travel with his regulator. He took it to pieces, found out the trouble, and now it is keeping true time. I like it and would not part with it. D. M. C. B.
Mansfield Centre, Conn.

GENTS—"Cricket" arrived all safe to-day. All who have seen it say it is just splendid. It has been going four days and keeps absolutely good time; a perfect gem in every respect. It now adorns the dining-room mantel. Please accept my sincere thanks for same. J. E. S.
Morrisania, N. Y., April 10, 1878.

N. B.—My brother who has just arrived from Mt. Vernon pronounced it a regular beauty. For the next five minutes I was busy answering questions he asked in regard to it. I need not say that I gave him full instructions; he intends to try and get one. J. E. S.

DEAR SIRS:—Your splendid premium—or gift I prefer to call it—was received last evening. This is my second "Cricket;" the first (which I haven't thanked you for yet) I disposed of after I had had it about ten days, for $2 50. I have had an offer for this one already but shall not sell it until I am sure of getting another. Every one wants the RURAL, and they say it is hard to get along without it, but money is so scarce in this section! I can get several half-yearly subscribers who do not feel like laying out more money just now. If I send you four names at $1.30 for six months each, will that entitle me to a "Cricket" clock the same as two yearly at $2.50 each? MRS. A. M.
Selma, Ala.
[Yes. EDS.]

ALTHOUGH I am rather late in acknowledging the receipt of the "Cricket" sent me, it was not the less appreciated. It came safely, and we return many thanks for it. I kept it a few days only, but in that time I found it such a pleasant little visitor my generosity nearly forsook me when it came time to part with it. I hope sometime I may obtain one for myself. My machinest brother had to see the inside of it, of course, and I believe he was quite satisfied with his examination, finding the works all they are represented to be. He and his wife were much pleased with it. I think it well worth its price. All the young RURAL readers should have one. Placed on a bracket they could not have a prettier or more useful ornament. M. E. P.
New London, Ohio, April 9, 1878.

Trees, Seeds, Plants, &c.

AMATEUR CULTIVATORS GUIDE

☞ Florists and Market Gardeners supplied with the most Reliable Seed.

Choice Seeds A Specialty.

A work of 150 pages, beautifully illustrated, containing descriptive list of the rarest as well as the novelties in both Flower and Vegetable Seed. SENT ON RECEIPT OF TWO THREE CENT STAMPS.

Address,
CURTIS, COBB & WASHBURN,
65 Tremont St., Boston.

FOREST ROSE STRAWBERRY PLANTS.

NOW READY.

This is the *largest, most uniform, healthiest*, most productive bearer yet known *in the world*.
Send for Catalogues, 1, 2, 3, 4. LEO WELTZ,
Nurseryman, Wilmington, O.

NEW & RARE ROSES.

We offer from our list of over 500 varieties of Roses, Well grown plants from Pots or Field Culture. One-year plants, Hy. Perp., our selection, at $3 per doz., $20 per 100. Teas and China, $2.50 per doz., $16 per 100. Young plants per mail, $1 per doz., $8 per 100. Also the rarest and choicest Evergreen and Ornamental Trees and Shrubs of all varieties for planting in Lawn, Yards, etc.
MILLER & HAYES,
MOUNT AIRY, PHILADELPHIA, PA.

SEED CORN.—EARLY CHINESE—156 bushels shelled per acre. Ears 16 to 20 inches long. Send $1 a quart or $3 a peck.
Address C. WADE, Battle Creek, Mich.

GARDENERS!—DO YOU WANT TO RAISE vegetables from two to four weeks earlier? Use Soluble Transplanting Pots! For particulars, how to make them, etc., address, with stamp,
TUISCO GREINER, Naples, N. Y.

KAKI or Japanese Persimmon

A new and delicious Fruit.

SPECIALTIES: **Magnolias, Japanese Maples, Rhododendrons, Hardy and Chinese Azaleas, Roses and Camellias.**

An immense collection of **Fruits and Ornamental Trees and Shrubs.** All **THE VERY LATEST NOVELTIES.** Price-List FREE. Descriptive Catalogue, 10 cts.
PARSONS & SONS CO.
(Limited,)
Kissena Nurseries, Flushing, N. Y.

SEEDS.

Garden, Flower & Field Seeds,

Reliable, fresh and pure, at reasonable prices.
(ESTABLISHED 1839.)
STAIR & KENDEL,
Cleveland Seed Store, Cleveland, Ohio.

THE DINGEE & CONARD CO'S BEAUTIFUL EVER-BLOOMING ROSES

We deliver **Strong Pot Roses**, *suitable for immediate flowering*, safely by mail, at all post-offices. **5 Splendid Varieties**, *your choice*, all labeled, for **$1**; 12 for **$2**; 19 for **$3**; 26 for **$4**; 35 for **$5**; 75 for **$10**; 100 for **$13**. Send for our **NEW GUIDE TO ROSE CULTURE**, and choose from over 500 finest sorts. Our **Great Specialty** *is growing and distributing Roses*. THE DINGEE & CONARD CO., ROSE-GROWERS, West Grove, Chester Co., Pa.

Evergreens for Lawns, Cemeteries, and Ornamental Grounds.

Norway Spruce, 3 to 4 feet high, strong and bushy, for shelter belts at very low rates by the car load. Also the largest stock of Nursery grown Evergreen and Forest Tree Seedlings in America. Evergreen seeds. Send for Catalogue. ROB'T DOUGLAS & SONS,
Waukegan, Ill.

ROOT'S RELIABLE SEEDS.

Send for MANUAL for 1878.
"Fresh, practical and sensible."—*Am. Agriculturist.*
Address J. B. ROOT, Rockford, Ill.

A WONDERFUL NEW RASPBERRY.—The New Rochelle produces 500 bushels to the acre; 12 plants will produce two bushels. 1,000,000 Strawberry plants. Crescent seedling and Great American, $1 per doz. Send for Catalogue. W. S. CARPENTER & SON, Rye, Westchester Co., N. Y.

SPLENDID **FLOWERS** OVER 1200 Distinct Varieties

All Strong Plants, each labeled and delivered safely by mail. **Largest assortment. Low prices.** We have been in business **24 years**, and *guarantee satisfaction*. Our stock of **ROSES** *comprises all desirable varieties*, and contains none but mature plants. We send *purchaser's choice* of **6** for **$1**, or **13** for **$2**. THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, APRIL, 20, 1878.

We beg to call attention to the fact that we have, during the past six months, repeatedly stated that we should endeavor not only to fulfill all of our promises for the present year, but that we should endeavor to do more. We think we have already given substantial proof of the sincerity of those statements. We have now to announce that we have determined upon enlarging the RURAL NEW-YORKER. Further reference will be made to this change at an early day.

As we intimated when the announcement was made, it was intended to offer the RURAL Cricket Clock only for a brief period. We now give notice that the offer will be withdrawn on and after the first day of July. It was our desire that one should be placed in the home of every one of our subscribers, and we think ample opportunity will by that time have been afforded.

LUCK—OR LABOR?

THERE is an old saying, "It is better to be born lucky than rich." We have little confidence in any luck that a man does not make for himself. And a man's luck, so-called, is often traceable to some act done, or to some point in his character, that has been carefully cultivated, not with reference to any particular transaction but on general principles of proper conduct and growth. When one man succeds by *luck* a hundred fail. Witness Wall Street transactions, or gamblers anywhere—what is credited to luck is often due to caution.

In conversation with a man well known in business circles in Boston, who is now the possessor of much wordly wealth, every dollar of which he has made for himself, he said, "I have never embarked in any enterprise thinking how much profit I could make by it. My rule has been to look out for the losses, and to guard against them leaving the profits entirely out of the calculation. Many say profits cannot be made in any business without risk. I have tried to act on a different principle. My first inquiry always has been, if I put money into this or that venture, 'Can I get it back again?' and if the answer seems doubtful I let it alone. I have never been led into speculation by the thought: there is but little risk, and if successful the profit is great. And I have never lost in the end, on any business venture I have ever made."

A good reputation, which never comes by luck, is to any business man a long step toward a fortune. The man who is considered honest by the people among whom he resides, and who is known for being prompt in his payments, has a reputation that will serve him for business purposes, better than property serves one who is tricky and uncertain.

Our attention having been called to the fact that the stock of the Insurance Companies of Hartford sold for much above their "Book value"—that is the amount that could be paid to shareholders from the assets should the company discontinue business at once—while that of the best New York Companies can always be bought considerably below book value although the percentage of dividends paid was about the same, we were curious enough to inquire the reason. We first asked a President of a N. Y. Company, who gave no further information than that all the Hartford stock was wanted for investment by the people of that city and its immediate vicinity, and because it was a favorite with them they willingly paid a high price. He gave no reason why it was a favorite—afterward we inquired of the agent for one of the Hartford Companies located here. The "reason is plain" he said, "it is because of the reputation for soundness and fair dealing we have established throughout the entire country. If our company should to-day sustain sufficient loss to exhaust its entire capital in the payment of it, we could continue. Our reputation is worth more than the entire capital of some companies."

But a good reputation does not come without being sought. It follows in the wake of honesty, integrity, morality; its foundation stones are right thoughts, which must come before actions or words, and which control them.

We do not hold that there are no instances where fortune in its various forms has not come to men without their seeking it. Many have stood in the way of circumstances and have been benefited by them, but what we would impress upon the minds of our readers is that he who waits for luck is usually disappointed. He who would win must work.

BORROWERS AND BORROWING.

SHAKSPEARE, the wonderful expounder of human nature said, "Neither a borrower nor a lender be." A greater than the immortal dramatist has taught the duty of brotherly kindness and timely assistance. We must give respect and obedience to the higher authority. But to this, as to all other divine injunctions, it is not only legitimate but obligatory to apply righteous judgment and carefully to decide every case by its peculiarities. It is certain that it is not required of any one to lend indiscriminately and recklessly. There must be some reasonable limit. Here, as in all matters involving one's relations to his fellow men, duty is made clear when one intelligently and carefully applies the Golden Rule—"Do unto others as you would that they should do unto you." This will guide both the borrower and lender. Let him who would borrow, imagine himself in the place of him to whom he is about to apply; and let him who is asked for the favor imagine himself the applicant. Let each decide what he would regard as reasonable and right in this imagined relation.

Our prime object here is to enter an earnest, considerate protest against the unwarrantable excess to which the practice of borrowing is carried in some communities. It has an evil effect upon both the borrower and lender. It prevents the borrower from making proper efforts to obtain what he needs so as to have his own. It causes him, if he relies on it, to be disappointed often, and consequently to lose the best opportunities to attend to his own interests. It often occasions serious loss of time—and that at the crisis when time is most valuable. The journey to and from the house of the lender consumes, it may be, the best part of the favorable opportunity. The custom sometimes proves very expensive, when that which is borrowed receives injury that must be accounted for. It also diminishes the borrower's self-respect, compromises his independence, lowers him in the estimation of those whom he plies with his frequent requests, and renders him an undesirable and quite dreaded neighbor. It is peculiarly likely to result in practical dishonesty, as the means or instruments are used, worn, injured, in many instances, and no rent or remuneration is paid; so that the borrower owes what he never pays.

The lender is much injured by these borrowing neighbors. He dislikes to appear illiberal, and, therefore, frequently lends when he does not enjoy it, and when he is not able to spare. He does not know, every time, when he will really need that which he is asked to lend. It not unfrequently happens that when there is immediate and important demand for some article, the annoying discovery is made that it is at the house or farm of a neighbor who borrowed it weeks before. Then the pressing interest must suffer, without any prospect of compensation. How often has the farmer been sorely perplexed to find that his plow, or hoes, or spades, or harrow, or harness, or bridles or saddle, or barrow, or ax, or forks, or scythes, or saw, or hammer, or auger, or plane, are away at the house of a troublesome neighbor? How often is a horse, or wagon, or other vehicle, needed just one hour after it is carried off by the borrowing friend? (?). The thrifty and economical man likes to keep his utensils in good condition; but that is impossible, if he has to lend them; for frequent borrowers are generally such as take little care of their own or another's property.

It should be remembered that a discreet, provident man supplies himself with what he thinks his own work requires; and does not add to his stores what his neighbors will need, and ought to get for themselves. If we thought the ladies would read this article we would add a paragraph for their benefit; for the borrowing practice very frequently tells fearfully upon housekeepers. We will, however, simply commend the subject, in this connection, to some of the accomplished female contributors to our columns. We are sure that the whole subject needs more attention than it receives from the various journals that are devoted to the true interests of indiviuuals and society.

There is urgent need for some change in the matter, that will lead to a reform of the inexcusable, borrowing pests. One idea occurs to us as likely to have a good effect in many, though not in all cases. The derivation of the word "borrow" suggests the additional idea of a *pledge* or *surety*. If money is lent, there is generally a pledge to return, with *interest*; and, in addition, there is often, especially in these days, some specified security. Why should not other kinds of property be loaned on some condition of pay, guaranteed by trustworthy understanding? Ought not an honest borrower to return something more than he has borrowed? Would it not be a great relief if every one would adopt such a rule?

Of course we do not purpose to render any one uncharitable or ungenerous. The really needy should be helped, as far as practicable, not only as a duty, but as a privilege; but those who *sponge* upon their neighbors ought to be made to pay for their unjustifiable habit.

"FLORIDA ALLIGATOR TREE."

THE noses of Eucalyptus globulus and of other Eucalypti are out of joint! It has been discovered within the past ten days that the "Florida Alligator Tree" will not only destroy malaria, but that branches or even twigs, if kept in the rooms of our dwellings, will prevent all sorts of diseases whatsoever. No wonder then that of late, hundreds, in fact thousands, of happy men, and ladies and children might have been seen passing to and fro the streets of great New York with a branch of the "Alligator Tree" in their hands. On almost every block bundles of these have been offered for sale at five or ten cents for each branch—"take your pick." "The great Alligator Tree of Florida, Sir. It will cure anything, Sir. You have only to put one of these branches in your room. It will exude a sweet, balsamic odor which purifies the atmosphere and bids defiance to disease!"

In the moist, delightful woods of hill or valley of the Northern States running westward to Illinois and southward, may be found the Sweet Gum. Its leaves are like those of the Maple except that in the Fall they change to a deep purple, sometimes beautifully mixed with orange. When bruised, the leaves emit an aromatic odor at all times; but in the spring, just after they are unfolded, and especially after a shower the air is redolent "with their refreshing ordor." The gray bark, especially upon later growth, is curious for its corky ridges that sometimes form corrugated plates an inch in width. Its botanical name is Liquidambar Styraciflua. Millions of trees may be found within fifteen miles of New Jersey. But how could our city people be expected to know that! When *they* go to the woods they are too enraptured over everything to notice anything in particular!

When, therefore twigs of Liquidambar Styraciflua are offered to them in the streets of New York as the "Florida Alligator Tree," and they are assured of their wonderful powers, is it not quite natural that they should buy a twig or so for ten cents each and hasten on to their homes with a lighter step?

Springs of 1874 and 1875 Compared with this Spring.—We have just been comparing this spring with those of '74 and '75. April 15th, 1874 was the first bloom of Roman Hyacinths in the Rural Grounds. On the morning of the 13th the thermometer fell to 16° above zero. On the 26th, Japan Quinces were not in bloom. On May 4th, we find a note "Country-like winter." On the 9th Hyacinths in perfection. Now (April 15) Hyacinths are in perfection. Japan Quinces are in bloom. In the spring of 1874, May 10, Forsythia viridissima was in bloom. It is in bloom now. On the 16th of April 1875, the ground was so frozen that we failed in an attempt to transplant Hemlocks. On the 29th of April, "a severe frost." May 1st "Willows budding." May 5th, "Sharp frost—ice formed in low places." May 7th, "General appearance of the country is nearly that of winter." Without giving further particulars we find that the verdure of the present spring is as far advanced as it was on May 9th of 1874, and May 12th of 1875. Sad misgivings that the fruit buds, many kinds of which are almost ready to break, will be destroyed, in this section at least, may reasonably be entertained.

BREVITIES.

APRIL.

SWEET April!—many a thought
Is wedded unto thee, as hearts are wed;
Nor shall they fail, till, to its autumn brought,
Life's golden fruit is shed.—*Longfellow.*

COL. REWER of Ithaca, N. Y., thinks a farmer can hardly afford to purchase fertilizers unless he can't raise clover. He keeps his land in good condition with clover alone.

PROFESSOR ARNOLD states in the N. Y. Tribune that those who could not make good butter or cheese last year will hardly be able to do much better this. Unskillful hands cannot be made skillful in a minute, in a month or in a year, though overwhelmed with advice. To make good butter and cheese, like good penmanship and good music, requires long-contined, patient, intelligent and unremitting observation, and practice.

As religious hypocrites darken for the moment the pure luster of true religion, so do humbug scientists throw discredit upon true science. We do not believe farmers despise scientific agriculture because it has done no good but for the harm that has been done in its name. No other medium has equaled the agricultural press as a disseminator of worthless so-called scientific metods of agriculture and, to be candid, we do not wonder that thousands of farmers over the country believe that if they permitted themselves to be guided by the teachings of agricultural papers, it would end in their ruin; and so it would if their own experience did not enable them to sift out the particles of gold from the mass of dross.

In a list of the average duration of the germinative power of some seeds, the London Garden, among others, mentions the following, which at this season may be of service to the reader:

	Years.		Years.
Artichokes	5	Potato	3
Turnips	5	Carrot	4
Balsam	many	Spinach	5
Basil	6	Cucumber	5
Broad Beans	6	Egg Plant	7
Radish	5	Endive	9
Kidney	3	Tomato	5
Rhubarb	3	Leek	2
Beets	5	Lettuce	5
Salsify	3	Melon	5
Cabbage	5	Onion	2
Parsnip	3	Parsley	3
Peas	4		

WE see that several persons have been induced to buy the Dioscorea batatas (Chinese Yam) disguised under the familiar name of "Cinnamon Vine" by the unprincipled vendors. Unprincipled because they deceive and steal at once Deceive in misrepresenting the article which they offer for sale. Steal in appropriating money without returning an equivalent. Both offenses are the meaner because there is no law to punish them. Such acts on the part of a few sneak-thief seed or plant dealers throw unjust discredit upon the entire honorable fraternity of seedsmen and nurserymen. In the instances to which we refer, three dollars have been charged for single roots or bulblets a fair price for which would have been twenty-five cents.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

WOMEN AND WINE.

L. C.

Pop! went the gay cork flying,
Sparkled the gay champagne,
By the light of the day that was dying,
He filled up their goblets again.
Let the last best toast be woman,
"Woman, dear woman," said he,
"Empty your glass, my darling,
When you drink to your sex with me."

But she caught his strong brown fingers,
And held them tight as in fear,
And through the gathering twilight
Her fond voice fell on his ear:
"Nay ere you drink, I implore you,
By all that you hold divine,
Pledge woman in tear drops,
Rather by far than in wine.

"By woes of the drunkard's mother,
By the children that begged for bread,
By the face of her whose beloved one
Looks on the wine when 'tis red.
By the kisses changed to curses,
By the tears more bitter than brine,
By many a fond heart broken,
Pledge no woman in wine.

"What has wine brought to woman?
Nothing but tears and pain,
It has torn from her heart her lover
And proven her prayers in vain;
And her household gods all scattered,
Lie tangled up in the vine;
Oh! I prithee pledge no woman
In the curse of so many—WINE."

SPRING FASHIONS.

THAT "Spring, gentle Spring," is once again in our midst is a fact which will be brought home to the consciousness of the average man with terrible earnestness, when the returns for spring shopping begin to stare him in the face. It is to be feared that his enthusiasm about the coming of the "gladsome season" will be somewhat damped by the contemplation of charges for the items which go to make up the Easter costume. But surely, when the partner of his life appears radiant with the "items" properly arranged and adjusted, he must be a churl indeed who would regret paying a pecuniary tribute for a "beauty of the season." At all events, he must count himself fortunate if the "partner" is able to resist the temptation to lay in a heavy stock of goods, for the fabrics are all so bewilderingly pretty, and a choice is so hard, that self-denying indeed is the woman who can content herself with one dress pattern.

Stripes are prevalent in some of the new wool and silk materials. The stripes are of various widths, plain and shaded, Bayadere and longitudinal. A line of camel's hair materials, twilled with quite a nap and soft and pleasant to the touch, in light *beige* and mode tints, are likely to be much used for early spring and traveling costumes. Indian cashmere for wrappers; light and dark poplins and the new Knickerbocker compositions, in silver-gray, maize, *ecru*, cream and green shades, are among the new and popular lines of goods. There are new designs in grenadines and silks, and what with organdies, lace bourettes, prints, percales and cambrics, there is no lack of material from which to choose.

Colored torchon laces form a pretty finish for lawn dresses. Hamburg embroidery will be popular for piques, cambrics, brilliants and percales. The colored embroideries will be very much in vogue for lawn and thin pique dresses. *Clair de lune* is seen in a multitude of types and will be very fashionable. Silk passementerie is arranged in Vandykes, and covered with pear-shaped Milan balls: around the bottom of the pointed passementerie is attached a short row of short full tassels made of the flat grass fringe. A new garniture is bands of Malines or net embroidered handsomely with graceful vines and blossoms. This style of trimming is applied to silk dresses in an artistic way for evening or dinner costumes. Jet beads are very extensively used on fringe, lace and passementerie.

6170 6170

The only new departure in lingerie are the outside lace, cuffs and deep collars. They are made up in a variety of ways and materials. Pretty sets for morning wear may be made of colored embroideries, crocheted lace, Duchesse point, *applique*, Russian, Smyrna and Valenciennes laces are made up into sets of this kind. Kid gloves will give way a little later in the season to mitts, which come in black, white and all the delicate shades of street and evening wear. They extend half way to the elbow and are elaborately embroidered. Lisle thread gloves are shown with long mitt-wrists of open work.

DESCRIPTION OF CUTS.

AT Fig. 1 (No. 6187, price 30 cents,) we give model of basque and skirt suitable for prints, cambrics or ginghams. It is easily laundried and offers a change from the regulation wrapper. At 6190 is illustrated a handsome coat with a cut-away front. The jaunty effect of the coat is hightened by the dainty vest. Any of the light spring cloakings or heavy dress fabrics will be found suitable in making this coat and bindings, pipings, or machine stitchings are both appropriate and stylish. The vest may contrast with the coat, or it may be omitted if desirable. Price 30 cents.

No. 6170, misses plaited costume. This garment is easily shaped, and is extremely graceful whether made from cheap or costly material.

FIG. 1.

Lace, ruffles, folds or galoon bands may trim the lower edge of the yoke and the wrists of the sleeves. Very little trimming, however, is necessary, as the plaits and sash are sufficient decorations in themselves. Price 35 cents.

At No. 6193 is shown a box-plaited blouse. It can be made of any of the cotton or woolen dress-goods now in vogue, and on account of its loose yet graceful shape is certain to become popular. A very handsome costume may be obtained by combining this blouse with a kilted skirt. Smyrna lace, Hamburg embroidery, braid, bands of the same, or of a contrasting material, pipings and plaitings will decorate the garment tastefully; any style of skirt and overskirt may be worn with this blouse. Price 25 cents.

The child's costume shown at 6192 may be made of any of the fashionable dress fabrics and trimmed with braids or galoon bands. The vest and belt may be of silk or of the same material in a contrasting color and the cuffs, pocket laps and collar may be faced with same fabric. Narrow Smyrna lace would also form a very pretty decoration for the edges, and if preferred a lace bib may be worn instead of the collar when the garment is intended for a girl. Price 25c.

Childs box-plaited apron 6191, is a dainty little garment, that may be worn as an apron or a dress, the peculiarity of its structure making it available for either purpose. It may be made of cambric, lawn, linen, alpaca or any material usually employed in constructing aprons. Ruffling, Hamburg embroidery, Smyrna lace, tatting or any of the cotton edgings will be found very pretty trimmings for washable fabrics. If the apron is made of white linen, lawn or jaconet a very pleasing effect may be obtained by overlaying the centers of the plaits with insertion and ornamenting the sleeves, and bottom of the apron with ruffles to harmonize. Price 20c.

The new wateau garment, No. 6173, is among the recent provisions for baby's comfort. It is long and may be so warmly constructed as to make long petticoats an unnecessary addition to its out-of-door costume. If a lady would provide one or more of these garments for her tiny infant's use, she would not only find it most convenient and pretty in its first months of existence, but all ready for the time when a shortening of baby's frock and petticoats becomes necessary. This gown is very convenient to slip upon the baby when its toilette is unmade, or when it lacks freshness of apparel and must be exhibited. It may be constructed of cashmere, merino, flannel, cambric, or lawn.

Fig. 2 illustrates a girl's costume in Princess form. The principal part of the dress is made of striped goods, and a very pretty effect therefore results from cutting the back bias, and so that the stripes meet in a point at the center or closing edges. Either cambric or woolen goods are suitable for making it up. Price 30 cents. The hat is in sailor style, trimmed with a band, a bow and ends of gros grain ribbon. Any of the patterns described will be supplied at RURAL NEW-YORKER Office, at prices given.

Literary Miscellany.

CORA.

CHAPTER XI.

GEORGE LEESON was taking his leave with tears in his eyes, but Harold was calm and cheerful.

"My mother will be here in a few days," said Sir Alan, as he took his usual seat by the bed-side. "I saw her in London, and thought she might be of use to your sister. She was not able to travel as fast as we did."

"I can't thank you, old fellow," said Harold, smiling. "I don't think you will let Cora miss me much."

Sir Alan flushed slightly, and there was a pause.

Harold, looking away into the distance, saw the lingering sun-rays turning the windows of an adjoining house into molten gold.

"My last sunset!" he said. "Dr. Crosby does not think I shall suffer much at the last. If I do, Alan, stay with me yourself, but send Cora away."

"Yes, old fellow," was the quiet reply.

Then Cora came softly in; Alan gave her his place, and she laid her cheek upon her brother's hand, caressing it in silence.

"Read to me, Alan," said the young artist, in a few minutes.

And the baronet read in his deep, manly voice, the sacred words which brought strength and comfort for that passage through the dark valley which Harold was so soon to take.

The light had faded in the western sky, but the room was not yet in darkness. Marianna had stolen in and knelt by the window, rapidly telling her beads. The reader's soft, grave tones died away, and he closed the book; during the last few lines his vision had been blurred and indistinct, and when the dying man thanked him faintly, he saw that there were tears in the baronet's eyes. There was a silence then, only the rapid murmurings of the old Italian woman broke upon the silence, when Cora, whose eyes were fixed on Harold's face, uttered a faint cry.

"Raise me," he said, faintly, and Alan supported him in his arms, while the beautiful golden head sank back against his shoulder, and the blue eyes closed heavily.

"Harold, oh! my brother, speak to me just once again!" broke from Cora's white lips; and the dying hands moved feebly, and touched her bowed head.

Then the heavy lids were raised for one last look of love at his sister's face, one last glance of recognition turned to his friend.

"Remember!" came feebly from the parted lips, his head fell heavily back on Alan's supporting arm, his eyes closed, a faint, long-drawn sigh, and Harold Sinclair was dead; the blameless, beautiful life had ended, as the physician had predicted, without suffering or struggle.

Very tenderly and reverently Alan Vincent laid the inanimate form back upon the pillows, and then, moved with an almost womanly tenderness, he stooped, and touched the cold brow with his bearded lips.

Two days after Harold Sinclair's death Lady Vincent arrived at Rome.

"How can I thank you, dear mother?" the baronet said, as he met her at the station. "I knew you would come, and we have wanted you sadly. The poor child is in such terrible distress."

6190 6190

"And my son is looking worn and ill," said Lady Vincent, as they drove through the streets.

Sir Alan smiled sadly.

"It rests me to see you, mother," he answered, quietly.

Lady Vincent was a tall, stately woman, of queenly presence, with silver hair, and calm, restful, blue eyes. She resembled her son in the stately presence, and quiet, high-bred manners;

6191 6191

but while Sir Alan was hot-tempered, and jealous to a fault, Lady Vincent was calm and quiet in disposition, and most impartial in her judgement.

"I promised that you would be kind to her," continued Sir Alan. "She has no relation in the word, and she will be like a daughter to you, mother, when you know her."

"I will help you to keep your word, Alan," she replied, gently.

And they drove on in silence, while the thought flashed through Lady Vincent's mind that perhaps she might become a real daughter to her some day.

Marianna received Lady Vincent with great cordiality, and the lady was pleased with the old woman's courtesy, and felt for her evident grief.

When she had rested a little, she asked for Cora.

"I cannot find her, mother," said the baronet, coming in at the moment. "Perhaps she is in her room. Will you come there now?"

Very quietly they opened the door of the room, where Harold lay in silence.

With quivering lips, Lady Vincent gazed upon the beautiful face, looking like a marble sculptured form as it lay there. Some one—Alan guessed who—had strewn flowers upon the still breast and between the lifeless fingers, where they lingered in their sweet beauty, fading slowly.

"It is a beautiful face, Alan," said Lady Vincent, her eyes filling with great tears. "I do not wonder that you loved him."

Sir Alan did not answer. He had glanced rapidly over the room, and seemed a little anxious at finding it untenanted. His mother stood silent, gently placing some of the flowers, which seemed to have been thrown in a heap at the foot the bed, about the still hands, and on the pulseless heart. Then she moved round, and came to the other side of the bed, and Alan saw her start, and stoop down.

He came quickly round to her side, and saw, lying on the floor beside the bed, a pale, still form, as pale and as still as that upon the bed. It seemed as if Cora, coming in to place her flowers, had failed suddenly, and had fallen there; for the little hands were still full of gathered blossoms—white roses and orange-blossoms.

"Take her into my room, Alan," said his mother, pityingly. "Poor child!"

And as her son bent his head over the pale face, which lay with closed eyes and colorless lips against his shoulder, some transient expression in his face made Lady Vincent recall her supposition of that afternoon, and her wonder whether she had found a daughter indeed.

Cora Sinclair's grief for her brother was very passionate and sincere: she mourned him with bitter tears, refusing to be comforted, and Lady Vincent feared that her sorrow would materially

6192 6192

affect her health. Her ladyship was very kind and patient with her; but Cora seemed more at her ease with Sir Alan than with his mother. Perhaps it was that his gentle manner towards her, his half-serious, half-playful remonstrances reminded her of her brother, for she seemed to regard him with a curious, wistful confidence, half-shy and half-trusting.

But after a few weeks Cora seemed to rally, and Lady Vincent, who was weary of the discomforts of the old palazzo, and longed for her English home, proposed to return there. To her surprise Cora assented with eagerness, and preparations were forthwith commenced for their departure. It seemed as if the girl was animated by some new hope, for she seemed brighter and happier. The color had returned to her cheeks, and light to her eyes, and once or twice she had spoken with a touch of the old wistful playfulness which had been so potent to win any boon from Harold.

Lady Vincent and Sir Alan rejoiced, although the latter seemed to have a regret at what he thought denoted lightness and instability of character. His mother, more experienced and unbiased, saw in it only the elasticity of youth, and was really glad to see the improvement in Cora's health and spirits.

But both were mistaken, it was merely a new hope which had sprung up in the girl's heart, filling it with a happiness which, alas! had no real warrant. A few lines of condolence from Lady Martyn had told her also that Lady Lucie's engagement was broken off, and Cora felt sure that, now he was free to do so, Lord Almane would seek her again honorably and openly. She loved him too passionately not to trust him entirely, and she felt certain now that all would be well. It was this hope which colored her cheeks and brightened her eyes, and though she was happy in it, it saddened her to think that the dear brother who had been so much to her should not know of her happiness.

The night before they left Rome Cora climbed the little hill which led to the cemetery where Harold lay, her hands full of flowers wherewith to decorate his last resting-place. The broken pillar of the Parian marble which formed the monument had been Sir Alan's own work, and most exquisitely had he performed his "labor of love." It was just completed, and Cora, who had not yet seen it, contemplated it with tears of gratitude and delight.

"How good he is," she murmured, softly; and it was with a very softened, tender face that she turned to greet him an hour afterwards when she saw the tall, stalwart form coming towards her, looking grand and imposing as it moved among the quiet graves in the semi-light.

"My mother sent me for you, Cora," he said, gently. "She was afraid of the night air for you"

"Yes, I will come," she answered; then, suddenly turning to him, said: "How can I thank you, Sir Alan? It is so beautiful! It seems to remind me of him!"

His quiet face lighted up.

"I am glad you like it, Cora," he replied, his gray eyes seeking her face with a sudden passion in their depths; but Cora, whose eyes were fixed upon the marble pillar, did not meet his eager glance.

They stood in silence for some minutes, Sir Alan's face had grown very pale, and his lips were quivering under his heavy moustache. Strong man though he was, he was trembling, and could hardly find courage to put the question to this young girl, who held in her hands his future happiness or wretchedness. At length with a long sigh, Cora prepared to go. She rose from her seat on a grassy mound, and, breaking off a rose which was growing beside Harold's grave, bent gently forward, and pressed her lips to the marble in one long, lingering, farewell kiss.

Then, turning to the baronet, she said, quietly:

"I am ready, Sir Alan."

"Stay yet one moment," he exclaimed, in a hoarse voice, putting his hand on her arm to detain her.

Cora looked up in astonishment; but under the passion and ardor of his glance her own fell, and she saw that the strong hand resting on her arm was trembling.

There was a momentary silence, which Sir Alan broke.

"It seems almost absurd," he said, trying to speak lightly, "that one should be such an utter coward. Don't laugh at me Cora. If I were less in earnest, I should find it easier, perhaps, to tell you what I have wanted to tell you for some days past.

He paused.

Cora waited in silence, wondering a little. It may have been that her thoughts were too full of another man to give her a clue to Sir Alan's meaning: but she saw that his agitation was excessive.

"When your brother entrusted you to me," he went on, speaking more calmly, "I hoped to be able to take a brother's place, and replace him as far as possible; but, Cora, that is impossible. I cannot be your brother; I can be nothing to you, unless you can give me a nearer and dearer right to take care of you."

For a moment Cora did not understand his meaning. Then, as it dawned upon her, she grew pale, and trembled exceedingly.

"Child—child," said Sir Alan, his forced calmness giving way, "do you not understand me?—do you not see why I cannot be a brother to you?"

Cora tried to answer him, but her voice failed her; she liked him so well; her brother had loved him, and he was so good to her. The answer she must give him sounded like ingratitude, and she could not force her trembling lips to speak the words which she felt would grieve him so bitterly. She could hear the quick, heavy breathing which told of his great agitation, as he stood beside her, and with a strong effort, a quick prayer for calmness, she bowed her head upon her hands.

FIG. 2.

CHAPTER XII.

"Not Now—Not Ever."

At length Sir Alan spoke, and his voice had lost the suppressed passion of his former tone, as he gently removed the girl's trembling hands from her face.

"I have frightened you, dear child. Forgive me, Cora; I only ask one word from you. I do not wish to hurry or distress you; only tell me whether the boon I ask can ever be mine?—whether now, or ever, you can give me the love I crave?"

"No," said Cora, suddenly mustering all her courage, and with a desperate effort wrenching her hands from his clasp, which, in his earnestness, almost hurt her from its close pressure. "Do not ask me. It cannot be; not now—not ever!"

She turned from him as she spoke, grieved to her inmost soul by the expression of terrible pain she read upon his face; and, choking back her sobs as she went, she walked rapidly homewards, and then, in the solitude of her own room, sorrowed for his disappointment with a keen sorrow.

"I should have so liked to repay his goodness," she sobbed; "but how could I, loving Stanley, and knowing that he is free?"

When Sir Alan returned to the palazzo it was nearly midnight, and Lady Vincent, who was waiting for him, looked up anxiously on his entrance.

"Would you mind much if I let you go back to town alone, mother?" he said, quietly. "It seems a pity to leave my work here yet a-while."

"Not if you think it wiser to stay, Alan," she answered, kindly, reading the suffering on his face, but too wise to remark upon it. "We shall have Charles with us, and no courier can surpass him, you know."

Alan acquiesced; but as he sat, resting his head on his hand wearily, the light from a lamp on the table fell full on his face, and Lady Vincent felt her eyes fill as she marked his haggard, worn look. She rose from her seat, and, coming to his side, passed her arm round his neck, and rested her cheek against his brow. He tried to smile as he returned the caress.

"Is it really better for you to stay, my son?" she said, tenderly.

"Yes, mother," came the low reply; and Lady Vincent desisted from all entreaty; but she sighed as she bent over him to say "Good-night."

He detained her gently, lifting the frank, mournful gray eyes to hers.

"Mother, you will be good to her," he said, quietly; "for *my* sake?"

"Yes, dear Alan."

No other word was spoken between them; but Lady Vincent knew that her son loved Cora Sinclair, and that his love was not returned.

Cora returned to England with mingled feelings, seeming years older than when she had left it, sorrowing for her brother, full of hope of a near meeting with Viscount Almane, and yet pursued persistently by the remembrance of Alan Vincent's grave, handsome face and unfailing kindness. It vexed her sometimes to find how much she thought of him, but while she looked upon it almost as disloyalty to Lord Almane, she could not fail to do so when every day, every hour as it passed, gave her some fresh proof of his thoughtful kindness.

Very soon she was quite at home at the quaint, old-fashioned house where Lady Vincent lived, and which, while it was replete with comfort, had no luxury nor grandeur about it. The servants were few in number, but old and tried, and soon Cora was initiated into the ins-and-outs of the quiet household.

Alan's father, the first baronet, had been a distinguished officer, and had received the baronetcy in return for the services rendered to his country; but he had not been a rich man, and Lady Vincent's jointure was but a small one to support her position. Sir Alan also was one of the poorest baronets in the United Kingdom—a fact which troubled him little. His mother's prayers had alone prevented him from adopting his father's profession, but in the one he had chosen—for he had taken to his art with as much enthusiasm and industry as if he had to earn his living thereby—he bid fair to win both fame and fortune.

For the first few weeks at The Bungalow—for so Sir Paul Vincent had named his house—Cora was almost entirely happy. Lady Vincent's gentle kindness, the favor with which the servants—who pitied the fair young girl in deep mourning—received her, the air of refinement and peace over the house pleased her, and above all she had the hope of soon meeting Lord Almane. Social distinctions and differences of position never entered Cora's innocent head; she believed firmly that now that he was free nothing could hinder the Viscount from openly declaring his love and making her his wife; and Marianna could not fail to notice that there was a kind of repressed exultation about her young mistress. The Bungalow was about ten miles distant from London, and from some of Lady Vincent's visitors she heard chance mention of Lady Martyn and her niece; and once she heard that Lord Almane was in town.

One day came a note for Cora from Lady Martyn, apologizing that her ill-health prevented her from calling on Lady Vincent, and asking Miss Sinclair to spend a few days with her in London. The next morning she sent her carriage and maid for Cora, and the young girl, feeling as if the fulness of her happiness was now indeed come, was carried rapidly to Park Lane.

The old lady received her with all cordiality, petted and made much of her; but it was only on the second day that she mentioned the name Cora was longing to hear.

"Lord Almane called a few minutes ago, my dear," she said, as Cora entered the drawing-room. "He would not allow me to disturb you, but begged I would present his compliments to you."

"Did he know I was here?" said Cora in a low tone, feeling as if she could not have heard aright.

"Yes, I think so; or rather no, for he said when he came in that he would stay to dinner, but when he heard you were here, he said that perhaps you might not care to see chance visitors just now."

Chance visitors! Cora's heart stood still. Could it be that Lord Almane had been only amusing himself at her expense, flirting with her, without any intention of carrying out the words and promises he had spoken to her? Cora loved well, and doubted with difficulty; but it seemed even to her as if he had not acted faithfully towards her.

"I do not think he has got over Lucie's dismissal yet," continued Lady Martyn. "I could never imagine what induced her to break it off; but she was very determined about it."

Cora's thoughts flew back to the time when she was at Mrs. Colston's, the evening of the ball, when Sir Alan had come to fetch her to her brother's death-bed. She remembered the Viscount's passionate words then, and when he had left her, that, looking up, she had met Lady Lucie's blue eyes full of sorrow and reproach.

"Very determined," repeated her ladyship "And yet if ever a woman loved a man she loved Stanley St. Roger. All the family are very sorry for it. Indeed, Lucie's resolution took us all by surprise. I miss her very much, and wish it had not happened. She is away now, living in Paris with the Countess of Chilcot."

When Cora returned to The Bungalow, Marianna, with her quick penetration, immediately saw that a change had passed over the girl, quenching whatever hope had made her eyes so bright and her lips so often part with a happy smile. The old servant was shrewd enough; she soon dis-

covered how matters stood; and knowing Cora's disposition well, she resolved to strike a blow which would cut at the heart of her love for Lord Almane, and destroy it entirely. One evening she was assisting Cora to undress, and was combing out her shining tresses, when she mooted the subject as follows:

"Does the signorina know," she said, quietly, "that the engagement between Lord Almane and his cousin has been broken off?"

"Yes, I know it," said her mistress, reservedly; but Marianna, who was watching the reflection of the fair young face in the mirror, saw that it colored deeply.

"I am glad," said Marianna, sententiously.

"Why?" said the young girl, wonderingly.

"Because Milord Almane is not worthy to have any innocent young girl for his wife."

Cora turned to her in some surprise.

"You are surprised, *signorina mia*; but I am not speaking of what I know nothing. Any man who in return for kindness received could betray him who had been kind to him is unworthy."

Cora made no reply, but her eyes could not meet Marianna's, and she recalled, with a start, Lord Almane's assertion that Marianna knew of their love.

"I am not speaking of what I know nothing," continued the Italian. "You know that he is false and base now, signorina; that when he sought you with his false words of love he meant no good to you—nothing but shame, but disgrace, but dishonor."

"Marianna!" flashed the young girl, proudly.

"But it is true," went on Marianna, coolly. "Said he not these words to me, *donzella mia?* 'Men in my position don't marry any pretty face which crosses their path.' And as he said it he laughed."

"He said that!" broke from Cora's lips; she had risen, and stood facing the old woman, pale with anger, with flashing eyes. "He said that, Marianna?"

"He said that and more, *donzella mia;* and I, poor servant that I am, told him that I would not let him wed you, then, knowing his baseness and his falsehood—that I would rather see you dead."

Marianna's attempt was a successful one. The operation had been most painful; but it succeeded beyond all her hopes. Cora did not speak again; but, watching her face, the old woman saw the storm of contempt, of scorn, of horror which passed over it.

"You are not angry with poor Marianna, my darling?" she whispered, as she bade her good-night; and Cora, raising her hands, drew the old wrinkled face to hers and kissed it warmly.

"Were all the world false, I know you true," she said, softly; and then she broke into a passion of sobs on the old woman's breast.—[To be continued.

FRIENDSHIP AND FLATTERY.

When Friendship first came down to earth.
With heart of generous mold,
And soul of truth and heavenly worth,
'Twas in the age of gold.
She taught the love that came from God
For all humanity;
Sweet Pity in her footsteps trod,
With Faith and Charity.

But Flattery, as the world grew old,
Stole Friendship's honest face;
When Truth's stern accents grew less bold,
And Falsehood taught grimace.
Th' indignant martyr did not wreak
Her vengeance upon men,
Nor soar on refluent wing, to seek
Her home in heaven again.

She left her rival to reign o'er
The sunny paths of life,
And loved the dark ones to explore
With sad misfortune rife.
Both to their own their aid extend,
Each in her way a mother;
Success still finds the one a friend,
Adversity the other. [*Temple Bar.*

PERE HYACINTHE AS A REFORMER.

There has recently been a rather lively controversy between Rev. D. Prime, the editor of the New York Observer and M. Loyson, formerly known as Pere Hyacinthe. Dr. Prime has attended service at M. Loyson's church in Geneva, and finding that the service consisted of a celebration of the Mass, followed by a sermon on the duties of husbands and wives, he expressed in the columns of his paper the conviction that M. Loyson was still a "papist," and a rather unusually undesirable one at that. This hurt the ex-priest's feelings, and accordingly he wrote a letter to the effect that Dr. Prime was a liar and a slanderer, who had wantonly tried to injure a Christian brother. Whereupon Dr. Prime not only demonstrated the truth of his original statement, but added that M. Loyson's sermon on matrimonial duties was simply disgusting. Time has since been called, but M. Loyson has failed to resume the controversy feeling doubtless that it is safer to forgive his antagonist than to provoke him to further remarks.

The career of M. Loyson has been a remarkable one, not in itself considered, but in its success in awakening the interests and sympathies of Protestants. Pere Hyacinthe was at one time the most popular preacher in Paris, and his sermons were regarded as masterpieces of eloquence by the ladies who constituted nine-tenths of his hearers. One day he suddenly renounced his monastic vows, and soon after married an American widow lady, and, removing to Geneva, set up an independent church of his own. Of course the Roman Catholic Church promptly excommunicated him, and, equally of course, ardent Protestants were ready to look upon his defection from the Roman Church as a triumph of Protestanism.

The impression both among European and American Protestants that on leaving the Roman Church M. Loyson thereby became a Protestant, and, as such, was entitled to the utmost sympathy and admiration, was very general. Everywhere the Protestant press spoke of him as a noble reformer, an improved variety of Luther, and a modern Calvin, who was too gentle and merciful to even scorch a steak. Nevertheless, M. Loyson showed no disposition to connect himself with any recognized church or sect. He complacently received the praises of Protestants, but he never accepted any of their distinctive doctrines. Even the Old Catholics, who recognized the leadership of Dr. Dollinger, failed to gain M. Loyson; or, rather, he refused to adopt their creed and practice. When he finally took possession of a church edifice at Geneva, and gathered a small congregation about him, he still maintained his independence, and thus added to the religious bodies of the world an entirely new church, of which he was the sole heirarchy.

The new church was founded upon the great and precious doctrine that it was the right and duty of Mr. Loyson to become a married man. To this leading doctrine was added, as a minor article of faith, a denial of papal infallibility. These two articles constituted the only doctrinal difference between the Church of Mr. Loyson and the Church of Rome. Mr. Loyson believed, and still belives, in the intercession of the saints, the duty of confession, the power of the priest to forgive sins, the doctrine of purgatory, and every one of the distinctive doctrines of the Roman Church, with the two exceptions of the celibacy of the clergy and the infallibility of the pope.

Why this man should have been called a reformer and looked upon as virtually a Protestant when he was simply a Roman Catholic who had been excommunicated for breaking his monastic vow, is a mystery. Nevertheless, until Dr. Prime had the frankness to speak the truth concerning M. Loyson, American Protestants regarded him as an evangelical Protestant, as a pillar of Protestant faith, and an ornament to the city of Calvin. It was full time that this error should be pointed out, and M. Loyson's true position as a religious teacher defined; and Dr. Prime has really done a public service in exploding the popular Loyson myth.—*N. Y. Times*

CHINESE MAXIMS AND PROVERBS.

Great souls have will; others only feeble wishes.

Attention to small things is the economy of virtue.

Who is the greatest liar? He who speaks most of himself.

Men may bend to virtue, but virtue cannot bend to men.

One forgives everything to him who forgives himself nothing.

RECENT LITERATURE.

"The Simple Truth."—A Home Book. By Robt. Colyer, Minister of Unity Church, Chicago, Boston: Lee & Shepard.

This is a collection of some ten essays on every-day topics, which appeal to readers of all classes. The first one "Growing Aged Together," contains some exquisite allusions to marriage and to the beauty and holiness of a sincere and pure affection. To be fully appreciated, the essay must be read entire, but we are tempted to give the following extract in which love is most beautifully defined. "For true love grows out of reverence and deference, loyalty and courtesy, good service given and taken, dark days and bright days, sorrow and joy. It is the fine essence of all we are *together*, of all we do."

Of the other "home sermons" "Softly." "The Burden of an old Song," "Referring Back" "Wild Lilies" and "The Parable of the Prodigal Son" will especially commend themselves to readers for the tenderly beautiful sentiment which underlies them. The author pleads very earnestly for the children. "They are tender, I will lead them gently." All through the volume there breathes a spirit of love and tender kindness for the little ones.

The public generally will find much to admire, and profit by in this little volume but to parents especially it will be peculiarly valuable. The application of the principles which it advances would make many a home happier and better.

The Commonwealth Reconstructed.—By Chas. C. P. Clark, M. D. Price $1.50. New York: A. S. Barnes & Co.

The author goes outside of his profession to give us a very able work of some 200 pages on the political economy of our government since the close of the war, the corruption in high places and the use of official position to promote personal aims. So much has been said and written on these subjects that it could scarcely be expected of Dr. Clark to make any startling revelations in his book, but there is much not heretofore suggested which will furnish food for reflection. Referring to the possible charge of partiality and exaggeration, he says: "I shall admit the justice of the criticism but only in the sense that the redeeming features of the situation are not equally presented with the condemnatory. But to do that did not belong to the purpose I had in view in that description, which was to show that the condition of our political affairs is too shameful and calamitous to be willingly submitted to by an intelligent and virtuous people." It will be seen that Dr. Clark takes rather a dismal view of our political system, the defects of which he says "cannot be justly laid to either the Republican or the Democratic party" but to the short-sighted and narrow-minded policy which dictated the construction of our State Constitutions and to our system of elections. Remedies are suggested which are more or less practicable but the interest of the disquisition is in the comparatively new light in which the subject is presented and the original and lucid manner in which it is treated.

The Story of Elizabeth. By Miss Thackeray. (Cloth, $1.00.) Philadelphia: T. B. Peterson & Bros.

Miss Thackeray's reputation as a novelist is sufficiently well-established to render superfluous the *quasi* introduction given in the title page as "the daughter of Wm. M. Thackeray, etc." Indeed, there is something in her succinct and graceful descriptions, keen and discriminating powers of observation and fine perception and delineation of character which, at times, forcibly recall the great author of Vanity Fair. The "Story of Elizabeth" is an exquisite little story, full of tenderness and delicacy and written in Miss Thackeray's best manner.

From Hand to Mouth. By Amanda Douglas (Cloth, $1.50.) Boston: Lee & Shepard.

This is as dreary a story as its title augurs, and it drags its slow length along through a tedious monotony of vapid incidents and insignificant details which weary out any interest or curiosity the reader may at first have felt in the characters, long before he learns their final destinies. There is no plot to speak of, and whatever of literary merit there may be in the work is obscured by the lack of purity and refinement of the style and diction. The book will detract from rather than add to the reputation of the author.

A Manual of Nursing. Prepared for the Training School for Nurses attached to Bellevue Hospital. New York: G. P. Putnam's Sons.

This is a valuable little work and one which should find its way into every house. No technical terms are employed: the language used is simple and the directions explicit. The chapters on Emergencies, Monthly Nursing, Nursing of Sick Children, Hygiene of Children and Cookery for the Sick, will be of incalculable value to mothers, whilst those who desire to adopt nursing as a profession will find the book replete with information especially adapted to their requirements.

Mother Goose Masquerade. A Delightful Evening's Entertainment, with explicit Practical Instructions for carrying out a successful Programme. Boston: Lee & Shepard.

Here's a fountain of inspiration for those who are interested in amusing the little folks or in getting up entertainments and who are in quest of something novel.

"Mother Goose Masquerades" have become very popular, and yielding to the solicitations of many correspondents, the author of this book has given full directions for the management of a "Masquerade."

The Historical Student's Manual. By Alfred Waites. (Cloth, 75 cts.) Boston: Lee & Shepard.

The publishers announce that the "purpose of this Manual is to show at a glance the duration of the reigns of all the English monarchs, and of those of their contemporaries of France, Germany and the Papacy, from the invasion of William the Conqueror to the present time, with the principal events of celebrated persons." It is the best work of the kind we have ever seen, and no student of history can afford to be without it.

The Accountant. For Public Schools and Academies. By M. R. Powers, M. A. [155 pages; price $1.25.] New York: A. S. Barnes & Co.

This is a full and practical treatise on book-keeping and commercial transactions generally. The lucid manner in which the author defines commercial terms and the fullness with which methods of keeping accounts are illustrated make the work invaluable as a text-book.

The Image of Her Mother, a novel by Ruth Rustic, a lady of Savannah, will be commenced as a serial in the News of that city. The News is a clever journal, and the story no doubt will prove attractive.

The Home-made Bonnet.—One of the most sparkling and clever literary achievements we have seen recently, is a narrative play entitled "The Home-made Bonnet" by Mr. Roland Waters, which has been published in the "*Every Saturday*" of Baltimore. We learn with satisfaction that it is soon to be published in book form and at a price which will put it within the reach of every reader who appreciates genuine literary talent.

The Home-made Bonnet is admirably written, and is constructed in the style of Mr. Wm. D. Howell's "Parlor Car" which has met with such unbounded popularity. It is a one-act comedietta replete with fun and comical situations, while there runs throughout a vein of good-natured satire on fashion's follies of to-day. The characters are irresistibly interesting and the "stage business" is ingenious and sustained with *verve*. This little work will prove an invaluable addition to the resources of the amateur and the parlor play actor, for whom it is peculiarly adapted, besides being a brilliant and charming little story, and a pleasing departure form the stereotyped style of current fiction. It is to be hoped that Mr. Waters, who does not write like a novice, by the way, will undertake a series of such piquant productions, if he has not already done so and that the "Bonnet" will not long be without a companion.

BRIC-A-BRAC.

MARK TWAIN'S HOTEL.

Having lately opened a hashery, I send you these, my rules and regulations:

This house will be considered strictly temperate. None but the brave deserve the fare.

Persons owing bills for board will be bored for bills.

Boarders who do not wish to pay in advance, are requested to advance and pay.

Boarders are expected to wait on the colored cook—for meals.

Sheets will be nightly changed, once in six months or more, if necessary.

Boarders are requested to pull off their boots if they can conveniently do so.

All moneys and other valuables are to be left in charge of the proprietor. This is insisted upon, as he will be held responsible for no losses.

Single men with their families will not be boarded.

Dreams will be charged by the dozen.

Nightmares hired out at reasonable rates.

Stone vaults will be furnished to snoring boarders.

Prince Bismarck was once asked by Count Enzenberg, formerly Hessian envoy at Paris, to write something in his album. The page on which he had to write contained the autographs of Guizot and Thiers. The former had written, "I have learnt in my long life two rules of prudence. The first is to forgive much; the second is never to forget." Under this M. Thiers had said, "A little forgetting would not detract from the sincerity of the forgiveness." Prince Bismarck added, "As for me, I have learnt to forget much and ask to be forgiven much."

A LOVE TOKEN.

Do you grieve no costly offering
To the lady you can make?
One there is, and gifts less worthy
Queens have stooped to take.

Hold a heart of virgin silver,
Fashion it with heavy blows,
Cast it into love's hot furnace,
When it fiercest glows.

With pain's sharpest point transfix it,
And then carve, in letters fair,
Tender dreams and quaint devices,
Fancies sweet and rare.

Set within it Hope's blue sapphire,
Many-changing opal fears,
Blood-red ruby stones of daring,
Mixed with pearly tears.

And when you have wrought and labored
'Till the gift is all complete,
You may humbly lay the offering
At the lady's feet.

Should her mood perchance be gracious,
With disdainful, smiling pride,
She will place it with the trinkets
Glittering at her side.

Sarah Bernhardt, the French actress, has industry enough for three women. In the morning she takes a long ride in the saddle; at noon she turns sculptor, and works on three or four busts, which she is going to send to the exhibition; then she goes with her chisel to her group of "Medea." At two o'clock she takes up the brush and works on a large painting; at nightfall she is writing her memoirs, or rehearsing her *roles*, or attending her correspondence. In the evening she appears on the stage.

I wish young women could be taught that it does not add a cubit to the stature of a house to call it a "residence"; that a church or even a meeting house is as venerable as the "sacred edifice"; that it is no more genteel to say "retire" than to go to bed; that the garment so fondly, slowly covered with side plaitings, so coldly and quickly frayed out along the paving stones, is really a gown and not a "promonade costume"; that it need not bring a blush to the cheek of even Mr. Podsnap's young person to say leg instead of "limb," when leg is meant; that the supper at an evening party is not "the entertainment"; and that there are well-founded objections to the use of "nicely" as an adjective describing the state of one's health. "To clothe low creeping matter with fine language," said old Fuller, "is not fine fancy, but flat foolery." It rather loads than raises a wren to fasten the feathers of an ostrich to her wings.—*Mrs. C. Runkle.*

A little child might well confound,
With almost perfect ease,
The wisest man, though quite profound,
By questions such as these:

First tell across what river lies
That famous work, the Bridge of Sighs?

Then answer, the hardest of things,
From whence descends the reign of kings?

Pray give the weight, and from what stack,
"The straw that broke the camel's back?"

How large a broom ought there to be
To sweep a storm across the sea?

Now name the tree, and tell how high,
That bore "the apple of the eye?"

Who has ever wished or sought
To ride upon a train of thought?

Upon what sea and at what rate
Sails that proud, haughty Ship of State?

Upon whose tender face appears
Wrapped this weary vale of tears?

To what ocean and through what clime
Flows that non-ending river, Time?
[*Cincinnati Commercial.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

CHINA AND GLASS-WARE.

PLEASE give me some idea as to the kinds of china and glass-ware now in use; also as to price of dinner and tea sets. INQUIRER.

IN answer to "Inquirer," a few notes taken during an hour's stroll through the various departments of a large emporium of china, glass-ware, etc., may give her an inkling of what she wishes to know.

Fashion is as changeable in china and glass-ware as in ladies' apparel, and that worshiped goddess decrees that a fashionable dinner service of to-day is made up of twelve different colors, or rather tints. That is, each plate, cup, etc., is decorated with a differently tinted band, an inch or so in width, of blue, green, gray, lavender, and so on. To these sets, made up of many colors, the name of "Harlequin" is given.

Indeed, the demand for decorated china for table use has been so great that manufacturers have been obliged to produce it in inferior wares to supply the popular trade.

In dinner sets we noticed a novelty called the "Crane set." The ware is known as Cooplen's ivory, frangible, of a greenish yellowish cast, decorated with rather light green cranes and straggling, palmately-divided leaves on long petioles. In this set 125 pieces; price $90.

Very pretty dinner sets, first quality of French china, banded in any or every shade, with a gilt line either side of the band, were shown for $35; 102 pieces in the set. For the band the lighter shades of blue, gray and lavender are those most sought for. Tea sets matching this set, $10.50 for 56 pieces.

It is relief for the eye as it rests upon the pretty blue and white English printed ware, similar to the china of a hundred years ago. The neatest was a pattern of light blue grape leaves and fruit for the border, with roses and buds in the center. 175 pieces in these sets; price from $35 to $50.

There is a revival of an old English ware called "Old Spode." Of a light cream color and recommendable for its lightness, combined with durability. A Grecian pattern of red on a black ground was among those we admired. These sets were $65; 176 pieces.

For common usage the best English ware, plain white, imitation of china—and a very good imitation too—is preferred by many. A dinner set, consisting of 12 dinner plates, 12 tea plates, 12 soup plates, 3 meat dishes, 2 covered dishes, 2 vegetable dishes, 1 soup tureen, 1 sauce boat, 1 pickle dish, 12 coffee cups and saucers, 12 sauce plates and 12 butters, can be purchased as low as $15. Tea sets, same quality, 35 pieces, $4.75.

In shape cups, whether decorated or plain, are low, small at the bottom, wide at the top known as "egg shape." In pitchers, the fancy for the moment, is the straight, the "Tankard."

Novel butters were shown, each representing a variegated pelargonium leaf, with the name on the underside, as "Happy Thought," "Md. Pollock." They are of china, decorated by hand, about 3½ inches in diameter, and $10 a dozen. Other pretty butters are offered for $1.25 a dozen, imitating grape and other leaves, not *hand* decorated, true; still pretty.

Little dishes for scolloped oysters, in imitation of the half-shell of an oyster, of French unglazed porcelain, and hand decorated with charming little sea views, 90 cents apiece.

Beautiful fruit desert plates, each decorated with a different fruit. The apples, grapes, and peaches looking as tempting as the fruit itself. $6.50 a dozen.

Salt shakers are used to the entire exclusion of the individual cellars. They come in cut and pressed glass, silver plated caps. $1.50 and upward a dozen.

In glass-ware the "Iridescent" is the newest. It is a Bohemian glass, delicate, fragil, reflecting every color of the rainbow, reminding one of a soap-bubble just before it bursts, only more clear and brilliant if that be possible. In cut-glass goblets the fancy is for uniformity of shape in the set—a short stem and a gradual increase upward to about three inch diameter—but each glass is differently decorated with grasses, ferns, lily-of-the-valley, or all ferns but different species; these last are very delicate. Price ranging from $10 to $14 a dozen. Pretty pressed glass goblets can be purchased for $2 a dozen. The price for engraving an initial and wreath on either cut or pressed is $1.50 for the dozen.

OVINGTON BROTHERS, Brooklyn, please accept thanks for information.

ATTICS AND CELLARS.

IT is a good plan for a housekeeper to make a weekly visit to every part of her dwelling from "garret to cellar." The attic is often the repository of articles of little value, such as worn-out garments, bedding etc. If such articles must be kept they can be neatly packed in drawers or boxes, wrapping woolens of any value in linen or thick brown paper to protect them from moths. Attics and cellars should be so arranged that they can be perfectly ventilated. To some persons the thought of visiting the cellar is anything but pleasant, because the name is associated with darkness, noxious vapors, dampness, small dingy windows, walls and floors which are rarely swept, boxes, barrels etc. in disorder. We have seen just such cellars, but we know of one more cheerful than many parlors. It is light and airy, and in the south windows plants thrive during the winter months, their bright green foliage showing how well adapted the cool atmosphere of the cellar combined with freedom from dust is to their needs. A weekly visit to their cellar answers during the winter, but as spring comes upon us this part of our house requires closer attention.

Vegetables must be examined, and those showing signs of decay, removed. Apples that are slightly unsound can be made into jelly, and my recipe is as follows: After cutting out the imperfect parts, wash the apples and quarter, without paring or coring. Place in a porcelaine kettle, and to four quarts of cut apples add a little less than one quart of cold water. Cook slowly until soft but not broken. Turn into a jelly bag that has just been wrung out of hot water, and hang up to drain. Strain the juice again to make the jelly clear. Boil ten minutes skim, then add the sugar, one pound to a pint of juice, and boil twenty minutes. If the apples are not sour, the jelly will seem thin, but in a few days will be solid, and of a fine amber color.

Lyons, Iowa. M. G. R.

DOMESTIC RECIPES.

Pine-apple and Tapioca Pudding.

Soak a teacupful of tapioca in a pint of water for two or three hours; then add one quart of milk; two beaten eggs; two-thirds of a cup of sugar; a little salt and a tablespoonful of butter; bake in a buttered dish, stirring occasionally at first. When done it must be quite stiff, turn on to a platter and pour over a pint of canned pine-apple, or uncooked pine-apple, previously cut into little dice, sprinkled with sugar and covered tightly for an hour or so before using.

Preserved Pine-apple.

Make a sirup of three-quarters of a pound of sugar and not quite one-half pint of water to each pound of fruit; put over the fire in a porcelain kettle, and just before it boils stir in the beaten white of an egg with a tablespoonful of cold water; as it boils remove the scum until no more rises. Have the pine-apple peeled and sliced or cut into dice; add to the sirup and boil gently until the sirup has penetrated the fruit and the pieces look clear. Put into cans and seal.

Pine-apple Pudding.

Sliced pine-apple substituted for the oranges in Mrs. D. SNEDIKER'S recipe for "Orange Pudding" in the RURAL of January 19, makes a very palatable dessert—serve as cold as possible.

News of the Week.

TWEED'S DEATH.

"THE evil that men do lives after them,
The good is oft interred with their bones."

So it is with Wm. M. Tweed, the ex-Tammany Boss, the maker and unmaker of political fortunes, the monumental public plunderer of the nineteenth century, who on the twelfth instant ended miserably in prison an eventful life of fifty-five years. His frequent acts of individual kindness, his staunch adherence to his friends and partisans, his ostentatious liberality with the funds of which he was plundering the public treasury, will be soon forgotten, even by most of those who were benefited by them, but the load of taxation his monstrous dishonesty and that of his confederates has piled on his fellow-citizens, the evils of their example and the official corruption they sedulously fostered, will in their baleful effects long outlive the remembrance of the dead swindler's impulsive benefactions. The sudden death of this notorious malefactor has excited a passing feeling of sympathy in many bosoms that execrated his crimes, but it should be borne in mind that every year witnesses, in the penal institutions throughout the land, still more lonely and miserable ends of hundreds of gray-haired criminals whose offences were venial in comparison with those of which this dead politician was guilty. It has been urged in his favor that he was no more guilty, while more manly, than his dishonest associates who have hitherto escaped the full punishment deserved by their crimes, but these crimes would have been impossible were it not for his bold and unscrupulous leadership, and in a confederacy of guilt, it is the just practice of society to treat the ringleader only with extreme severity.

NEWS OF THE WEEK.

Ex-Governor Moses of South Carolina has been arrested in this city on a requisition from Gov. Wade Hampton, on a charge of forgery. He insists before the Court here that the forgery was committed on invalid documents and was therefore not of such a criminal nature as to justify his surrender by the New York authorities. The squabble over the election of a Door-keeper for the lower House of Congress has terminated in the election of Gen. Field, whose military title was won on Confederate battle-fields. His opponent, Gen. Shields, who was wounded in the Mexican War and again on the Union side during the late unpleasantness, has been highly complimented by Democrats and Republicans, and the House, by an almost unanimous vote, authorised the President to appoint him a Brigadier-General on the retired list of the Army of the United States, which will give him a permanent pension of upwards of $1,000, if it passes the Senate and President. Both Shields and Field are, of course, staunch Democrats. A bill introduced into the New York Assembly for taxing clergymen and church property was badly defeated. The Republican Senators and Representatives held a joint caucus, at which action hostile to the President was discountenanced. The proposition made in the N. Y. Legislature to inaugurate a system of free canals has been defeated for this term, but is sure to come up again in the next Legislature. A bill is being pressed in the State Legislature, seeking to establish a uniform freight tariff of one cent per quart on all milk transported on railroads which now charge a higher rate and which reach the cities of New York and Brooklyn. Rural legislators should look sharp after this, affecting as it does the interests of their constituents, nor should these be silent on the matter. It has been at length decided to officially recognize Diaz as President of the Mexican Republic, in view of his vigorous measures for suppressing border raiding by patrolling the frontier with reliable regular troops instead of militia, who were little better than the robbers they pretended to suppress. At last, after many disappointments, Fitz John Porter has succeeded in securing an order to have his case reopened, as fresh testimony is reported to have been discovered, going to prove that the court-martial that tried and condemned him was over harsh, at least. There are strong reports of anticipated Indian troubles soon from Sitting Bull and other hostiles. Secretary Sherman has been making a very powerful argument before the Finance Committee in favor of the early resumption of specie payments. As the premium on gold was on Saturday, the 13th instant, only ¼ per cent., the step to that issue is not a great one. Several banks through the country have already resumed by paying in gold their notes presented at the counter; and unless Congress interferes, resumption will soon come in the regular order of business. Clarksville, Tenn. has had a $500,000 fire. A bill has been introduced in the State Legislature by which a saving of about $200,000 a year in the salaries of officials in this city will be accomplished. Now petty police justices get $8,000 a year, and higher judges proportionately, so that many of them—second-rate lawyers at that—draw higher pay than judges of the U. S. Supreme Court, while all officials, with scarcely an exception, are enormously over-paid both for the duties of their offices and their own personal, educational and business standing.

Across the Alantic political affairs are still in great doubt, although the latest advices have a more peaceful tone. England has relaxed the urgency of her warlike prepartions, probably mainly because they are already completed, or nearly so. Bismarck, in whose hands the question of peace or war really rests, seems to be making more active efforts to bring about a spirit of conciliation. Russia heavily burthened with debt, and finding it difficult to borrow money even at enormous sacrifices, seems willing to recede somewhat from her arrogant position with regard to most of the questions involved in the treaty of San Stefano. Advices from Berlin give hope of a meeting of that Congress, provided the Powers consent to the retrocession of Bessarabia and the extension of Russian territory in Asia as far as Erzeroum and a pecuniary indemnity; these modest demands granted, Bismarck will use his best efforts to induce Russia to allow the Congress full power to modify the other territorial changes made by the treaty.

Having secured all his own immediate interests, the Czar is willing that those of his late allies, Bulgaria, Servia and Roumania, shall be passed upon by the tribunal to which he refuses to submit questions affecting Sacred Russia. At present, Russian troops are pouring into Roumania despite the remonstrances of the government of of that State, and in view of their arbitary conduct and their treatment of the natives as a conquered race, the Roumanian government is drawing up a protest to be sent to the Powers. In Constantinople defences are being thrown up towards the Russians, and the Government contemplate moving to Scutari, so that in the event of a conflict, Turkey might not be forced to take sides with either party, through the seizure or capture of the present seat of government. The Russian troops have seized upon the passes of Carpathian Mountains, so as to be prepared for an attack from Austria, and are pressing on the construction of a railroad through Bulgaria and Roumania, so as to draw supplies from home independently of the Black Sea, which may be dominated by the British fleet. Italy seems determined to remain rigorously neutral in any event. In Ireland the Earl of Leitrim, a harsh cruel landlord, has been shot and murdered on a part of his estates where 85 of his tenants were under orders of eviction. His coachman and clerk were killed at the same time. At his funeral, some days later, the populace hooted, cursed and were it not for police interference, would have desecrated the remains. Intense excitement in Ireland, and also in England at this agrarian outrage. In the great boat race on the Thames, between Oxford and Cambridge Universities, the former won an easy victory.

VARIOUS.

The Moffett bell-punch register will probably soon be checking off drinks in Pa., N. Y., Ill., D. C. and La., as its introduction in these places is now under favorable discussion.

Mr. R. A. Arnold estimates, in an article in the Nineteenth Century, that were the Church of England disestablished it would retain a surplus of $600,000,000 after all claims had been met.

Mr. P. Powell, senior member of the firm of P. Powell & Son, Cincinnati, O., died at his home, March 28th. The business of the firm will be continued under the usual firm name, Mr. Wm. F. Powell having sole charge of the business.

A solicitor at Manchester, England, has been sentenced to five years' penal servitude. He defended a client who had stolen a portmanteau from Mr. Parnell, M. P., and was convicted of taking payment from his client derived from the stolen goods, knowing the money to have been thus obtained.

Tea is beginning to take a place almost side by side with coffee in Ceylon, and samples of Ceylon grown leaf have been received and favorably reported on in London. The cultivation of the plant is encouraged by the offer of prizes at the colonial agricultural exhibitions, and experienced planters have given a very favorable opinion of the capabilities of the soil and climate of parts of Ceylon for the production of a high-class tea.

CORINTH, Maine, Feb. 12, 1878.

TO THE DAVIS SEWING MACHINE CO., Watertown, N. Y.—*Gents:* We are manufacturers of clothing; have been engaged in the business for the past fifteen years, manufacturing largely for Miner, Beal & Hackett, Isaac Fenno & Co., A. Sherman & Co., Smith, Richardson & Bates, Prager, Bock & Co. and Leland, Rice & Co., all of Boston. We have used the Davis Vertical Feed Sewing Machine for the past four years in manufacturing our clothing, and we know that it is better adapted to our business, and possessed superior advantages over any of the under-feed sewing machines.

Within the last three months we have had occasion to seam our clothing with double thread, and we find that the Davis Vertical Feed Sewing Machine (and no other family sewing machine) will do the work as well and easily as with the single thread. Yours, truly, T. BRACKETT & SON.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 13, 1878.

BEANS AND PEAS.—Beans of all kinds begins to improve. For standards, mediums have advanced 10c and marrows are 20c. better. Trade is not notably large, but reduced receipts have given sellers more holding courage. Marrows are especially strong as an active Cuban call is expected. Pea beans and white red kidneys not active but not neglected to an extent that makes prices suffer. Canadian field peas in bulk, and bond at 83@84c.; Stock very small; export wants supplied from daily receipts. Green peas continue dull at 112½@300 per 3 bush. box. Southern B. E. Peas 2.80@3.00 per 2 bus. bag. Receipts of beans for the week 2394 bush. Exports do.; 225 bbls; exports peas 195,000 bush.

We quote:—Beans, medium choice, $1.60@1.65; other, $1.40@1.55; marrows, choice, $1.80@1.85; other, $1.60@1.70; pea, $1.25@1.55. White kidney, choice, $1.25@1.55; other, $1.85@1.95; red, choice, $2.10@2.30; other, $1.60@1.70. Turtle soup beans, $2.40@2.50.

BEESWAX.—Small lots have been taken, showing 27½@29c, the ranfle for Western and Southern. Notwithstanding the large exportation compared with last year the market is firm. Exports past week, 5,735 pounds.

BROOM CORN.—Corn offerings are not large and the market is fairly supported. Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 4@5½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Old butter as a rule now depends upon chance sale. Some fine sound firkins will have a place for Southern use until new yellow will stand steamer shipments. The stock of old is not so oppressive as was feared it would be. Still a good deal remains to loose money on. Both sellers and buyers are shaping their regular trade for new and daily receipts pretty nearly fill current wants. After naming creamery as fairly strong in prices; other grades of State are subject to the easy tone incident to this part of the season when Western dairy and factory develop as formidable competitors.

NEW.—State, half tubs, choice, 23@28; good 26@27. Welch firsts, 25@28; second, 23@25c; poor new, 20@22c; Western creamery ranges at 24@35c.; other 26@32c.; W. dairy good to choice 25@27c.; fair 20@24c.; fair to good 15@23c.

OLD.—State dairies, good to choice 20@21c.; fair, 15@17c.; from 15@18c; selected firkins 22@25c; fair to good 18@23c; poor 10@12c; selected half tub 22@24c; other, 15 20c.; choice Fall Welsh 21@23c. Fair to prime 20@26c.; Old Western, 7@12c. for early and 10@11c. for late made.

COTTON has fluctuated sharply as the advices from the other side have been favorable or otherwise, closing about ¼ above the lowest prices of the week. Latest prices are for March, 10.63@10.65c.; April, 10.82@10.83c.; May, 10.94@10.95c.; June, 11.00@11.05c; July, 11.11@11.12c.; August, 11.01@11.16c.; September, 10.85@10.88c.; October, 10.61@10.63c.; November, 10.56@10.57c.; December, 10.57@00.58c.; January, 10.61@10.65c.

Quotations for poor cotton are based on American standard of classification, and on cotton in store

running in quality not more than half a grade above or below the grade quoted.

Strict good middling	11¼	11¼	11⅜	11¼
Middling fair	11¾	11¾	11⅞	11¾
Fair	12¼	12¼	12⅝	12⅜

Stained.

Good ordinary, 7¾c. Strict ordinary, 18¼c.; Low middling, 9c.; Middling, 9¾c.

CHEESE.—Exports for the week 13,561 boxes. Stocks have been steadily reduced, the receipts running light, and there are now very meagre assortments of the upper grades. Fine is especially wanted, and when a line can be found just right the full outside price is made.

Fancy factories, 13@13¼c.; good and prime, 10¼@11¾c.; fair lots, 9@10¼c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 11¾@12¾c. for good to prime; 9@9¾c. for fair lots; 7@9c. for skimmed; Western factory, cheddar, 10@11¼c. for fine; 9@10c. for good; 6@8c. for poor.

Liverpool cable, 63@63s. Gold closes 100¾.

Exports for the week, 13,561 boxes.

DRIED FRUITS.—There is nothing doing in large parcels and in a jobbing way trade is of a limited description, with prices in a good degree nominal.

Apples—State quarters, old, 5@5¾c.; new, 5¾@6c.; Western quarters, old, 5@5¾c.; new, 5¼@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 4¾@5c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@16c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c. Exports for the week 153 bbls dried apples.

EGGS.—Receipts for the week, 18,900 bbls, do, last week, 24,372 do. Unvaried cheapness is still the Lenten marvel of this branch of trade. There seems to be no outside trade to help work off supplies, and the totals have been weekly more than local wants demanded. Trade must increase next week for Easter, but in view of the lull that is apt to follow that feast, sellers will hardly dare to mark up present rates much.

Near points, 12@13c.; State and Penn., 10¾@11c.; Western, prime, 10@10¾c.; Southern do., 10c.; off quality stock, 9@9¾c.; Duck, 20@22c.; Goose, 38@40.

FEED.—Sales are at $19@19.50 for 40 lbs.; $18.50@19 for 60 lbs.; $19@20.50 for 100 lbs.; $19@20 for rye.

FLOUR.—The pacific character of the foreign news, the advanced season to canal navigation and the prospect of larger supplies together with the decline in wheat have caused a weak and lower market.

Latest prices are $4.15@4.90 for poor to fancy superfine State; $5.00@5 20 for common to fair extra do; $5.00@525; $5 20@5 60 for good to choice do.; $4.15@4 90 for superfine, Indiana, Iowa, Michigan, Ohio, &c.; $4 90@5 20 for very poor to good shipping extra do do., (chiefly at $5.20@5.60) and $5 25@5 65 for good to choice extra do.; common to choice white extras, $5.50@6.60; fancy do. at $6.00@7.50; (the latter an extreme); red and amber winter wheat, inferior to choice trade and family, at $5.35@6.50; round hoop Ohio at $5 00@5 35, and trade and family brands of do, $5.50@6.75, the latter for choice; St. Louis, $5.45@6.10 for poor to fair extra and $6.10@7.35 for good to fancy: (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, $5.10@6.10; Minnesota "straight," common to fancy, at $6.50@7.00, and patent poor to very choice, $6.50@8.25, with a few fancy at $8.75@8.50; unsound stock at $2.25@5.75; city mill extra at $6 00@6.30 for fair to very choice for West Indies; do. for England $5.10@5.20; do. trade and family extras, $6.50@7.50; do. South America, $6.40@7.35 for fair to fancy; No. 2 at $2.85@4.00 for poor to strictly fancy (some very fancy lots quoted up to $4.05@4.10 but these are extreme figures).

CORN MEAL—Is selling at $3.15 for Brandywine and $2.50 to $2.65 for Western yellow.

FRESH FRUITS.—Apples have little of interest to mention. A few extra reds, including "Seeks," are quoted at $5@5.50, but grocers and bakers are obtaining desirable styles of Russets at a range of $3.50@4.50, extra large, showy Russets, for special table use, $5; common stock, $2.50@3 ₱ bbl. Cranberry dealers are making the most of the brief life left for crates; all offering freely at $3 for best and $1.75@2.75 for fair to prime. The Florida orange season is over, and when we say that the fact is regretted, a well-deserved compliment to grove owners is expressed. Strawberries will soon have a good position; reduced prices have already increased consumption. They have arrived at the rate of more than 10,000 quarts per day from South Carolina. Quoted at 25@30c. Shippers are using refrigerator cars in addition to steamer shipments, the crop requiring enlarged facilities for deliveries. Peanuts are supported by prospective good demand. $1.40@1.45 for hand-picked Va.; prime, $1.20@1.30; common, to fair, 85c.@$1.15; Tenn., 75c.@1.10. Pecans, 6@8c.

FURS AND SKINS.—A few common skins are changing hands at old prices.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@ 4 00	$2 00@ 2 50
Gray Fox	40@ 45	40@ 45
Red Fox	75@ 80	60@ 65
Black Bear	5 00@ 6 00	4 00@ 5 00
Brown cubs and yigs.	1 00@ 2 00	1 00@ 2 00
Florida deer skins.	15@ 18	
Fisher	5 00@ 6 00	4 00@ 5 00
Mink, dark	85@ 1 00	50@ 60
pale	50@ 60	30@ 40
Muskrat, winter	8@ 10	6@ 8
fall	6@ 7	4@ 5
Kitts	@ 2	@ 2
Beaver, ₱ lb	1 00@ 1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 6
Skunk, black		50@ 60
striped		7@ 30
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

Southern raw skins are worth 20 per cent less than Western.

GRAIN.—The English advices have been very tame through the week, and there have been free sellers of all articles at lower prices without leading to much activity.

Latest sales are of No. 2 old at 60c—ungraded red and amber State, $1 45@1 46—; white, $1 47; No 1 Northwest spring, $1 38; No. 3 Chicago, $1 22½; No. 2 red for March at $1 23; No. 2 Milwaukee spring, $1 27. Rye has been very active, purchases within a week reaching fully 250,000 bush. largely for the German markets, closing at 74c. for Western; 76@—c. for State and 75c. for Canada. Corn is weak and quiet. Latest sales are of New York No. 2 at 53@—c.; steamer mixed, March, 51c. Oats of New York extra white, at 33@36c.; do. No. 1, March 34½c.; No. 2 white, 33½c.; mixed Western, 33@34½c.; white Western, 31@34½c.

HAY AND STRAW.—Receipts have been small, demand has been fair, and prices very well sustained.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

Exports since Jan. 1st, 850 bales; same time last year, 16,450 do.

HIGHWINES.—Is held at $1.08 and $1.07½ offered.

HOPS.—Exports last week only 235 bales and the receipts 914 bales. Prices are without important change, and there is a dull, dragging condition of trade.

State choice to fancy, 11@12c.; good to prime, 7@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

OIL-CAKE.—Western quoted at $30@30.50 per ton.

POULTRY AND GAME.—Receipts have been unusually heavy. Thirty cars of coops for the week. Low rates for eggs perhaps add to the supply. City killers have operated heavily with prices so much in their favor.

Fancy Phila. and N. J. turkeys, 10@12c.; good, 8@9c.; large or Toms, 8@10c.; chickens, choice, 8@9c; Geese are out of good quality, mostly selling at the lower figures. Near Points, $1.75@2; Southern and Western, $1@1.25; ducks, choice, 87c.@$1.12; other, 50@75c.

Wild Pigeons have a ready sale at $1 per doz.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $1.00@1.25; Red-heads, 55@60c; Mallard, 55@60c.; Teal, 25@40c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50, Partridges, pair, 75c.@$1.00, Grouse, $1.00@1.50; poor, 90c.@$1.10. Squab, $1.25@1.50, quality fine. English snipe and Plover, $1.12@1.25.

Dressed poultry in light supply and firm for fresh killed.

N. J. chickens, 10@13c.; W. fowls, 9@10c.; Prime small turkeys, including frozen, 13@14c.; other, 9@12c.; Pa. dry-picked chickens, 16@18c.; do. State and Western, 5@11c.; N. J., 11@13c.; Ducks scarce and firm, 14@20c.

PROVISIONS.—Hog products generally weak and dull.

Mess pork, $9.85@10.00 for spot lots; Bacon at 9.85 for June, 9.95 for July, 6.30c. for long clear and 6¾c. for p ahort clear. Lard—Western steam, 7 29½c. 7.30c. for spot, 7.27½c. for May, 7.35 Tallow at 7 9-16c. for prime. Stearine, 7½c. for prime Western. Beef hams at $15.50@1.6 00 Beef—New extra mess, $12.@12.25; plain, $10.50@11.50; new jac'ket $14.00@15. family mess, 17.80@17.50; extra India mess 26.50 for city brands; do. Philadelphia, $25.

SEED.—Grass are steady. Clover, 7@7¾c. for Western; 7@7 ¼c. for State. Timothy, $1.40. Rough flax, $1.45.

VEGETABLES.—Strictly choice quality potatoes are firm, but the bulk of the supply is offered at inside rates and the market rather quiet.

We quote Peach Blows, choice, $1.50@1.62, common, $1.25@1.37. Early Rose, $1.50@1.62; common, $1.25; Peerless, $1 00@1.25; Nova Scotia, $1.9@2.00; Sweet, $2.00@2.25; New Cabbages, bbl. $1@2; old 100, $4@7; Marrow squash, bbl., $1.37@150; Hubbard do., $2.00@2.50. Russia turnips, 25@80c. Carrots, 75c.@$1.00 Beets, bbl., $1.00@1.25; Bermuda, $9. Spinach, Southern, 1.50 ₱ bbl. Kale, 50c. Lettuce, $2.00@2.50. Radishes, 100 bunches, $1@1.50. Green peas, choice, $2@2.25 ₱ crate.; Fla. string beans $7@5, Asparagus, fair to choice, $5 50@8.50 ₱ doz. Red and yellow onions, 50c.@$1.00 ₱ bbl.; white, 75c.@$1.25.

WOOL.—Prices are essentially as quoted last week with no improvement in demand, the trade generally awaiting the marketing of the new clips.

Ohio, Pennsylvania and Virginia—XXX and picklock, 44@46c.; XX, 42@44c.; X, 42@43c; No. 1, 43@44c. No. 2, 35@37c.; common, 33@35c.; combing, 52@55c.

New York, Michigan, Indiana and Wisconsin—XX, 34@36c.; X, 36@38c.; No. 1, 38@40c.; No. 2, 33@35; common, 32@34c.; combing, 41@43c.

Iowa, Vermont and Illinois—X and XX, 33@35c.; No. 1, 37@40c.; No. 2, 31@33c.; combing, 45@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 37@42c.; unwashed, 25@30c.; unwashed combing, 30@35c.

LIVE STOCK MARKETS.

NEW YORK, April 13, 1878.

BEEVES.—Receipts for the week, 9,009 head; do., last week, 9,253 do. Since Wednesday last the market has declined ¼c; Slightly increased receipts gave buyers a rather independent position, and lower rates for dressed beef, did not give wholesale butchers a sharp buying appetite. Prime to extra bullocks 10@10¾; ordinary to good native steers 8,3¾@9¾c.; Colarado, Texas 9c.; Cincinnatti stillers 9¼c. to dress 56 lbs for bulls 4¾ live. Exporters paid 9¾@10¾c.

COWS AND CALVES.—The bulk of the sales were at $35@55; occasional singles $60@70 but stock equal to the latter in quality is worth about as much in the interior for new milk.

VEAL CALVES.—Trade in live has been very slack, but there is some recovery at the close 5¾c@7c. Hog dressed 5@9c. Receipts for the week 2740 head.

SHEEP AND LAMBS.—Receipts for the week, 17,724 head; do. last week, 16,321 do. The market has ruled weak but rather more active at the close. Ordinary to good clipped sheep, 4¾@4¾c.; per 100 lbs. Unclipped 5.37@5.50; do. Yearlings 7c. Lambs are in demand; fair to good $3@5 per head. Those that weigh 40@50 lbs. here $6@7.

SWINE.—Few in market at the close; no selling price named for live Western. Country pork 4¾@6c. for heavy to light N. J. State should be sent alive; when city killed they sell up to N. J.

DRY, HARSH, UNMANAGEABLE *Hair, is rendered soft and glossy by Dr. Jayne's Hair Tonic. It stimulates the scalp, promotes the growth of the hair, and prevents it falling out. It is also a capital dressing for the hair, and cleanses it from dandruff.*

Reading for the Young.

COPPER TOES.

LITTLE Ned and I were wandering,
Out beyond the maple lane,
Gathering the brown leaves of Autumn,
Listening to the birds' refrain,
When we passed a ragged youngster
Lounging in a mannish pose,
Hatless, but with feet rejoicing
In a pair of copper toes.

From that hour Ned's buttoned buskins
Were regarded with disdain;
Creamy kids and bronzed moroccos
Both were offered him in vain.
When "Our Father" was repeated,
By my side at evening's close,
He would add, "Pease send to Neddy
A new pair of topper toes!"

As the watched-for Christmas neared us,
Every evening darling Ned
Hung his little stocking, slyly,
Close beside his cosy bed;
And behold a paper fastened
To his dainty striped hose,
Covered with queer hieroglyphics,
And a sketch of copper toes.

When I innocently questioned,
Hinting that my eyes were dim,
Taking off the folded paper,
Which was fastened with a pin,
Would he to his precious mamma
That strange cryptograph disclose?
"Santa Claus, pease bring to Neddy
A nice pair of topper toes."

This he read with pleading pathos,
And a conference aside
Quite decided that our darling's
Wish must never be denied.
When he wakened Christmas morning,
With cheeks flushed *couleur de rose*,
How the joyous dimples deepened
As he donned his copper toes!

[*Helen M. Warner.*

THE PRIVATE HISTORY OF AN EAR OF CORN.

BY THE COB.

Our family is an extensive one, but the stalk from which we sprung was select. We trace back to a special variety that was, at the time of our introduction, the subject of extended notice by the unsubsidized agricultural press. Though our family name, Corn, is almost as ordinary as Smith, yet *our* stalk was exceptionally distinguished. Every member of the cob was a kernel!

We were raised with great care: the methods employed in our cultivation assured a satisfactory result. As I look back on the days of our youth, I am sure our subsequent careers could not have been predicted from so calm and ordinary a beginning.

Ah those halcyon days! How fond recollection recalls the familiar field bounded by a fence of elegant proportions that modestly embraced our boundaries, yielding protection without obtruding a visible constraint. The long, even furrows of generous soil; the drills of mathematical precision, and the good-natured rivalry manifested by each grain to over-top its fellows, are never to be forgotten. And later, as we grew to maturity, with what pride we displayed the glossy, flowing silk to the best advantage, and with what secret satisfaction we admitted to ourselves that *our* silk was incomparable; while we damned with faint praise less fortunate companions.

Our immediate family was spared the indignity of being picked for roasting-ears, and while we commiserated the fate of those who were pulled off before their prime, we could not but reflect on the advantages and privileges of springing from a superior variety; such as are not subjected to ruthless interruption at a time when freedom from attack is all important to the attaining of a fair growth. I must repeat those were happy times. During September, we had the first taste of that distinction that afterwards lent the pleasantest flavor to existence. We were distinguished at the State Fair! With what envy less favored corn looked upon us. With what mock enthusiasm they congratulated us when the blue ticket, denoting a first premium, was attached to our side. How they laughed with counterfeited glee as we returned thanks in voices "husky" with emotion!

Shortly after this triumph we passed through our first trial, and our adventures may be said to have fairly begun. We were thrown into a wagon, not too softly, and carried away with a great number of quite common cobs—who from their foolish converse plainly indicated that they had not reached to ears of discretion,—and hurried off to a formidable looking machine up whose inclined plane we could observe numbers of our kind gaily moving. It came our turn presently, and while we felt it our duty to so comport ourselves as to be an example to our uncultivated companions still I admit, in confidence, that I could understand the feeling that prompted their light conduct. They were only about fifty-five pounds to the bushel, and could not be expected to display weight and dignity of manner it is only the fortune of sixty-fivers, moving in best soils, to possess.

We were shocked out of all sense of propriety by an ominous, rumbling sound that presaged a horrid danger. Our family preserved a calm exterior but I felt tremblings along my entire length which conclusively showed that nothing but a high-sense of what was due to their exalted variety restrained them from leaping from their faithful cob, in an agony of fear. But then, being a military family—all kernels, at that—such an action was not to be thought of. We faced the music, and amidst the shrieks of companions in misery, plunged off the scaffolding into a black vortex that seized me with an iron grip, and inhumanly tore each separate grain from the cob. I felt myself enter into the jaws of death—as I thought. I was conscious of a violent wrench, then a heavy pressure and series of excruciating shocks, as each of my devoted relatives were torn asunder and sent bleeding and shrieking under a swiftly revolving fan. Thence they threaded numerous labyrinths, finally emerging into a receptacle placed to receive them, while I, shorn of relatives, denuded, and a miserable demoralized cob generally, was shot up on an incline and off into a waste place where I remained until the following day.

From this time forth I may be excused from obtruding my personal history on the reader of these recollections. Mine was to be, henceforth, an uneventful, sedentary life, mainly of consequence because of my ability to learn and relate the adventures of our family. At this writing, as I rest upon the surface of the earth, slowly disintegrating, I can see how my life has not been without its purpose. It might not be uninteresting to state that previous to my coming here I was for a long time the familiar cob-pipe of a poor, but intelligent country editor. It was from this association that I acquired a taste for literary work, and it may be observed, I think, that my composition has a practiced, cyclopedic, but hurried style that is usual with those who cater to the appetites of intelligent readers, while at the same time they ponder on the ways and means of making the subscriber satisfy their own.—[To be continued.

TALK IN THE SILENT WORLD.

This German system may literally be called the art of teaching the dumb to speak. This will hardly appear impossible if it be borne in mind that the vocal organs of congenitally deaf persons are, so long as they are young, unimpaired. The faculty of producing sound is there, but the idea of sound not being present, no attempt to employ it is made. It is true that by long disuse the larynx loses the vocal property, but in the case of deaf children there is very little difficulty in inducing them to utter articulate sounds, not so clear and musical as those produced from persons who are not deaf, but distinct and intelligible. At the same time the eye of the pupil becomes educated to follow the lips of the speakers, and to gather from their movements the words uttered. The process of teaching children on the German system is curious and interesting. The first aim is to strengthen and expand the vocal organs by gentle exercise, the next to train the pupil to watch the motion of the lips and tongue, and endeavor to copy them. The sense of sound to which the auditory nerve is dead, is next conveyed through the sense of touch, the pupils being taught to feel the vibrations in their own throats and bodies when sound is emitted, and to learn to control these vibrations at will. When a correct understanding and use of all the vowels and consonants have been obtained, the pupils are ready to form words and use them as we do. The building up of language now commences on a plan similiar to that which nature follows when children learn to talk by ear. Simple words and every-day phrases come first, the more difficult being gradually built upon and out of the simpler forms of expression; and the closer the artificial educational plan approaches to the natural ear-taught process, the better will be the result in the end.

In some German schools a a few natural gestures are allowed to be used in the early stages of teaching, but the highest type of the system is steadfastly opposed to all signs, and makes the pupils depend entirely on language as addressed to the eye, the meaning being conveyed by analogy, and language evolved out of language, as one problem in Euclid springs naturally from the one that precedes it. It must not be supposed that extraordinary intelligence is required in the pupils. Deaf children are very observant, and when pains are taken to talk to and with them they soon learn to converse freely with those whom they meet constantly. Conversational language must not be looked for in the first two years of instruction, for it must be borne in mind that a child when its hearing is perfect, takes a long time to learn to talk, but about the third or fourth year pupils of average ability begin to speak very intelligibly. One concession and one only, the deaf children require, and that is, that all speaking to them shall open their mouths widely and enunciate with distinctness, a habit valuable in all, and, as the archbishop of Canterbury remarked, at the meeting at Lambeth Palace, invaluable to clergymen. This is "all that is necessary to put them on a level with others, and to enable them to make their way in the world." In Vienna, a fancy leather merchant, who was born deaf and dumb, employed seventy under him. The Emperor and Empress of Austria visited his workshop before the Vianna Exhibition; he could not only speak the language of his country fluently, but also a little English. The leather merchant had visited England and other countries; was a practical horticulturist, and altogether an agreeable, intelligent, wealthy man—wealthy through his own talents and industry. In a hatter's shop in Friedberg there is a tolo-congenital deaf workman. A man was convicted for theft, principally on the evidence given *vive voca*, in open court by that deaf workman, who stood the test of examination and cross-examinations without any other method of communication being used than word of mouth.

Sabbath Reading.

"ONLY WAITING."

ONLY waiting till the shadows are a little longer grown;
Only waiting till the glimmer of the last day's beam is flown;
Till the night of earth is faded from the heart once full of day;
Till the stars of heaven are breaking through the twilight soft and gray.
Only waiting till the reapers have the last sheaf gathered home,
For the summer time has faded and the autumn winds have come.
Quickly reapers, gather quickly, these last ripe hours of my heart,
For the bloom of life is withered and I hasten to depart,
Only waiting till the shadows are a little longer grown;
Only waiting till the glimmer of the day's last beam is flown;
Then from out the gathered darkness holy, deathless stars shall rise,
By whose light my soul shall gladly tread its pathway to the skies.

A DAY IN THE LIFE OF JESUS.

Luke ix. 10, 17.

The place at which these events occurred was near the head of the Sea of Galilee, where it receives the waters of the upper Jordan. This was one of the Saviour's favorite places of resort. Capernaum, Chorasin, and Bethsaida, all in this immediate vicinity, are always spoken of in the Gospels as towns which enjoyed the largest share of his ministerial labors, and were distinguished most frequently with the honor of his personal presence. The people, removed at a considerable distance from the metropolis of Judea, cultivated those rural habits with which the simple tastes of the Saviour would most readily harmonize. Near this spot was also one of the most frequented fords of the Jordan, on the road from Damascus to Jerusalem; and thus, while residing here, he enjoyed unusual facilities for disseminating throughout this whole region a knowledge of those truths which he came on earth to promulgate.

Some weeks previously to the time in which the events spoken of in this text occurred, our Lord had sent his disciples to announce the approach of the kingdom of heaven, in all the cities and villages which he himself proposed to visit. He conferred on them the power to work miracles, in attestation of their authority, and of the divine character of Him by whom they were sent. He imposed upon them strict rules of conduct, and directed them, to make known to every one who would hear them the good news of the coming dispensation. As soon as he sent them forth, he himself went immediately abroad to teach and to preach in their cities. As their Master and Lord, he might reasonably have claimed exemption from the personal toil and the rigid self-denials to which they were by necessity subjected. But he laid claim to no such exemption. He commenced without delay the performance of the very same duties which he had imposed upon them. He felt himself under obligation to set an example of obedience to his own rules.

It seems that the Saviour had selected a well-known spot, at the head of the lake, for the place of meeting for his apostles, after this their first missionary tour had been completed. "The apostles gathered themselves unto Jesus, and told him all things, both what they had done, and what they had taught." There is something delightful in this filial confidence which these simple-hearted men reposed in their Almighty Redeemer. They told him of their success and their failure, of their wisdom and their folly, of their reliance and their unbelief. We can almost imagine ourselves spectators of this meeting between Christ and them, after this their first separation from each other. The place appointed was most probably some well-known locality on the shore of the lake, under the shadow of its overhanging rocks, where the cool air from the bosom of the water refreshed each returning laborer, as he came back beaten out with the fatigues of travel, under the burning sun of Syria. You can imagine the joy with which each drew near to the Master, after this temporary absence; and the honest greetings with which every new comer was welcomed by those who had chanced to arrive before him. We seem to perceive the Saviour of men listening with affectionate earnestness to the recital of their various adventures; and interposing, from time to time, a word either of encouragement or of caution, as the character and circumstances of each narrator required it.

The lonesomeness of their journey was no longer remembered, as each one received from the Son of God the smile of his approbation. That was truly a joyful meeting.

The Saviour perceived that the apostles needed much instruction which could not be communicated in a place where both he and they were so well-known. They had committed many errors, which he preferred to correct in private. By doing his will, they had learned to repose greater confidence in his wisdom, and were prepared to receive from him more important instruction. But these lessons could not be delivered in the hearing of a promiscuous audience. Nor was this all. He perceived that the apostles were worn out with their labors and needed repose. Surrounded as they were by the multitude, which had already begun to collect about them, rest and retirement were equally impossible. He therefore said to them, "Come ye yourselves apart into a desert place and rest a while." For this purpose, he "took ship, and crossed over with his disciples alone, and went into a desert place belonging to Bethsaida."

The apostles had been for some time past before the eyes of all men, preaching and working miracles. Their souls needed retirement. They would be greatly improved by private communion both with him and with each other. It was for the purpose of affording them such a season of moral recreation, that our Lord withdrew them from the public gaze into a desert place. Nor was this all. Their labors for some weeks past had been severe. They had traveled on foot under a tropical sun, reasoning with unbelievers, instructing the ignorant, and comforting the down-cast. Called upon, at all hours, both of the day and night, to work cures on those that were oppressed with diseases, their bodies, no less than their spirits, needed rest. Our Lord saw this, and he made provision for it. He withdrew them from labor, that they might find, though it were but for a day, the repose which their exhausted natures demanded.

Jesus with his disciples, crossed the water, and entered the desert; that is, the sparsely inhabited country of Bethsaida. Desert, or wilderness, in the New Testament, does not mean an arid waste, but pasture land, forest, or any district to which one should retire for seclusion. Here, in the cool and tranquil neighborhood of the lake, he began to instruct his disciples, and without interruption, make known to them the mysteries of the kingdom. It was one of those seasons that the Saviour himself rarely enjoyed. Everything tended to repose: the rustling leaves, the rippling waves, the song of the birds, heard more distinctly in this rural solitude, all served to calm the spirit ruffled by the agitations of the world, and prepare to listen to the truths which unveil to us eternity. Here our Lord could unbosom himself, without reserve, to his chosen few, and hold with them that communion which he was rarely permitted to enjoy during his ministery on earth.

Soon, however, the whole scene is changed. The multitude, whom he had so recently left, having observed the direction in which he had gone, have discovered the place of his retreat. An immense crowd approaches, and the little company is surrounded by a dense mass of human beings pressing upon them on every side. These are, however, only the pioneers. At last, five thousand men, besides women and children, are beheld thronging around them.

Some of those suitors present most importunate claims. They are in search of cure for diseases which have baffled the skill of the medical profession, and, as a last resort, they have come to the Messiah for aid. Here was a parent bringing a consumptive child. There were children bearing on a couch a paralytic parent. Here was a sister leading a brother blind from his birth, while her supplications were drowned by the shout of a frenzied lunatic who was standing by her side. Every one, believing his own claim to be the most urgent, pressed forward with selfish importunity. Each one, caring for no other than himself, was striving to attain the front rank, while those behind, disappointed, and fearing to lose this important opportunity, were eager to occupy the places of those more fortunate than themselves. The necessary tumult and disorder of such a scene you can better imagine than I can describe.

This was, doubtless, by no means a welcome interruption. The apostles needed the time for rest; for they were worn out in the public service. They wanted it for instruction; for such opportunities of intercourse with Christ were rare. But what did they do? Did our Lord inform the multitude that this day was set apart for their own refreshment and improvement, and that they could not be interrupted? As he beheld them approaching, did he quietly take to his boat, and leave them to go home disappointed? Did he plead his own convenience, or his need of repose, as any reason for not attending to the pressing necessities of his fellow-men?

No, very far from it. The providence of God had brought these multitudes before him, and that same providence forbade him to send them away unblessed. He at once broke up the conference with his disciples, and addressed himself to the work before him. His instructions were of inestimable importance; but I doubt if even they were as important as the example of deep humility, exhaustless kindness, and affecting compassion which he here exhibited. You can imagine yourself the Saviour rising from his seat, in the midst of his disciples, and presenting himself to the approaching multitudes. His calm dignity awes into silence this tumultuous gathering of the people. Those who came out to witness the tricks of an empiric, or listen to the ravings of a fanatic, find themselves unexpectedly, in a presence that repels every emotion but that of profound veneration. The light-hearted and frivalous are awe-struck by the unearthly majesty that seems to clothe the Messiah as with a garment. And yet it was a majesty that shone forth conspicuous, most of all, by the manifestation of unparalled goodness. Every eye that met the eye of the Saviour quailed before him; for it looked into a soul that had never sinned; and the spirit of the sinner felt, for the first time, the full power of immaculate virtue.

Thus the Saviour passed among the crowd, and "healed all that had need of healing" The lame walked, the lepers were cleansed, the blind received their sight, the paralytic were restored to soundness, and the bloom of health revisited the cheeks of those that but just now were sick unto death.—[To be continued. W.

PERSONAL ITEMS.

Spurgeon is solid, and has close cut dark hair and full beard. He wears a soft hat drawn over his face. His great voice is as mellow as ever.

General Joseph E. Johnston is short and slight, but erect; has a short gray beard and a neat style of dress. He expects to be a member of the next Congress.

Gail Hamilton thinks it no impeachment of one's sagacity to be a daughter, sister or friend, but says it's a dreadful endorsement of a man to marry him.

The Crown Prince of Germany is maimed in the left hand, and holds a gun with difficulty. He is a good linguist, and particularly well versed in English.

Gen. John A. Dix is a small man, but also a very active one. Few sportsmen can beat him in bringing down a snipe or a duck, in spite of his years. Gen. Dix regularly draws his pension as a soldier of the war of 1812.

Prince Rudolph, heir to the throne of Austria, who is about to visit the United States and Brazil, is said to be the most arrogant and insolent prince in Europe. His recent visit to Great Britain left a very unfavorable impression.

Mr. Bayard Taylor, our new Minister to Germany, was, a quarter of a century ago, a slight man, but now, what with beer and beef, he has grown heavy. He must weigh over two hundred pounds. He started in life as a printer.

The new British Foreign Affairs Secretary, the Marquis of Salisbury, is described as a tall, thick-set man, with a full black beard, who dresses shabbily and would rather ride in a cab than in his own brougham. He has from boyhood displayed a high order of abilities and is considered the most promising leader of the Conservative Party.

The celebrated one-eyed, Hebrew, French Republican statesman and Deputy, M. Gambetta, recently suffered from symptoms of apoplexy, and his friends fear that if he keeps up his present way of living he will die ere long. He is incessantly reading and writing except when receiving his many visitors. He eats heartily but irregularly, and takes sleep by snatches, as his conferences often last through the early morning hours. He takes no exercise beyond what his carriage gives him in making business visits.

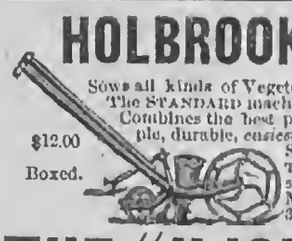
Eaton, Madison Co., N. Y.

HOLBROOK'S "New Regulator" SEED L



Sows all kinds of Vegetable Seeds with regularity. The STANDARD machine. REMODELED for 1875. Combines the best points ever produced. Simple, durable, *easiest handled*, OPEN WHITE SEED CONDUCTOR SHOWS THE SEED DROPPING. Gives satisfaction. Circulars Free. Made by E. E. LEMMUS & Co. 52 S. Market St. Boston, Mass.
$12.00 Boxed.

THE "ILION" RAKE

The Best Self-Discharging Rake in the market. Its simplicity makes it very durable; being less number of pieces which all duplicate, can be put together quicker than any other rake before the public. Has a wide range of quick adjustment. No grass ratchets, etc., exposed to the wind. It is controlled by the will of the operator, leaving both hands free, and is so easily handled that a child can operate it. *Farmers, before purchasing, are invited to give this rake a close inspection*; and if there is not one in your vicinity, write for full particulars to

Wit and Humor.

SPARKS AND SPLINTERS.

Put away the blacking bottle,
That our Sarah used to paint;
She will daub it black no longer.
Gone where things keramic ain't [*Puck.*

A DEAR old lady presented her son, on his departure for sea, with a Bible. On opening it during a gale, it fell from his hands, and outdropped a fine-tooth comb and the admonitary book-mark, "Search daily."

The Boston small girl mixes her theology strangely. When her Sunday-school teacher asked her "Who made you?" she answered, "God made me that length," putting her hands about twelve inches apart, "and I growed the rest myself."

Nature Demands a Tonic

When the nerves are unstrung, the head aches, the appetite is poor or variable, the sleep disturbed, and a general depreciation of vital power is experienced. Such a state of things cannot long exist without the development of serious disease. The most active and genial invigorant known is Hostetter's Stomach Bitters. The absolute purity of its spirituous basis and botanic ingredients gives it a permanent claim to public confidence, and its surpassing medicinal value is admitted by medical men of distinction, by whom it is widely used in private practice. For fever and ague—both as a preventive and remedy,—dyspepsia, liver complaint, bilious remittent fever, constipation, choleraic complaints, flatulence and all intestinal disorders, it is a thoroughly reliable remedy. It is the antifebrile specific par excellence of the malarial districts of this and other countries, where diseases born of miasma prevail, and as a general household remedy it is also universally esteemed.

STOCKBRIDGE
MANURES

Originated by Prof. Stockbridge, Prof. of Agriculture in the Massachusetts Agricultural College.

Made for each crop, furnishing the plant food which each requires. They have been used for five years with such success that in 1877 they were applied on over 10,000 acres with excellent results. **Send for Pamphlet, Mailed Free.** Also for sale, Agricultural Chemicals.

THE OSTRICH.

Of the Bird Class in the Animal Kingdom the group whose members are the largest is that of the Cursores or Running birds, so called on account of their great speed of foot and total impotence of wing, and among these the largest surviving kind is the ostrich. As in the case of the other members of this sub-division of the class, the legs of the ostrich are developed to an extraordinary degree; the bones are long, stout, nearly as solid as those of a horse and almost entirely devoid of the air-cells which give lightness to the bones of flying birds. The wings are almost wanting externally, their bones although retaining the same number and form as those of other birds, being very small, as if suddenly checked in their growth. As the ostrich does not need the powerful wing muscles of flying birds, its breast is devoid of the projecting keel from which these spring, and is smooth and round. Its hight is from six to eight feet, the male being considerably larger than the female and of a blacker tint. In walking while feeding, its stride averages from 20 to 22 inches, when not feeding it increases to 26 inches, and when running, terrified by pursuit, each stride measures from 11½ to 14 feet. When alarmed into flight, it often runs for the first half-mile nearly at the rate of a mile a minute, but its usual running gait is not much over 25 miles an hour. The lower parts of the neck and body of the male are a deep glossy black with a few white feathers interspersed; the color of the female is ashen brown sprinkled with white, and in both, the tail and primary wing plumes are white. These are the white plumes of commerce, while the secondary wing feathers are its long black feathers. The ostrich's voice is a deep, hollow, rumbling sound so like that of the lion that practiced ears have been deceived by it. The weight of an adult male is between 200 and 300 pounds and the birds live from 20 to 30 years. The flesh of a young bird, though a trifle tough to Caucasian teeth, is highly relished by the Bushmen and other natives, but even to these the flesh of an adult ostrich is rank and tenacious. Most of full-grown birds become very fat, and this fat is highly prized. When melted it is of a bright orange color and, mixed with millet flour, it is a feast worthy of a Hottentot chief.

The ostrich is chiefly found in the hot, sandy deserts of Africa where, living often for months without water, its food consists mostly of the wild melons that are scattered over the arid wastes, absorbing and retaining every particle of the moisture condensed in the comparatively cool nights and during the rare but heavy showers that keep alive the scanty vegetation. Grasses, grains and all forms of vegetable life are alike welcome to its capacious appetite, and are ground by its powerful gizzard aided by the stones and other hard substances it gobbles down just as other birds swallow sand or small pebbles. It is gregarious in its habits, associating in large flocks and these are frequently found mixed with vast herds of quaggas zebras, giraffes and antelopes. The male is polygamous, usually having a harem of from two to seven wives

The nest is a mere depression in the sand and in it from 50 to 60 eggs are laid, while a number of supplementary ones are scattered outside around the margin to serve as food for the young brood when first hatched. The male and female take turns in sitting, the hen generally sitting by day and the cock by night, although frequently while the sun is high the eggs are left entirely to its warm influence. It takes from six to eight weeks incubation to hatch out the chicks.

An ostrich egg weighs about three pounds and has the capacity of 24 average hen eggs. They are quite palatable and two of them are frequently eaten by a little Bushman at a single meal. To dress an ostrich egg in the approved fashion: First get the egg; then set it upright

COOLIE WITH YOUNG BIRDS.

on the fire; break a round hole in the top; squeeze a forked stick into the aperture, leaving the stem protruding; then twist the stick rapidly between your hands so as to beat up the contents of the shell while being cooked. To make a nice omelet: Stir some melted ostrich fat into the egg while roasting. Within each egg are generally some smooth little bean-like stones composed of the same substance as the shell, which, for the sake of your digestion, it would be well to reject in eating the egg, in whatever way it may be cooked.

Of late, several ostrich farms have been established at the Cape of Good Hope for the purpose of supplying the market with ostrich feathers, and now, next to wool growing and diamond mining, ostrich farming has become the most important industry of South Africa. The most extensive and successful farmer of this kind is Mr. DOUGLASS who originated the business near Grahamstown. He started ten years ago with three wild birds to which eight more were afterwards added. As soon as he found they would lay in confinement, he began his experiments in artificial hatching. For the first three years he met with little success until he invented his patent incubator which has since come into use among all engaged in this branch of industry. It is a low, ugly piece of pine furniture standing on four legs, and is about eight or nine feet long. At each end there are two drawers in which the eggs are placed wrapped in flannel. The drawers, by means of screws beneath, are raised or lowered two or three inches. Over them, along the top of the whole contrivance, is a tank filled with hot water. When open the drawer is lowered, and when closed, it is screwed up so as to bring the side of the egg in contact with the bottom of the tank so as to supply the necessary heat. In the center below the machine one or more lamps give additional warmth. The ostrich turns her egg frequently, so that each side may receive due attention; similarly the ostrich farmer must turn his eggs at least three times a day. A certain amount of moisture is required, as in nature moisture exudes from the sitting bird. The heat must be moderated according to circumstances, or the yelk becomes glue and the young bird is choked. There are certain signs which indicate when the chick is ready to come to light, but it often happens that it cannot pierce the thick shell, and unless helped, as shown in one of our engravings, it would die. Afterwards the ostrich farmer must take upon himself all the functions of an ostrich mother, and must know all that instinct has taught her or he will be pretty apt to fail. So successful, however, have care, study and ingenuity made Mr. DOUGLASS that his eleven birds have been increased to upwards of 900, and stimulated by his success, a large number of imitators have started business in the same neighborhood. Of these some have realized 50 per cent per annum on their capital, while others have sometimes lost their entire investment.

Some idea of the nature of the business may be gathered from the fact that an egg is worth, in gold, $25; a chick just hatched $50, and a full-grown bird $375. A few years ago to purchase either an egg, a chick or an adult bird, these figures would have to be at least doubled. Plucking begins when the bird is 18 months old and two crops of feathers are gathered each year, each bird annually yielding the value of from $45 to $50 in gold. The feathers are sorted into various lots in a room appropriated for the purpose, the white outside rim plumes from under the bird's wings being by far the most valuable. These are sold for $125 per pound.

Some of the arid, waterless tracts of our western territories are excellently adapted for an experiment in this branch of industry. Mr. DOUGLASS' farm comprises 1,200 acres of rough ground formerly devoted to sheep-farming, but owing to a change of grass and other causes, it had so deteriorated that it was no longer profitable for that purpose. Three hundred ostriches, however, find a livelihood on its bushes and grasses without receiving any supplementary food except when sick or very young. In the latter case, a Coolie has charge of about thirty birds, and from sunrise to sunset goes about in the lucern-fields with them, cutting up the lucern or breaking bones for them, besides supplying them with gravel and water. The farm is divided into paddocks, and of birds that are breeding, one cock with two hens occupies each paddock. The younger birds—for they do not breed until three years old—or those which are not paired, run in flocks of thirty or forty. They are hardy brutes which can stand a great deal of heat and cold, can do for long periods without food or water, require no delicate feeding or close attention, and at present prices, yield a very remunerative crop of feathers. It would be unwise, however, for a large proportion of our readers to invest their money in accordance with this hint; for the value of the feathers depends in a great measure on their rarity; Fashion is a capricious deity; and when Biddy wears ostrich plumes, Arabella is pretty apt to lay them aside.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

MR. C——, left two sows together until one had pigs,—result, one left alive out of a litter of eight. The next day the other one had seven—too much bedding—result, five left alive. Then he said he would make up in quality, what he now lacked in quantity, so he turned both sows together after a few days and the two have six pigs. This is after the Shorthorn notion to make several cows suckle one calf. Sows should be separated at least a month before the pigs are due, and not more than a handful of fresh straw should be given to them for a bed. We have known pigs several weeks old to be laid on by a large mother when they had too much bed, and the pigs to be smothered. In an adjoining town more than a hundred sows will not have pigs this spring. They were all taken to one sire. In another neighborhood the dams do not have but two and three pigs each. This confirms the theory that young sires are not as sure as older ones, and certainly not so certain as those which have been tried. Most farmers are stupidly willful, or willfully stupid about stock animals, and this kind of practice once in a while bears its legitimate fruit, and maybe they will learn a lesson. Pigs from a well-bred sire are worth twice as much as scrubs to fatten, which any one can prove by keeping an account of the feed used and amount of pork made by scrubs, and the feed consumed and the pork obtained by the same number of well-bred animals. It is not necessy to have thoroughbreds to do this, but pigs one-half pure-bred will show a marked improvement and profit over common swine. Why? Because they are naturally more fleshy; because they are quiet and do not fret and run their flesh off. More than this; there is not so much food required for waste material, bone, bristles, snout, legs and general hogology, to root, to squeal, to fight, etc., which latter habits a well-bred pig does not have. All these things are so much wear and tear which feed has to supply. Then there is another constitutional proclivity in which a pure-bred pig excels, and that is a tendency to fatten. On this account if designed for breeding, they must be lightly fed or they will be too fat and lack in bone and muscle. The great trouble with the breeding sires is heavy feed and a lack of exercise. When kept shut up in a pen, they cannot be trusted.

Eight pounds of Jersey butter which had been left in the bottom of a stone jar in the cellar for nearly a year without any covering over it, neither salt nor brine, nothing except the cover of the crock, was brought up the other day and reworked and made into two rolls, and brought ten cents a pound more than the highest market price on account of excellent quality. It was so solid and firm that it had kept sweet under circumstances which in our cellar would have spoiled any ordinary butter. We are convinced from this fact that pure Jersey butter will stand exposure and would be valuable for long and trying voyages, or for use when it is necessary to keep it a long time.

When calves are three weeks old they will eat a little meal. We begin with a handful stirred into their milk. At the end of the week they may be given two handfuls, and when six weeks old they will eat a quart and do with less milk. Sweet milk is costly feed to give to calves. Veal calves are not worth fattening this spring as there is no sale. They used to bring $10 when four weeks old, and gradually dropped down to $4 and $5. This year, no demand at any price. Cows keep up in price as high as they have been for several years. This is one of the anomalies in trade, which it is hard to understand. It must be that the low price of grain is causing farmers to increase their dairies. This is a mistake often made; to rush from one thing to another. Better stick to one trade. A few years ago almost everyone went into hops and after a considerable outlay were glad to hop out.

A hen was found so lame she could not walk. Parasites under the scales around the joint just at the edge of the feathers, were the cause. Two applications of turpentine effected a cure, followed by annointing with coal tar. The turpentine killed the insects, invisible to the naked eye, and the coal tar healed the soreness.

An inspection of the baby's nut grove planted a year ago is most gratifying. The filbert bushes are alive and have put forth their spring tassels; the Spanish chestnuts are budding out finely, and the English walnuts do not seem to have minded the winter at all. What jolly times there will be one of these days, if all of these strangers to our high northern latitude continue to grow and do well! We have faith that they will. The native nut trees, chestnuts, shagbarks, (walnuts) butternuts, and black-walnuts are all starting and so are the black mulberries. The latter are not nut-trees, but the fruit is nice and they are new in this region. All of the fruit trees in this section promise abundance this year, not excepting peaches.

HOUGHTON FARM.

GRADUALLY but surely the regeneration of this naturally beautiful estate is progressing. One erection of barns after another, and other conveniences continue to grow into prominence and to be inhabited by every variety of live stock.

The mares had foals, the cows had calves and the sheep have lambs, so that the whole premises are alive with the coming and rising generation. A great deal of road-making was done last year, and substantial fencing commenced, and doubtless another year will complete the improvements which have already produced one immense structure besides minor ones which have been admired by countless hundreds of visitors. Rather more than half way up the East Mountain a good graded road has been made, which opens an easy communication with a fine level pasture on the summit of the mountain where there are more than one hundred acres free from timber.

This fine range of pasture will probably be stocked with young cattle and colts and the flock of sheep will be the chief stock in the fields nearer home till the fat lambs are all sold. On this farm it is intended to feed the stock well from its birth, so that there may be one course of prosperity till the meat goes to market as first-class.

It will be arranged for every animal born to have from its birth a mission which has to be carried out. A lot of lambs intended for the butcher have their mission, which is to become plump and fat and the ewes have the *role* of making as much milk as possible, and the shepherd must do all in his power to cause a good flow of milk which, if he has the food of the right kind, he can easily do if his knowledge is gained from long practical experience. The ewes suckling lambs intended for the butcher must, of course, have first-rate feed and go to grass early and continue to be fed night and morning in the yard with oil-cake and oats.

It requires one continued course of good feeding to produce good lambs, but there appears to be no knowledge of the kind of early "house lamb" which has such a ready sale in London, England, and which is killed very young and is never allowed to eat. The writer of this had 96 Dorset ewes and sold the lambs when about eight week old at from $9 up to $10.50, according to the market and the ripeness of the lambs. He supposes they are much dearer now in London because beef and mutton are. It was twenty-five years ago. G. G.

Horticultural.

JOTTINGS FROM MY NOTE BOOK.

LOOK TO YOUR PLANTS AND SHRUBS.

THE caution in a recent number of the RURAL, against too much haste in uncovering plants and shrubs, north of New York city, was very timely. Plants, shrubs and vines that have been protected during the winter, are frequently injured by the impatient haste of the owner to remove the protection on the first indications of the opening of spring. There is all the more danger of this the present season, in which winter has apparently closed at a much earlier date than is common in our climate. But I wish there had been an additional caution for, not unfrequently, the error runs to the opposite extreme, and the plant suffers in consequence, especially if the covering is deep. I have frequently seen leaves, coarse manure, rubbish, etc., recommended as a winter covering; and the inexperienced, desiring to insure efficient protection, apply an undue quantity of the material. The snows and rains of winter wet this and pack it down so closely as to exclude the air entirely, and the result is that when a few warm days occur in succession, in early spring, the plant is suffocated from lack of air, and becomes moldy, or mildewed, and perhaps heated to such a degree as to destroy its vitality. This is especially the case where too large a quantity of manure is used, even if it be coarse when it is applied.

To guard against such injury, it is well to loosen up the material with a fork occasionally as the warm weather advances, for the purpose of admitting air to the plants, before it is safe to remove the covering material entirely. Where loose dirt is used alone for covering, there is less necessity for looking after the plant, as the earth itself is sufficiently porous, and is not liable to be heated by any process of fermentation. Although these hints come rather late in the season, perhaps it is not too late for them to be profitable in some localities. CLINTON.

Farm Economy.

RYE FOR GREEN MANURE.

WM. J. FOWLER.

THE experiment which I tried last fall in sowing rye to be plowed under this spring is a decided success. The rye already covers the ground in a dense mat and by the middle of May will give several tons of green manure to be turned under. Much of this will be water; but for the crop I intend to plant, (potatoes) a good supply of moisture is quite as important as fertility. I more than half believe that one reason why potatoes are a better crop on rich soil than on poor is because the rich soil retains moisture better in summer droughts. A heavy growth of rye turned under in May will decompose rapidly, furnishing both heat and moisture to the growing crop. Even as early as this, I can see that the rye is helping the land. Its net-work of roots draws moisture from the soil which is thrown off by the leaves, and also gives considerable drainage. I can walk over a mass of rye in early spring, while bare ground plowed in the fall is too spongy and wet to bear my weight. I have no doubt it will pay to sow rye on corn or potato stubble in the fall, when it is intended to plow early and sow oats or barley. For this purpose it should be sown very early so as to get as good a growth as possible in the fall. At the best, there cannot be much to plow under in April; but the increased dryness of the soil, enabling earlier plowing, is very important. The green manure under the furrow will also have a slight effect in keeping the soil from becoming too compact. In other words, it will make the soil warmer and dryer in early spring and moister in the hot dry weather of July and August.

Rye is an excellent crop to sow in orchards to be plowed under as green manure. Young orchards should be kept exclusively in hoed crops; but the serious difficulty is in finding manure to keep the soil in condition. Six or ten acres kept in hoed crops every year will require all the manure usually made on a hundred-acre farm. Either the orchard must be neglected or profitable cultivation of the rest of the farm be abandoned. Clover will not help us out here, for good as clover is everywhere else, it is death to young trees. The clover plant makes its growth during the summer and its roots strike down, robbing the trees of necessary moisture. What is needed for orchards is a crop whose roots do not penetrate deeply and which makes its growth in fall or early spring while the trees are at rest. Rye answers these requirements exactly. Besides, with rye as green manure the ground is plowed at seasons when injuries to the roots by plowing are most easily repaired. When clover is plowed under in midsummer, tearing the roots of the trees often gives them a shock which does more injury than the decaying clover can do good.

On other ground than orchard, clover will and should be the main crop for plowing under. But on every farm there will always be some corn or potato stubble which would remain bare during the winter, and on such fields rye should always be sown. It is always injurious to land to be left naked at any season, and during the winter a growth of rye is about the only practical mode of protecting it.

Monroe Co., N. Y.

MANURES.

JUDGING from letters we are constantly receiving, there is a good deal of misapprehension as to the several objects of experimenting with commercial fertilizers as between the Stockbridge manures and those to which we have referred as best suited to ascertain what particular manurial ingredient any given plot may stand in need of. The principle of the Stockbridge manures is that of furnishing plants the food which by analyses has been found to enter into their composition and which is more or less deficient in the soil. It is taken for granted that most soils are sufficiently supplied with magnesia, silica, iron, &c., but that they need potash, nitrogen and phosphoric acid, which when added in sufficient quantities will restore to the soil all the food which the plant needs.

Now, soils differ. Some may contain a sufficiency of potash—some lime—some phosphoric acid, &c. What we propose is to ascertain, by using special fertilizers on different plots, those elements of plant food which are already existing in the soil in sufficient quantity. If, for example, phosphoric acid were found not to add to the natural product of the land, the experimenter would know that it would be useless to purchase phosphate of lime (bone) or superphosphate. The Stockbridge manures are intended for the same purposes as stable manures. The use of special fertilizers upon small plots, which we have advocated, is intended solely to ascertain, if

this is possible, what special food the land needs, and what special food it is already provided with, so that the farmer may not spend his money in the purchase of what he already has an available stock of on hand.

Field Crops.

CULTURE OF BROOM-CORN. NO. 1.

W. H. WHITE.

To grow the finest and best brush for which broom-corn is grown, requires proper soil and thorough preparation, good seed, seasonable planting, clean culture, timely harvesting, with suitable preparation for market or working, requirements essential to the economical production of any farm crop.

The tall-growing variety is the kind to which my experience and observation are limited, and it is the sort generally grown in New England. The dwarf may be as good, but having never seen it tested, I am not qualified to recommend it. I have heard it condemned as growing brush too slender, on some soils, which would be a serious objection. The seed should be selected from growing plants, previous to harvesting the general crop. Choose those plants which are the earliest and most healthy, with fine, long, thick and compact brush. Let the seed ripen before cutting from the stalk, if possible in the field, if not, cut at the roots and shelter from freezing; then cut, dry, and thresh it separate from the general crop, running it through a fanning mill to clean it of all light and immature seed. Save it through the winter, as you would any choice seed, where it will be free from vermin, moisture, or liability to heating, etc. Such a course of selection continued for a term of years, will surely improve any variety, producing fine crops and those likely to escape early frosts.

The soil proper for broom-corn should be dry; wet or moist soils do not answer at all. A rich and deep loam, or alluvial soil, such as we find on the high banks on the east side of the Connecticut River, or on some of the high grounds further back, is desirable.

To obtain the finest and best brush, the soil should have been cultivated to some hoed crop, one or more years from a sod, as a close sod is apt to grow a heavy, coarse, undesirable brush. If a sod is to be used, clover is best, next, a clover and timothy sod, treated as follows: In the fall, or early winter cart out and spread broadcast, over the sod, a thick coat of good stable or yard manure, and let it lie till spring, when it should be plowed down, breaking and working the ground deeply; pulverize well, after allowing it to lie a few days to settle, etc., and plant to Indian corn, potatoes, or some other hoed crop, fertilizing the same in the hill or drill, the object being to reduce the sod. This such treatment will do and put the soil in fine condition to grow a good crop of broom-corn the following year, provided thorough, clean culture is given this first crop. Strong, or coarse manure applied the same season the crop is grown, is unfavorable to the production of fine good brush; and the land needs a previous dressing to avoid the necessity of high manuring the season the crop is planted. If necessary to fertilize at all, a shovelful to the hill of fine well-decayed farm manure gives the corn a fine early start, and a lively fresh green color.

An important item, in growing a good crop, is in plowing and pulverizing the soil preparatory thereto, and this is one which is apt to receive too little attention generally. Plow deep and well, and make the soil fine by harrowing etc. This should be done in spring, about the same time that we plow and fit our ground for Indian corn. Strike out the rows, preferably north and south, as giving a better sun exposure, three feet apart, with a one-horse plow, and in these drills place the fine well-rotted manure, three to five cords per acre, thirty inches apart for the hills. I prefer hill to drill culture for convenience of tillage. It is essential that the plants start into a quick growth at once, as they are somewhat tender, having only a slight hold in the soil, and are easily affected by unfavorable weather. It is not best to plant till the soil gets warm, following Indian corn rather than going before.

If the best seed is had, ten or twelve seeds to a hill are plenty to guard against accidents etc. Haul a little soil over the manure, drop the seed on that and cover with one-half inch of fine soil. I adapt these directions to small growers who wish to grow *good* crops; when forty, to one hundred acres are grown with only limited help, other modes may be better, but no one should attempt to grow this crop in any such proportion to help if he expects to obtain the highest market price for his crop.

As soon as the plants are up, and the rows can be distinguished—which should be in twelve or fifteen days—begin to cultivate; don't wait for the weeds—it is the corn wants the culture. Early culture gives the plants a start, and they grow all the better for it; follow the horse cultivator with the hand-hoe, carefully freshening the soil in and about the hills and plants. A second dressing needs to be given in ten to twelve days when the plants should be thinned to six or eight; no more than four to six should be allowed to mature in a hill. If the plants do not thrive to suit, give them a dressing of ashes and plaster—gypsum—mixed, about a tablespoonful to the hill, at or before the second hoeing. This dressing is a good one even when the young corn looks satisfactory.

The after culture may be principally done with the horse-hoe, taking care to keep down all weeds, and to keep the crop thriving. As much as possible should be done by horse labor, but clean, thorough culture is essential and especial attention should be given while the plants are young and small.

Worcester Co., Mass.

THE HUMMING BIRD.

Sheep Husbandry.

TRAINING A SHEEP DOG.

Miss F. V. B., Canaseraga, N. Y.—Commence breaking the pup when not older than six months. Pups from well-broke parents and ancestors on both sides of the kennel are most likely to prove sensible and easily trained. The best place to train the pup is on the road. In driving sheep on a journey, he will learn more in a month than in herding on a range during summer. The first thing is to teach the pup to mind your word; call to him kindly by name, and if he doesn't come at once, pinch his ears until he learns prompt obedience. A couple, or more, severe floggings are an almost indispensable part of a pup's training, but be sure he knows for what offence he is being whipped. Let the punishment follow the offence promptly, and if it can't be administered then, don't whip him an hour or two later, or when he has forgotten all about the matter. Nearly all directions to the pup should be given by motion of the hand in the direction you wish him to go, and always accompany the voice by motion of the hand. After your pup has learned to mind the word and is trained to march back and forth from one side of the flock to the other at the sweep of your hand, commence to teach him to pass up the side of the flock. To do this make a motion with your hand up the side you wish him to go, throwing your arm out as you would to direct a man beyond the reach of your voice; and call out "Away up!" until he gets hold of your meaning. To teach him to go clear round a flock and so turn them towards you, repeat the motion of sending him up the side until he gets partly round the head of the flock and then call him down on the opposite side. After he has once learnt to go round the flock, a sweep of the arm from the side whence you wish him to start to the other, is the proper motion, accompanied with the cry "Around them!" Always call his name before giving any order, and be sure to make the directing motion with your hand. To teach him to drive behind the flock in whatever direction you wish to go while leading on ahead: get the flock in a lane, yourself in advance, and if the dog undertakes to follow you, drive him back, and when he has got to his place, keep an eye on him and sing out occasionally "Drive them up!" To train him to bark whenever you wish, make a fuss yourself and so get him excited and then sing out "Speak to them!"

What makes a sheep-dog a shepherd, is the instinct, natural or acquired, which leads him to trot to and fro behind stock, and a well trained animal will take as much pleasure in driving sheep as ours do in following a wagon. Always treat the dog kindly and rationally, and when compelled to whip him, when it is over pat him on the head to show you don't bear malice, and to prevent him from sulking.

DARWIN tells us, in his Researches into Natural History, that in Banda Oriental, South America, it is a common thing to see flocks of sheep guarded by one or two dogs, at a distance of some miles from any house or man. The method of canine education there practiced, consists in separating the puppy, while very young, from its mother and in accustoming it to its future companions. A ewe is held three or four times a day for the little thing to suck, and a nest of wool is made for it in the sheep pen. At no time is it allowed to associate with other dogs or with the children of the family. The puppy is moreover, generally castrated, so that, when grown up, it can scarcely have any feelings in common with the rest of its kind. From this education it has no wish to leave the flock, and just as another dog will defend its master, man, so will this the sheep. On the approach of a stranger, the dog immediately advances barking, and the sheep all cluster in his rear as if around the oldest ram. These dogs can be readily taught to bring home the flock at a certain hour in the evening. Their most troublesome fault when young is their desire to play with the sheep, and in doing so they sometimes gallop their charges unmercifully. They come to the house daily for some meat and as soon as they get it, skulk away as if ashamed of themselves. Away from the flock they seem timid with regard to other dogs, but when with their charge neither domesticated nor wild dogs dare venture to attack them.

WOOL-GROWING AND THE TARIFF.

THERE has been an important conference between the wool-growers and the woolen manufacturers in regard to proposed changes in the tariff as it now stands. The policy agreed upon was to oppose any modification or reduction in the duties upon foreign wools and woolen fabrics. The present tariff was adopted ten years ago and was the result of careful and thorough consideration on the part of the representatives of all those interested in these two great industries. Notwithstanding the protection now received, sheep-breeding has decreased east of the Mississippi River in ten years more than four millions in number. The truth is, growing sheep for wool will not pay in all this vast region, but it can be made to pay with mutton as the basis. Fifteen hundred sheep are now sent in the carcass weekly in the refrigerators to foreign markets and the demand is gradually increasing and would increase faster if there was enough of first-class mutton to be had.

The same is true of the domestic demand. We want more and better mutton and this will beget more consumption and, of course, greater demand. The farmers east of the Mississippi, want to take hold of the subject and work it out to a successful conclusion. The sheep interests are of such magnitude and importance to this country that Congress cannot permit any material reduction in the protective duties, which will jeopardise these interests. West of the Mississippi, sheep breeding has increased many millions within ten years and will go on increasing very fast if the wool-growers are protected. In these vast areas of country growing sheep for wool is a profitable business. The woolen interests are now being carefully watched by a competent committee who are authorized by the late conference to take such action as may be deemed best, having received full and complete instructions in regard thereto.

MALIGNANT ANTHRAX IN SHEEP.

DAVID. M. Pittsfield, Pike Co. Ill. asks what ails some of his flock of thirty sheep: lately five ewes were taken ill very suddenly, and for over two weeks continued getting better and relapsing alternately. Then one died, three were killed to put them out of their sufferings; the fifth got well and is raising twins. They held their heads very high, would lie down and stretch out their feet stiffly and remain so until helped up. Sometimes they would eat a little meal if it was held up to them. They all had dead twins. None of the remaining sheep were affected. Some said "worms" and turpentine was given without effect; others said "poison" and strong coffee was administered without doing any good. The dead animals would have been opened, but they were so offensive even before their death, that the operation was impossible.

ANS.—Although it is impossible to decide for a certainty from this description, there seems little room to doubt that these sheep were affected with a form of anthrax or *charbon*. This disease is always very fatal in its effects and has never been treated with much success in sheep; in fact, American writers on the diseases of these animals have either misunderstood its nature entirely or have given but the most unsatisfactory descriptions of it. The antiphlogistic treatment recommended by English veterinarians is entirely out of place and should never be attempted. The treatment practiced by PROF. LAW with cattle would probably give best results. Give 20 drops nitro-muriatic acid and 40 grains chlorate of potassa in a pint of water twice a day. Be careful to wash well with soap after being around such animals, as the disease is communicable to man.

D. E. SALMON, D. V. M.

The Naturalist.

HUMMING BIRDS.

THE Humming Bird in all its genera and species is peculiar to this Western Hemisphere and the adjacent islands. They belong to the larger family of *trochilidæ*, of which there are three sub-families, the wedge-tailed humming birds, the curved-billed humming birds, and the straight-billed humming birds. The most brilliant species adorn the tropical forests where they flit and flutter amid the rich drapery of the orchids, whose splendid blossoms rival the beauty of these "glittering fragments of the rainbow," as AUDUBON aptly calls them. As the distance from the tropics increases their numbers decrease, and only a few species are found within broad limits of the United States, though some of these are met with as far north as latitude 57°

Everywhere the family may be recognized by their diminutive size, gorgeous plumage, long, slender and acute bill, and peculiar tongue. There are probably 400 species though the range of some of them is very limited. Everywhere too their manners are the same; very quick and active, nearly always on the wing, constantly displaying their brilliant hues as they dart to and fro in the sun. While their bodies are suspended, apparently motionless in the air over a flower in which they are feeding, their wings are moved so rapidly that they become invisible, causing a humming sound

whence their common name is derived. These jewels of the air seem to disdain the ground which they rarely touch, though they readily perch on branches. Bold and familiar they are frequent denizens of gardens in thickly settled localities, sometimes entering rooms and flitting fearlessly close to passers-by. Full of courage, they are very pugnacious and will unhesitatingly attack any intruder coming near their nests. These are usually placed on trees, shrubs or reeds, average about an inch in diameter and the same in depth, are delicate but compact, and lined with the softest vegetable downs. The eggs, one or two in number, are generally about half by one-third of an inch, of a white color, and hatched in 10 or 12 day.

It is difficult to keep humming birds in cages, though they have been kept in rooms and conservatories for months feeding on honey and sugar and water, and the insects attracted by these dainties. Although they are fond enough of honey, insects are essentially their food, and their barbed and viscid tongues are admirably adapted for drawing these from the depths of tubular flowers over which they delight to hover. The bill when closed forms a tube through which the long, divided and thread-like tongue is protruded into deep flowers.

Of the curved-billed humming birds there are more than 100 species, none of which are found in the United States. As represented in the engraving, the bill is long and slightly curved, the tail long, broad and in the males of some species decorated with a couple of protruding feathers. Brazil is the favorite habitat of this entire subfamily.

PLOWS AND PLOWING.

The season for plows and plowing is again here, and it is well that we take a retrospective view of what has been done the last year and see what is in store for the next. Improvements crowd upon us so fast that we can hardly keep pace with them, and to say that anything is perfect in the way of farming tools is heresy.

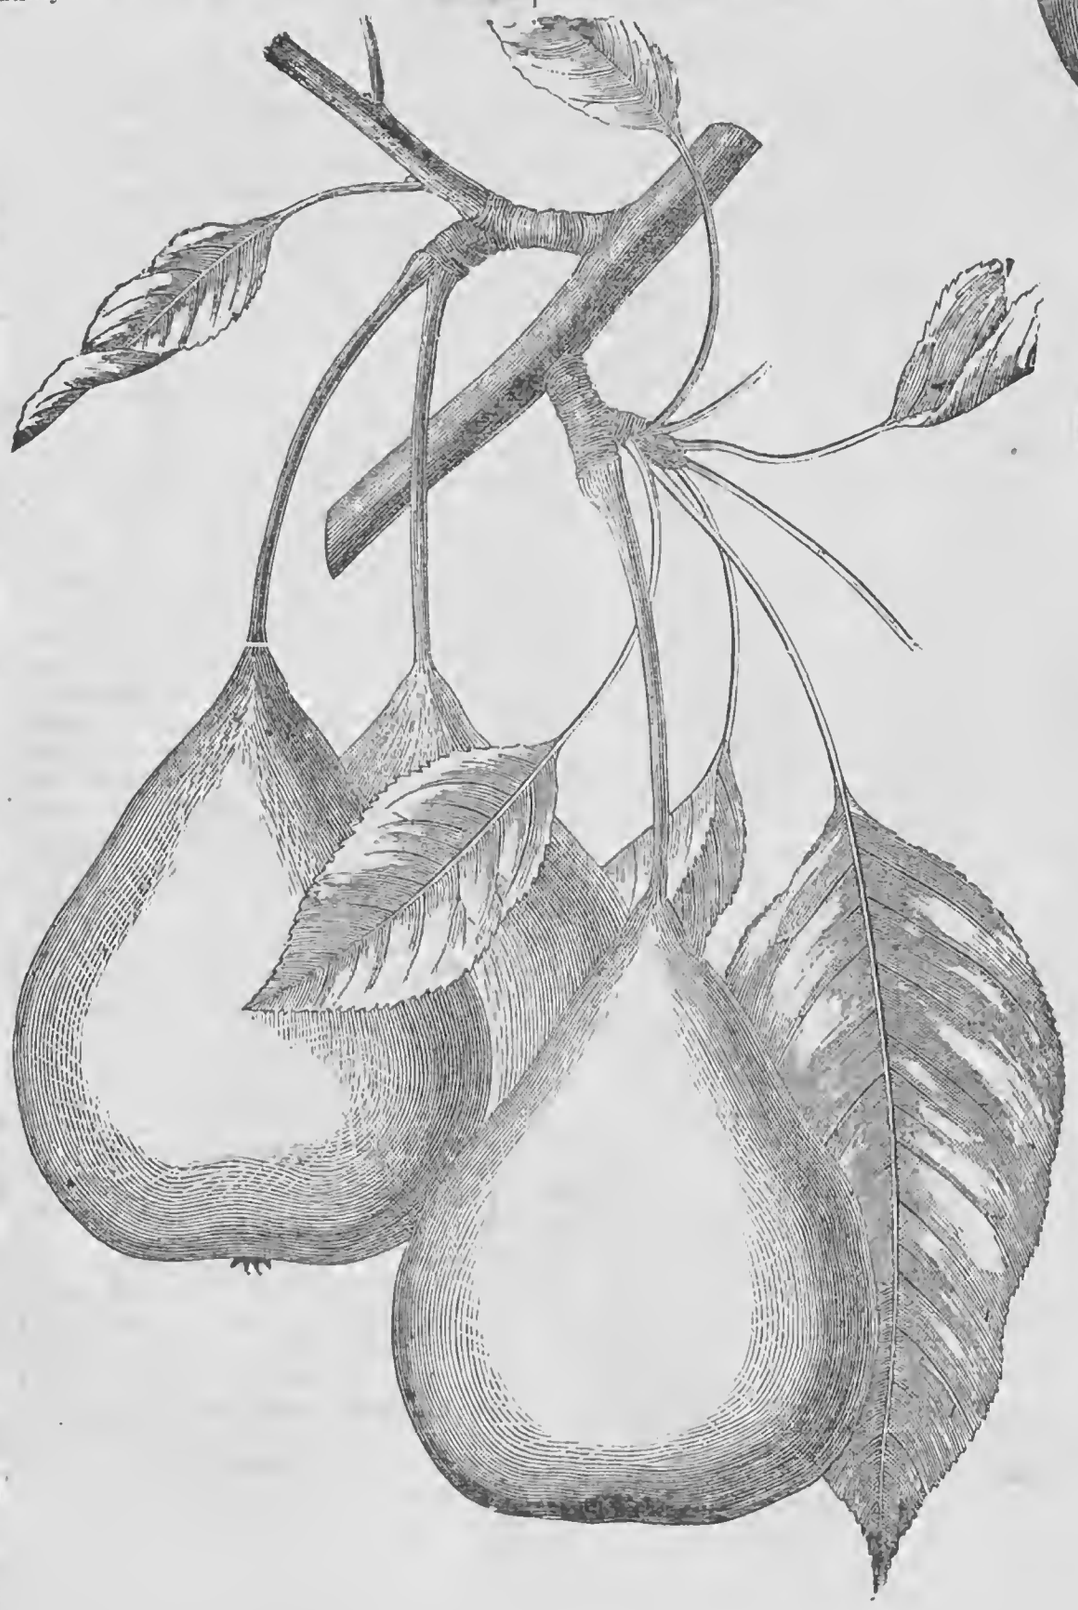
Not quite a year ago we held a plow trial in this township and many good plows were represented, all of which were considered first-class. The new Chilled Metal Plows were in favor on account of their perfect clearing in our muck soils where others failed. While our trial was in progress a strange visitor in the line of Chilled Plows made its appearance on the ground. I refer to the Gale Chilled Plow made by the Gale Manufacturing Co., Albion, Mich. This plow attracted attention because of its peculiar form and lightness of draft. The agents, Messrs. Hahn & Ruhlman, spoke to me in regard to the difficulties of introducing this new plow, as others of good make had the lead, and most of the enterprising farmers were supplied with good plows. I did not encourage the agents in the face of these difficulties, but they secured the agency and went to work selling the plows on trial. The results have been most extraordinary. Farmers seemed to discard their other purchases and now, in traveling over this region, the Gale is seen everywhere. I had thought this plow mania had fastened on to the farmers, and the desire seemed to be for something new at the sacrifice of utility, as I know of many who last fall told me they would not buy any new plow while they possessed a good one, and this spring I see these same parties sporting a Gale. Well, my curiosity led me to ask many how they liked the new departure, (I fancied nice paint and a fine appearance had captivated them), but all replied: It is the best Plow I ever held, as well as the nicest looking.

To satisfy myself I set about a minute examination of the different points in the form, etc. The form at once leads me to think the inventor a thorough genius. The share and entering point of the mold board are of decided Scotch pattern, and enter the ground in a way to get the least possible draft. The form of the turning part of the mold board seems to combine that shape necessary to turn a sod nicely and yet make a good stubble plow. The land-side is formed so as to cause the least friction possible, and care has been taken in the construction to prevent clogging. The beam is adjustable and the draft, for depth or width, is regulated in a moment. The new style handles and the manner of regulating by moving up and down, to suit a tall or short man, is an achievement combining two valuable principles, the greatest of which is this: The point where the handles fasten on to the beam is beyond or in front of the main body or "heft" of the castings. The adjustable bearings of the handles at the rear of the beam and castings are the fulcrum, and the plow is handled with such ease that upon the slightest movement must be apparent. The ordinary style are fastened at the rear of the beam castings, which is the principal cause of what is known as "kicking." This "kicking" is greatly reduced in the "Gale" for the reasons above given. The jointer and colter arrangement is ingenious and practical, combining strength, convenience and style.

I have carefully dissected this plow and must admit it combines so many good points that these admissions are due against former prejudice. I am free to admit that nothing is impossible in the way of improvement, and even the Gale Plow may be improved upon; if so, this plucky firm will soon find it out. It is a fact of every-day repetition that no two men see the same utility combined in the same tool, consequently we need a variety of differently constructed farming implements to suit different ideas, but I have never seen so many united in one implement, and farmers are fast educating themselves to be judges of the tools they use. Hereafter imposition will be next to impossible.

It is not within my province or my desire to disparage other makes of plows as I am using the "Oliver" and others which are indeed good plows, and have a great sale, the Oliver being a great favorite with me in many respects. These hastily written views are not at random as I have tried to investigate and understand the different principles combined in farm implements and hope in my own locality to share the reputation of being somewhat practical in this respect. My efforts are unbiased and with an eye single to promote the general weal.

Boardman, O., April 15 D. B. Raymond.



TYSON.

Pomological.

PEARS.

BEURRE D'ANJOU.

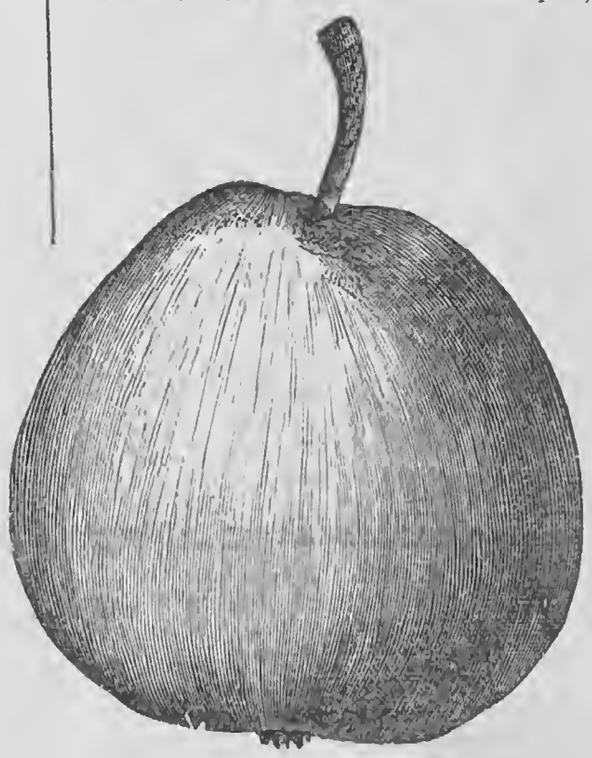
Of all the pears that we have tested in the Rural Grounds, there is no other of which we are enabled to speak more highly for general excellence. See page 265.

The flavor is vinous and rich, the flesh, slightly yellowish, is finely grained, melting, and buttery. It begins to ripen in October and keeps well until early, sometimes mid-winter. The tree is very hardy, of rapid and shapely growth. The fruit is above medium size, regular, greenish yellow with a dull red cheek, somewhat marked with russet. In this location it is also one of the best upon the quince.

The American Pomological Society gives the D. Anjou two stars for the following states: Vermont, Mass., R. I., Conn., N. Y., Mich., Penn., N. J., Md., Va., O., Tenn., Ill., Iowa, Neb., Kan., S. C., Ga.

BEURRE SUPERFIN.

Our only specimens of this excellent pear,



PAUL AMBRE.

planted four years ago in the fall were so injured by the next winter (the coldest for many years) that they have been slow to recover. We first saw the trees and tasted the fruit in the grounds of Messrs. Ellwanger and Barry five years ago. It is a very juicy pear with a decided but very agreeable acidity. The skin is russeted upon greenish-yellow. The tree is vigorous as a standard and does well upon the quince.

The A. P. S. gives two stars to the following states: Mass., Md., and D. C., S. C., Ga.

TYSON.

This is one of the finest of summer pears, of medium size and perfect shape, of a bright yellow color. The flesh is of fine texture, buttery, juicy, sweet, and aromatic. Ripens the last of summer. It grows rapidly on quince or pear but does not come into bearing very early.

The A. P. S. gives one star to the following states: Md., and D. C., Ky.

THE CHURCH.

This pear is very little known when its great merits are take ninto the account. See page 265.

It is very productive and the fruit is uniformly good. The flesh is melting and buttery and the flavor rich, sweet and excellent. Ripens September.

PAUL AMBRE.

Ripens in October. Aromatic melting, buttery. Medium size, greenish-yellow and russet It resembles Beurre d'Anjou. The tree is both vigorous and productive.

There are three varieties of fruits that are fast being superseded by better varieties and we are glad that it is so. They are the insipid Bartlett Pear, the coarse Concord Grape and the sour Wilson Strawberry.

Veterinary.

MALADIES OF STOCK.

ANSWERS BY D. E. SALMON.

POOR APPETITE IN A HORSE.

M. M. A., Wirt Center, N. Y., wishes to know what is the matter with a four-year-old horse. Although the animal has a first-rate appetite for

grain, he won't eat half the hay a healthy beast ought to, and what he does take is eaten without relish in a half-hearted sort of way; consequently he can't stand hard work as well as his mate, and such work makes him fall away in condition speedily.

ANS.—This horse is probably of a different temperament from his mate and may never be as hardy. In such cases medicines at the best have only a temporary effect and are not always satisfactory. Make the animal's surroundings as healthy as possible, *i. e.*, keep in a clean, light stable, see that he is well groomed twice a day, give pure water for drink, feed bright, plump clean oats and first-quality hay. As medical treatment, try one-half pound Glauber salts in two equal doses, morning and night, to be followed the second day by powders composed of eight ounces powdered gentian root and two and one-half drachms of powdered nux vomica, well mixed and divided into doses of one-half ounce each. One dose to be given morning and night.

AILING STOCK.

Miss F. V. B., Caneseraga, N. Y., says they have one two-year-old colt and two yearlings which had the distemper, epizootic—or something of that kind—last August and September. Afterwards through family bereavement, the animals fell into the charge of help who fed them poorly so that they began the winter in ill condition. They have had good hay and four quarts of oats per day; will not eat mashes or potatoes. They eat pretty well, but don't gain a bit, are weak and mere scare-crows. As they are expensive blooded stock, it is important that they should be put in good condition. 2. They have also a four-year-old heifer that gives four quarts of milk a day, has been stabled and fed meal and slop enough to make her fat—but her hair is rough, she has a continual cough, her mother was a superior cow with the ugly drawback of hair standing the wrong way.

ANS.—1. The proper treatment for horses is given in answer to M. M. A. above, whose animal is affected substantially in the same way.

2. Give the cow one pound of Glauber or Epsom salts dissolved in water; the next day give half this quantity; and follow this the third day with the tonic powder which is recommended in the inquiry already referred to for horses in a similar condition. The doses and time of giving should be the same as with horses; it is readily taken mixed with food. The action of the salts would be assisted by adding one or two ounces of powdered ginger to each dose.

[For answer to third question, see Sheep Husbandry.—EDS.]

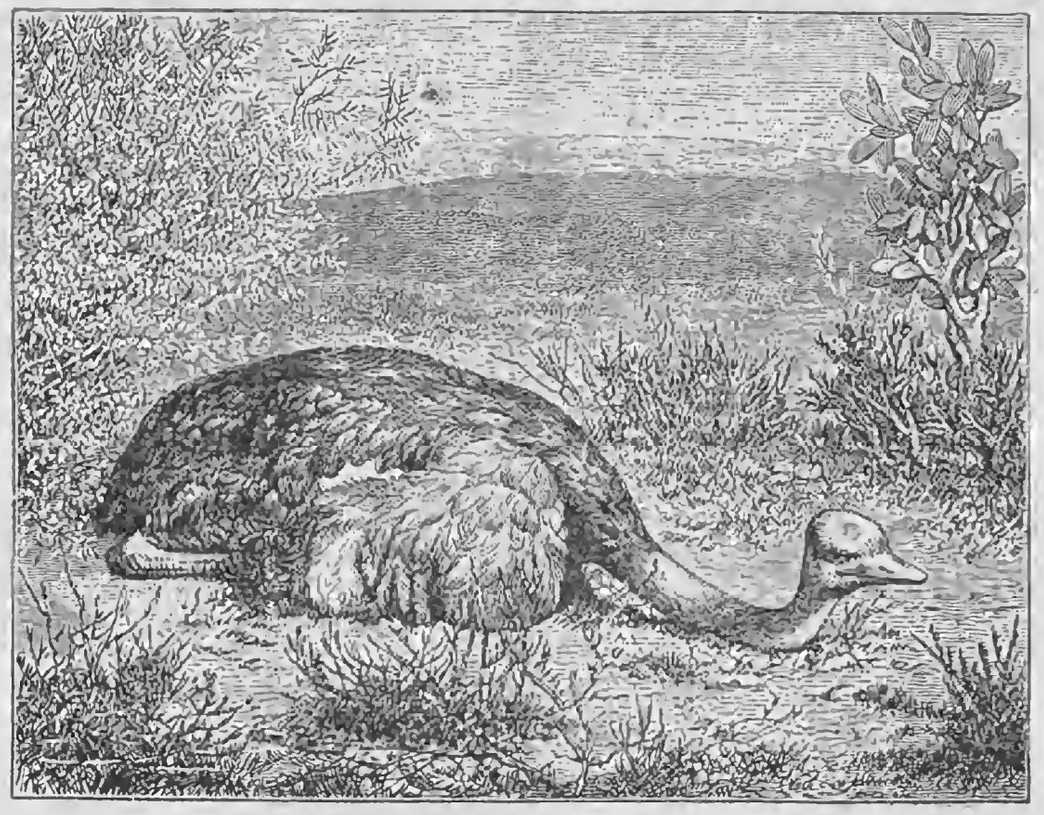
Everywhere.

FALL vs. SPRING SOWING IN NORTH CAROLINA.

LAST fall I wrote a letter of inquiry to the RURAL about sowing grass seed on twenty-five acres for permanent pasture. I was advised to sow the land to rye and have the grass seed all sowed by the 15th Sept. But as it was impossible for me to do so, I did the best I could to get it sowed early. I was necessarily compelled to sow the land to wheat as it was about all the wheat land I had to spare. I had sowed a good portion to red clover last spring and the fall previous. Moreover I had tried rye a time or two before and failed; and there is not much market for rye here at one-third less than the price of wheat.

So I commenced sowing wheat early in October and sowed grass seed as fast as I got the wheat in. I just sowed the seed on the fresh plowed land after the wheat was sowed, without harrowing. The first sowed, about four acres, was a steep hill that was in corn, the only crop that had been on it for at least fifty years, as it had grown up with pines and they were large enough for saw-logs. On that I have as fine a stand of grass and clover as I ever saw. The ground, wherever it is moderately good, is perfectly matted already. The next sowed, about five acres, was fallow land of the same description, except not so rolling. It had been cultivated one year before in corn. On this there is a good catch of grass, but as there was rain on the land after the wheat was plowed in and before the grass was sowed, it did not grow so fast nor did it come up as well. The next sowed was about three acres of old pasture land. Some of it was rich and all considerably rolling. It had been in wheat the year before and in corn the year previous. This was sowed about the 20th of October, and at first I did not intend to sow the grass until this spring as I thought it was too late; but the ground was in excellent order and I sowed the grass seed. On this I have only a moderately good stand. I must here say that the fall was very favorable to grass, as there was abundance of rain, which was the reason that the last was not sowed sooner.

The remainder of the field is about twelve acres of old field, having been in broom sage for several years until last summer a year when it was turned and sowed in wheat. On this I commenced sowing grass seed, following with a grain drill with 160 lbs. of Merryman's dissolved bone to the acre, about four weeks ago, and after sowing about two-thirds of the field I was stopped by rain. On this the grass is up nicely, but I would much rather risk what was sowed in the fall. The remainder of the field has been sowed about two weeks or more, but as there has been no rain since it has not come up yet.



A BIRD SITTING.

The winter has been rather unfavorable to grass as it would freeze hard at night and thaw the next day, and so on, sometimes for a week at a time. I am satisfied that if clover or grass can be sowed in the fall in time to get it up, it is much better than the spring for this latitude. My experience with clover is that, as a rule, it is as liable to die from sun in the summer as from frost in the winter. The former liability is entirely obviated if sown in the fall and it will make a pretty fair crop the first year, which it will not do if sown in the spring.

In this county we can raise almost anything. I made last year 1,400 lbs. seed cotton to the acre on ten acres. I also made 450 bu. of wheat on fifteen acres of old land; also 100 bu. sweet potatoes on a quarter of an acre, and other things in proportion. I always raise mixed crops and it pays best. Everything is low in market: Wheat about $1.10; corn, 50 cts.; sweet potatoes, 60 cts.; Irish, $1.00; country bacon, 8 cts.; butter, 20 cts.; eggs, 7 to 8 cts.; land from $5 to $18 per acre, according to quality and location. S. A. L.

Mill Bridge, Rowan Co., N. C., April 5.

NORTH CAROLINA NOTES.

M. B. PRINCE.

SCRUB HOGS.

AFTER a little experience with a Razor-Back pig I thought nothing could induce me to ever own another, but having lost nearly all my Berkshires last summer, I was obliged to purchase such as were to be had in the neighborhood and among the number were two of the genuine Simon Pures, with not the least indication of Berkshire, Essex, Chester or Duroc. Slaughtered when seven months old, each weighed twenty-five pounds less than a half-blood Berkshire five month old, though receiving the same feed and care. If some of those worthy people who think a hog is a hog and nothing more, will try one or more of these long-legged, long-nosed, fence-jumpers, with hams like a cat and ears like a cabbage leaf, and try to fatten it by the side of any of the improved breeds, I am sure that they will become convinced of the great superiority of the latter when dressed and on the scales if not before.

THE COW FOR THE SOUTH.

In this section of the South we have given but little attention to the improvement of domestic animals. Our cattle are what are usually denominated "Natives"—small, scrawny, and giving to the observer every indication of poverty. The bulls are seldom castrated until one or more years old, which gives them the thick, unsightly, stag-horns. They are put to work when two or three years old, usually singly, before the cart and plow, making a very efficient little team, and it is truly wonderful how much plowing a freedman will accomplish with a fair specimen of an "old steer" as they call everything of the ox kind. Several Jerseys, Shorthorns, and Ayrshires have been introduced in different parts of the State, but I am convinced that the Devon is the stock for the South. Being active both in the harness and out they would accomplish nearly the work of a horse and at the same time thrive on our thin pastures. The flesh of our "Natives" is quite inferior, which would give the Devons another advantage. Moreover the latter, as cows, are much better milkers, and though not equal to the Shorthorns as meat producers, or the Jerseys for the butter dairy, yet taking all points into consideration—the demand for working cattle, the price of butter, our thin pasturage, and their adaptability to fatten—all combine to give them the leadership, and to make them popular in the South.

RURAL SPECIAL REPORTS.

ILLINOIS, April 15, 1878.

ABOUT the seed exchange I offered in RURAL: It has kept me busy, since hundreds of letters have come! The RURAL should certainly be a good advertising medium. Some of the foremost and most noted horticulturists in the country have applied. In all my replies I spoke many good words for the "RURAL." If I were to engage in it again, I should hire a clerk. A. C. W.

FAIRVIEW, Erie Co., Pa., April 16, 1878.

IN looking over the old RURALS of 1872, I noticed a letter from IRENE TURNER of Florida—stating that if any of the readers of the RURAL wished to know anything about Florida, she would answer their questions—the name of the county where she resided was not mentioned or I should have written to her. If agreeable to her I would like to correspond.

MISS S. E. RULE.

Entomological.

CUT-WORMS IN GREEN-HOUSES.

B. PICKMAN MANN.

THE moths, whose eggs produce cut-worms, fly, according to the species, from as early as June 9 to as late as September 9, perhaps beyond those dates. Even the same species does not always lay its eggs in the same way or in similar situations. The young caterpillars feed on roots and stay under-ground, but the older caterpillars mount the stems of herbs or of low trees, eating the buds, leaves, tender twigs or the stems themselves. Some of these caterpillars cut off the stems under-ground; others drag the stems under-ground before they eat them. All have the habit of feeding at night, and those which come out of the ground at night to get their food are snugly hidden again before day. Therefore frequently the twigs of young trees are kept bare, and the cause of their bareness is not known. The caterpillars will be found near the trunk of the tree or at any rate beneath the branches, and not very deeply buried. Most if not all the species are caterpillars when they go into winter-quarters, and wait till some time in May before they sally forth for the food on which they are to finish their growth. But some either pass the winter as moths or in the egg stage, thus coming to the destructive period of their lives later, while others, favored by circumstances, come out earlier.

A case of the latter kind has lately come to my notice. A large bed of Carnation Pinks, grown in a hot-house, was severely injured by the destruction of the buds. Large holes were found to have been eaten in the sides of the buds, and the contents consumed. Fully one hundred dollars' worth of pinks were lost in this way, according to the owner's statement. Upon visiting the house in the night, with a light, some of the caterpillars were caught at their work. An examination of one of these and of the descriptions which have been published hitherto, relating to cut-worms, shows a great resemblance between this caterpillar and that of *Agrotis inermis*, as described by RILEY in 1869. Although precisely such a case as the one now under consideration seems not to have been reported before, it is interesting to know in this connection that the caterpillar of *Agrotis inermis* was found to be destructive to grape vines in a cold frame, coming out of the ground in the night time and climbing the vines to get its food, returning before day-break. Chickens were admitted into the cold-frame, and allowed to work, so that in two days no more of the caterpillars was to be found. Probably it would not be allowable to admit chickens into a hot-house where their scratching would do as much harm as good, but a patient search by the less skilled but more judicious fingers of a human would accomplish the end sought, and the captured prey need not be eaten by the capturer unless it was relished.

The night visitation of the infested plants is another means of putting an end to the evil. The plants may be gently shaken, and the caterpillars thus dislodged and exposed to view. Of course the caterpillars must be killed. They are good travelers and can stand a long fast. Some persons have been sufficiently non-sensible to bury them alive. The parent moths ought to be excluded from the hot-houses. They may be of many kinds, and one or another will be in season all summer. They are especially attracted to lights and sweets, and fly mostly, if not only, at night. Therefore if the windows are not always closed at night the openings ought to be covered with some kind of fine netting. I shall have something to say upon the more general means of guarding against the ravages of caterpillars at another time.

Middlesex Co., Mass.

The Querist.

ANSWERS TO CORRESPONDENTS.

Blowing up Stumps with Dynamite.

A. C. Jr., Arcaster, Ont., and several others inquire how stumps can be removed by dynamite, its cost and where it can be purchased.

ANS.—No. 2 Giant Powder would be the proper kind to use. It is furnished in cartridge rolls which may be safely cut into lengths weighing four, six or ten ounces as required. The consistence of the powder is much like that of brown sugar or damp Graham flour. Each cartridge costs about fifty cents. The fuse is to be inserted in the metallic cap which accompanies the cartridge, and held in its place by indenting the lower rim of the cap upon it. A hole is then made in the end of the cartridge with a stick of the proper size, and the cap with the fuse, is pushed into the cartridge. To make room for the charge, a hole must be made as near as possible to the center of the stump by means of a crowbar or other implement. It is then tramped firmly with earth by the use of a wooden rod. The more compact the ground the better the result. If on sloping ground the hole under the stump should be made from the upper side. When all is ready, the fuse is fired like an ordinary blast. A heavy charge throws out and shatters the stump; a lighter one splits it, twists off the larger roots, and leaves it in a shape to be easily dealt with by the ax and draft cattle. As a very heavy charge throws the fragments of wood and possible stones to a great distance, it is safer to use only so much powder as will bring the stump into manageable condition. The greener, tougher, and firmer the stump the better the results, as the force of the explosion is then mainly expended in shattering it. With proper care dynamite is quite as safe as any other explosive, but from want of skill in handling it, and carelessness often arising from long immunity from accidents or from recklessness, its use is sometimes dangerous. Where a good deal of ground encumbered with stumps is to be cleared in any neighborhood, it would be well for the land-owners to engage the services of a man skilled in the use of the article. The cost of removing stumps in this way would probably average from forty to fifty cents each. This would be a heavy tax on some farmers settled on such lands, who would thus have to pay as much for clearing it as its original purchase cost them; but the extra yield of crops and the greater ease in tilling would in many cases amply repay the outlay. The conditions of each case and the state of the farmer's purse must determine this matter. Dynamite can be purchased in this city from A. W. DESPARD, 26 Cedar street, who would probably furnish more detailed information suitable to the special circumstances of any one who may correspond with him on the subject. Probably the best way for anyone to secure a supply, would be through some dealer in gunpowder in the next town or village, as the dealers in it in this city do a wholesale business chiefly.

Use of a Drained Mill-Pond, Etc.

J. E. E., Sheffield Mills, Nova Scotia, says: We have a mill-pond covering about 100 acres, which has been flowed for nearly 120 years. It is surrounded by cultivated land and fed by several streams. Two years ago it was drained for the purpose of converting it into hay-land, by draining it in summer and flooding it in winter. The land can be easily drained, is quite free from stumps and nearly all of it is covered with an exceedingly rich deposit, from two to three feet thick. Last year we cut over 100 tons of hay, all of which came in naturally, without any seeding. On some parts the crop was from three to four tons to the acre. If flooded in winter, what would be the most profitable seed to sow on it? Can Timothy or Herd's-grass be grown on it successfully? Will Alsike clover do well on such land, or will it die out in winter? (2.) What would be the best kind of wagon for carting off the hay? (3.) How should shoes for horses, fit for traveling on soft land, be made?

ANS.—We think unless the mill-pond is flooded for the purpose of propelling machinery, it would be better to keep it drained and cultivated for a grain crop. Timothy would kill out before a sod would form, and undoubtedly it would be a waste of time and money to seed with any kind of clover. The flooding would destroy it. The variety of grass most sure to succeed, and one of great value as hay for cattle, is Red Top, the Herd's-grass of the Southern States. We have known it to yield four tons to the acre and over. A small percentage of Timothy can be sown with it. The former will help to retain the latter. This has been our experience. It would be wholly useless to sow it alone.

2. For carting off the hay, a wagon with very wide felloes, similar to those in use in the northern part of Indiana, would be best.

3. For horses working on soft ground, wrought plates, made thin and rather wide, are the best. We would have no shoes on the hind feet, unless the land has some stones on it.

Sheep on Permanent Pasture.

T. A. C., Mill Bridge, Rowan Co., N. C., inquires whether it will hurt his permanent pasture to let sheep run on it after wheat harvest until fall, if not eaten too closely.

ANS.—Sheep will enrich land by feeding upon it, as they eat almost everything and convert it into rich manure. Their urine is also a valuable fertilizer, and as they distribute this and their droppings generally over the field, the beneficial effects of pasturing land with sheep are apparent. When the pasture is poor and the growth is stopped on account of drought, they will eat too close for the good of a permanent pasture, but not otherwise. On account of this same tendency they are useful to feed upon fallow ground, as they will keep it clean and free from weeds.

What Ails the Canary?

C. Maxwell, Butler Co., Pa., wants to know what's the matter with a pet Canary. He commenced molting and ceased singing, eight months ago; appears well, but continues to lose his feathers, and though anxious apparently to sing, is unable to do so.

ANS.—All that we can advise is only to keep the bird away from all draughts and change its food. We have never known a Canary affected in this way to resume singing with its previous zest. Does any reader know a remedy?

Miscellaneous.

F. V. Boylan, Allegany Co., N. Y., asks what can be mix with or put on his seed corn to prevent the cut-worm from eating it.

ANS.—We know of no remedy except to open the earth about each plant every morning and kill the worm. It will always be found just under the surface and within a few inches of the plant. We could give a score of said-to-be remedies, but after testing most of them, can recommend only the above tedious but effectual means of extermination. There are various kinds of larvæ known as cut-worms. We presume our inquirer refers to the greasy, ash-gray caterpillars that cut off tender young plants during June and July.

Venoria, Tecumseh, Mich., asks: (1. How soon will Geraniums flower from the seed? (2.) Does the apple-scented variety blossom? (3.) Which are the most desirable varieties to grow. (4.) Will Verbena, sowed the last of April, flower freely this summer?

ANS.—1. If the seeds are planted now, they will bloom by Christmas; if planted in the fall, they will bloom in July.

2. Certainly.

3. There are thousands of varieties and it would be difficult to select. For double we know of none better than Marie Lemoine, rose; Dr. Jacoby, salmon; Dieul de Strasburg, deep rosy-purple. For single, Madame Vaucher, white; Jean Sisley, scarlet, white eye; Mrs. Christine, rose; Wellington, maroon-crimson.

4. Not until the latter part.

M. N. H., Hoboken, N. J., asks for instruction concerning the making and management of an "Incubator" for hatching chickens.

ANS.—From some personal experience and a good deal of information gathered from books and poultry adepts, we have come to the decided conclusion that the making and use of an "Incubator" by one unskilled in the matter, will result in disaster oftener than nine times in ten. If success with one of these devices is attainable, the probability of it lies in purchasing one made in accordance with the results of experience by practiced hands. Should our correspondent make such an investment, ample directions for the management of the special contrivance will accompany his purchase.

S. F. W., Niagra Falls, N. Y., inquires where Fuller's Teasel—Dipsacus fullonum—can be obtained.

ANS.—E. R. Gregory, Skaneateles, N. Y.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, APRIL 20TH.

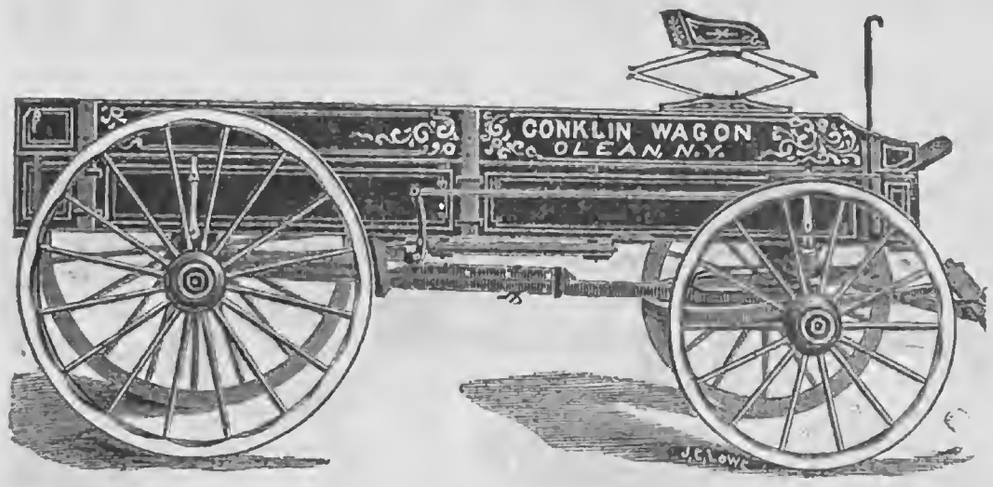
Industrial Implements.

THE CONKLIN WAGON.

THE advantages of good implements, tools, etc., are never so strikingly apparent as when one has been persuaded, from economical or other motives, to purchase an inferior article and finds, at the most inconvenient time to acquire the knowledge, that it is not well to put



THE CONKLIN WAGON.

one's trust in shoddy. This is strikingly true of wagons. Some of our readers—not many we hope—may recollect with dismal distinctness how a low price and bright colors have induced them to invest in a vehicle that served every purpose until, in a time of great hurry, the wagon was slightly overloaded, and driving over a small obstruction, lo! there are annihilation and a waste of time and temper whose money value outbalances the difference between the price of a good and bad article.

In nothing, perhaps, has one to buy on reputation to so great an extent as in the purchase of vehicles. It is so easy for unscrupulous dealers to substitute unsound for sound timber, trusting to a plausible varnish and pleasing paint to disguise these sins of omission: and they do it.

The Conklin Wagon, made at Olean, N. Y., by W. H. & D. C. CONKLIN, is an honest piece of work. It is constructed of sound, selected, timber and put together with a view to combine lightness, strength, easy draft and durability. The wheels have fourteen and sixteen spokes, well proportioned to the gears, and the tires rarely have to be reset. An extension reach, or coupling, simple and easily shifted, is used. Box is of good length and proportion, with top box and seat. Minor appliances, such as brakes, etc., are the best to be obtained. In fact, everything is complete. All the wagons are set up and fully inspected before leaving the works.

The founder of the firm first made wagons in Wyoming Co., Pa., some forty years ago, with a capital consisting of a thorough knowledge of the business, good health and a conviction that to succeed required industry, intelligence and push. It has been an axiom of the firm that they could only succeed by selling an article worth the money asked for it, and to this belief, put into practice, do they attribute their unvarying success.

The manufacture is personally supervised by the firm, and it is only necessary to add that by strict adherence to these principles the sales have steadily increased, and the reputation of the Conklin Wagon is second to none.

The Poultry Yard.

FOWLS FOR EGGS, TABLE AND HARDINESS.

HENRY HALES.

BEING requested to give the readers of the RURAL advice on the best poultry to buy for eggs, table and hardiness, I must necessarily go over some of the same ground that has been gone over before in the RURAL, but, as the subscribers to the RURAL are constantly increasing, and young members of the families who take the RURAL are growing up, I offer no further apology.

For the farm the Leghorns occupy the first place as layers. The eggs are large, white and of handsome shape; a large basket of them has a finer appearance than a lot of odd sizes and colors, as laid by a mixed lot of barn-yard fowls, and they will sell better on the market. Between the White and Brown Leghorns the difference is principally this: the Browns lay at a younger age than the Whites, and will lay more eggs in a given time, treatment being equal, although many of the eggs are rather small for the market, but if the smallest are picked out they make a good marketable size. On the other hand, on an average the Whites lay the greatest weight of eggs in a given time. In warmer localities, say south of Philadelphia, the Black Spanish, Minorcas, and Andalusians, are the best breeds, as they lay very large eggs without stint. The Black Hamburgs are also hardy, and lay a fair-sized white egg, but I have not known of any kept on a farm in large numbers. They rank high as prolific layers, and bear confinement in a moderate-sized place, with a small grass plot. All the Hamburgs are very handsome and for a family where the eggs are consumed, nothing can equal them in beauty; but the silver golden breeds lay small eggs, yet they are the most prolific layers known. They will not stand keeping many together, nor close confinement, as they are of a restless, active temperament and pine in confinement.

Taking these considerations into account, the Leghorns are the farmer's fowls. They will lay as well, if not better, pure bred than crossed, if the cocks are procured from unrelated stock every year. This must be done in all cases to promote a full development of eggs, but if any cross is made the Light Brahma is preferable; some of them will then sit. I should have said all the above are non-sitters, excepting an occasional hen, and she will generally be a Brown Leghorn.

For sitting hens there are a number of varieties to pick from. First as careful mothers are the Dorkings. They also keep longer with their broods than other hens. The Brahma and Cochins are good sitters but are not adapted for small eggs, as they are heavy and clumsy. They do well on their own for the shells are thicker. But a cross-bred hen of any kind, especially if of part Brahma blood, will do to hatch with.

For the table, Dorkings and Houdans are the first both in flavor, heavy meat, and tenderness. They have long breasts, and small bone for their weight, but I would not advise any farmer to breed them pure for early chickens. Cross with the Light Brahma and you have a bird that will mature earlier than any pure-bred fowl of its weight. They feather quickly, and make fine broilers when eight to twelve weeks old. Other large breeds are too bony at that age. Two cocks, Dorkings or Houdans, will improve the progeny of twenty-five hens and increase their value as table fowls materially. Dorkings or Houdans pure are still better table birds, but they require more care in cold winter. In milder climates they will do well, and are good layers. As farmers' fowls in mild localities they are first-rate; the Dorkings doing their own hatching and being great foragers, cost but little to keep on open ground.

I have not said much, as may be noticed, so far of the large breeds, or Asiatics. Kept for laying or killing, bred pure, they consume too much food for profit, but are just the birds for a small place where fowls must be kept confined. They are so quiet and hardy that the introduction of the Chinese fowls was the greatest acquisition any country ever received in the poultry line. They can stand any climate, are contented anywhere, if only well fed, and lay in winter. For hardiness no other fowl equals them; that is why they are recommended to cross with on a farm. About one-eight Light Brahma blood will make Leghorns hardy, but will not improve their laying. If one has a proper, warm house for his stock in winter, this is not a necessity, but if they have to take the run of cold out-buildings, a lot to which poultry must submit on most farms, then a cross is indispensable in cold climates.

In regard to the cost of these fowls, it depends much on what a person expects. If the "American Standard of Excellence" is consulted, birds bred pretty true to the points there laid down, are expensive; for but few birds of any variety reach near such perfection, nor for utility to a farmer are they wanted. Of underweight birds, if not stunted by being late hatched, Light Brahmas of six or seven pounds are as good as heavier birds or even better. All the others above mentioned that are a little off feather can be procured at a moderate price, from one to two dollars each, but do not expect show birds for the lowest price.

LIGHT BRAHMAS—AN ERROR CORRECTED.

IN the RURAL of April 13th, Mr. HALES bases sundry arguments, in regard to Light Brahmas being seen in England before they appeared in this country, on an allegation, that "three American shipments of fowls all produced Light Brahmas!" I deny that there were ever imported into the United States any Light Brahmas, except the one pair bought and bred by Mr. CHAMBERLAIN, of Hartford, Conn., in 1847; and I hereby agree to pay one hundred dollars to any man who will prove me to be in error. Now, Mr. HALES, give us the proofs that "three importations of Light Brahmas" were made, being the original stock in this country. Mr. BURNHAM never adduced any proofs of such importations, nor has any other man. He has said a good many things about these fowls that are mere bosh, which I have many times shown to be so. Mr. HALES speaks of my asking, why the fowls claimed to have been in England before any appeared in this country, (1846) were not exhibited at Fairs. I asked no such question that referred to that date, but I referred to 1852 and '53 when poultry shows were in existence.

T. B. MINER.

Linden, N. J.

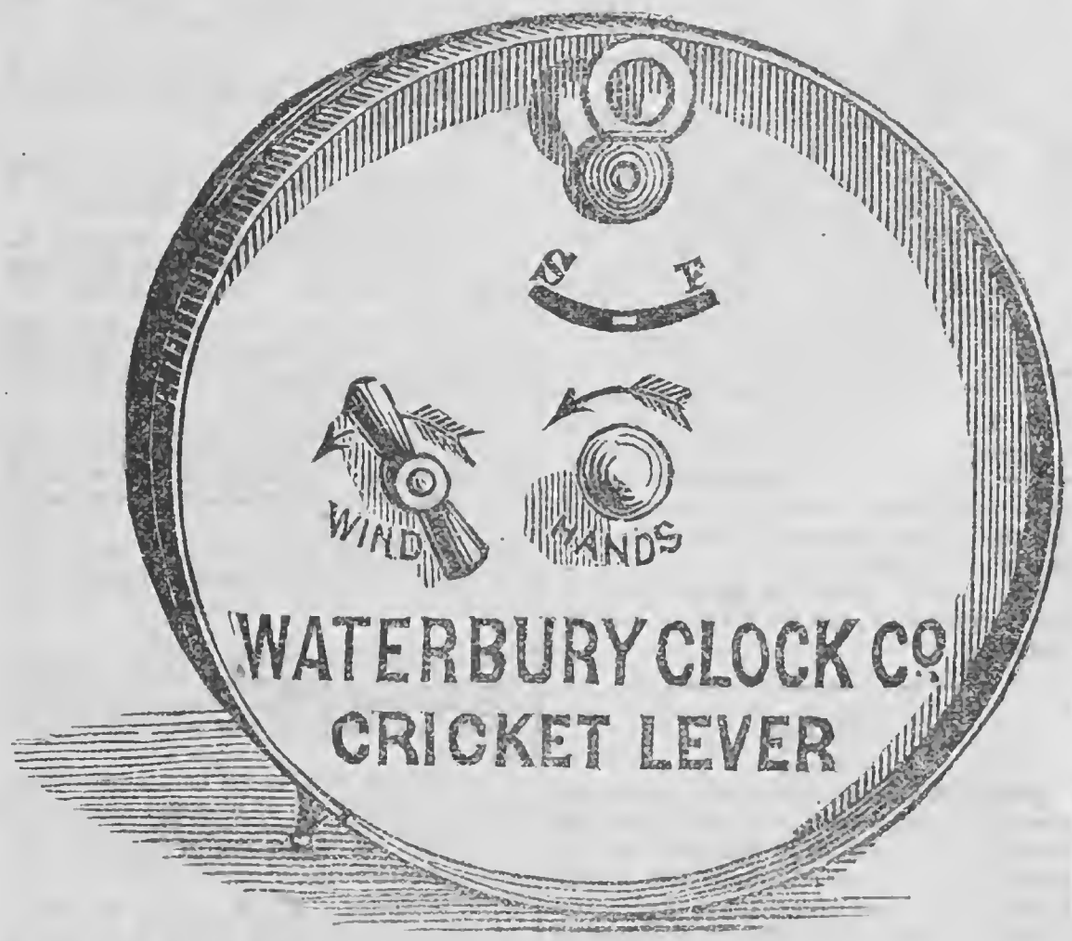
THE MODERN CRICKET ON THE HEARTH

To be Withdrawn the 1st of July.

How to Secure an Elegant Time-piece without Cost and with very little Trouble.

THE OFFER ALL THAT IT WAS REPRESENTED AND MORE.

The Cricket for Two New Subscribers.



IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH,
And May be Carried from Place to Place in a Trunk or Valise.

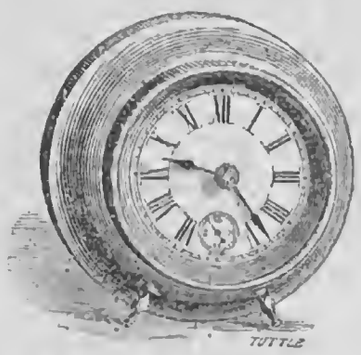
We want the Rural Cricket Clock in the Home of Every Subscriber.

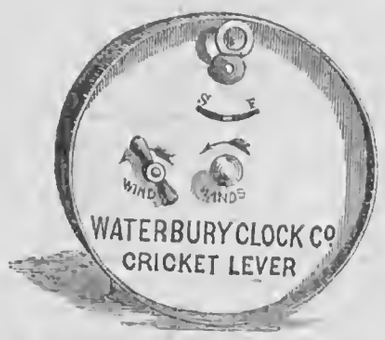
THE MUST BRILLIANT OFFER MADE BY ANY JOURNAL.

To judge by its appearance many who have not seen it before, estimate its value to be ten dollars. We have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, *will be repeated during the present year*. Meantime, the RURAL itself has been enriched in all its departments, by contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

ECLIPSES EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam. It is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.





NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secure the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5.00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

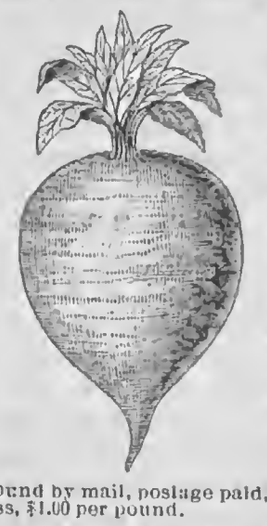
We will send the RURAL NEW YORKER for one year and the Cricket Clock to any one upon the receipt of $3.50.

RURAL NEW-YORKER, 78 Duane St., N. Y.

Trees, Seeds, Plants, &c.

"THE BEST BEET FOR STOCK."

WEBB'S NEW KINVER YELLOW GLOBE MANGEL WURZEL.



Price per pound by mail, postage paid, $1.15; large lots by express, $1.00 per pound.

R. H. ALLEN & CO.,
P. O. Box 376. 189 & 191 Water St.,
NEW YORK.

SANFORD CORN.

Best field corn in cultivation; large, white and hard. 101 bushels per acre last year, common culture. Stalks unequaled for fodder. Seed *carefully selected*. Post free—1 lb., 50c.; 3 lbs., $1; samples, 25c. By express—peck, $1.25; ½ bush., $2; bushel, $3.
H. HENDRICKS, Kingston, N. Y.

LADY GRAPE-VINES.

The finest, perfectly healthy, hardy and reliable extra early White Grape. Also, Brighton, Elvira, Eva, Delaware, Concord, and all other valuable kinds. Small Fruits, Seeds, Trees, and Flowering Plants. Illustrated Catalogues for 3-cent stamp. Address GEO. W. CAMPBELL, Delaware, O.

POMONA NURSERY. 100 acres of Trees, Vines and Plants. *Best Strawberries*, nine inches, *Raspberries*, 3 inches around. Ten acres yielded $4,338. Send for Price-list, free. 40 YEARS Among Small Fruits, telling what and how to plant. Sent post-paid for 20c., *or free to every purchaser*.
WM. PARRY,
Cinnaminson, N. J.

NEW & RARE ROSES.

We offer from our list of over 500 varieties of Roses, Well grown plants from Pots or Field Culture. One-year plants, Hy. Perp., our selection, at $3 per doz., $20 per 100. Teas and China, $2.50 per doz., $16 per 100. Young plants per mail, $1 per doz., $8 per 100. Also the rarest and choicest Evergreen and Ornamental Trees and Shrubs of all varieties for planting in Lawn, Yards, etc.
MILLER & HAYES,
MOUNT AIRY, PHILADELPHIA, PA.

FOREST ROSE STRAWBERRY PLANTS. NOW READY.

This is the *largest, most uniform, healthiest*, most productive bearer yet known *in the world*.
Send for Catalogues. 1, 2, 3, 4. LEO WELTZ,
Nurseryman, Wilmington, O.

GARDENERS!—DO YOU WANT TO RAISE vegetables from two to four weeks earlier? Use Soluble Transplanting Pots! For particulars, how to make them, etc., address, with stamp,
TUISCO GREINER, Naples, N. Y.

Evergreens for Lawns, Cemeteries, and Ornamental Grounds.

Norway Spruce, 3 to 4 feet high, strong and bushy, for shelter belts at very low rates by the car load. Also the largest stock of Nursery grown Evergreen and Forest Tree Seedlings in America. Evergreen seeds. Send for Catalogue. ROB'T DOUGLAS & SONS,
Waukegan, Ill.

A WONDERFUL NEW RASPBERRY.—The New Rochelle produces 500 bushels to the acre; 12 plants will produce two bushels. 1,000,000 Strawberry plants. Crescent Seedling and Great American, $1 per doz. Send for Catalogue. W. S. CARPENTER & SON, Rye, Westchester Co., N. Y.

LOVERS OF RARE FLOWERS. It will astonish & please. Free to address. ELLIS BROS., Keene, N. H.

THE MILFORD BASKET CO. are now prepared to furnish (at *Reduced Prices*) the Square Verbena Basket, Quart, Pint and ½ Quart Berry Basket, with or without crates. Send for price list.
MILFORD BASKET CO., Milford, Del.

Real Estate.

FARMS In the best part of MARYLAND at *great bargains*. For catalogue and prices address Mumchat & Gibson, Centreville, Md.

Agents Wanted.

$350 A MONTH.—Agents wanted. 36 best selling articles in the world. One sample free. Address JAY BRONSON, Detroit, Mich.

$2500 A YEAR. Agents wanted. Business legitimate. Particulars free. Address J. WORTH & CO., St Louis, Mo.

$1200 Salary. Salesmen wanted to sell our Staple Goods to dealers. No peddling. Expenses paid. Permanent employment. address S. A. GRANT & CO., 2, 4, 6 & 8 Home St., Cincinnati, O.

$3 GOLD PLATED WATCHES. Cheapest in the known world. *Sample Watch Free to Agents*. Address, A. COULTER & Co., Chicago.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper* and in Premiums to Agents

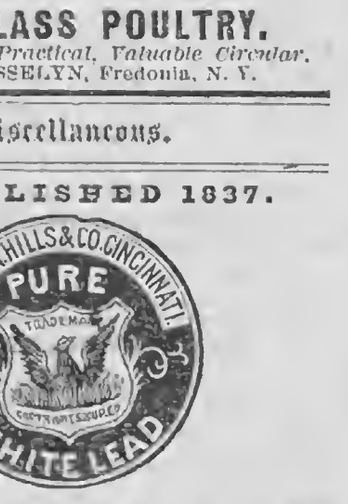
Implements and Machinery.

CREAMERY BUTTER.

The Cooley System of Butter-Making has been before the public but one year, yet over 1,300 Dairies have introduced it. Read for yourself what people say about it who are using it:

OGDEN FARM, NEWPORT, R. I., March 24, 1878.
VERMONT FARM MACHINE CO:
Gentlemen:—We are more and more pleased with the Cooley Creamer as we continue to use it, and we feel confident that we shall produce a better quality of butter this summer by means of it than we ever had before. We are now getting $1 a pound for our butter. Very truly yours, MELVILLE BULL.
Send 3c. stamp for Circular to
VT. FARM MACHINE CO., Bellows Falls, Vt.

The IRON TURBINE WIND ENGINE



Is Proof Against Storm and Exposure to the Weather.
Made entirely of Iron.
NO SLATS
To Break or Blow Out.
Self-Regulating and Perfect
In every particular.
They are giving *Perfect satisfaction* where other mills HAVE FAILED.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, APRIL, 27, 1878.

We have decided to lengthen the columns of the RURAL three-quarters of an inch, and to widen the page in proportion. This will enlarge the paper over four columns. In other words it will be equal to issuing a four-page supplement once in four weeks.

We are already making arrangements for the change, which involves considerable expense, and hope to present the new RURAL to our friends early in May.

SUPERSERVICEABLE FOOLS.

Of that wondrous faculty of discrimination which enables the naturalist to discover such a vast multitude of species and other sub-divisions in animated nature, just a trifle is amply sufficient to determine that of the superserviceable fool there are at least two varieties. Totally disregarding the scientific custom of compounding for each class an abstruse, pollysyllabic name from a dead language, these may be briefly styled, in the plain vernacular, the congenital, and the accidental. To the former, nature, from the moment of his birth, has given a legitimate right to the title of fool, while the claims of the latter to it are due mainly to transient circumstances. Widely, however, as they differ in this particular, yet they possess so many characteristics in common that no one gifted with even the rudiments of common sense, would differentiate them more than as two varieties of the same species. The chief distinctive difference between them lies in the fact that the former is incorrigible, while the latter is capable of reformation. Among the mental peculiarities of both are overweening conceit, incontinence of ideas, and insensibility to the fitness of things.

These they manifest in various annoying ways, in and out of season, but especially out. They are the men—and sometimes the women—who persistently obtrude on others their own notions and ideas of what their conduct should be, in the shape of advice, admonition and information, under the vain delusion that wisdom speaks through their lips and that their hearers will disregard her words at their peril. Let an idea, however crude, find its chance way under their hair, and entirely unable to conceal the novel experience, like a hen with a new-laid egg, they must straightway proclaim aloud the circumstance, attaching to it a value not in proportion to its intrinsic worth, but in accordance with its rarity. In private life they are constantly pressing their views and sometimes their services on their acquaintances in entire ignorance of circumstances on which may often depend the prudence of adopting the one or the possibility of accepting the other. In convention, caucus, or any assemblage met for discussion, jack-in-the-box-like, they are everlastingly springing to their feet with another remark, just a word or two more, or an idea (!) that has just struck them, until their exasperated audience heartily wish that the springs of the childish contrivance were broken and the persistent prattler at rest. It is one of these also who, in company, is forever interrupting conversation by the introduction of subjects foreign to the matter under discussion, but which having just occurred to the thing of his he flatters by calling it a mind, he cannot for the life of him refrain from instantly cackling about.

The congenital variety of superserviceable fools has seldom anything to say worth listening to, is insensible usually to slight or reproof, and incapable always of amendment, and should therefore be promptly squelched. The accidental sort, on the other hand, whose folly is mainly due to want of training, tact and modesty, often has a respectable fund of useful information and opinions, is, as a rule, sensitive to a rebuff, and always capable of improvement—a happy consummation that can be most effectually accomplished by a severe course of instructive snubbing.

ALKEKENGI.

Few who have raised this plant and preserved the fruit as it may be preserved, are indifferent to its culture. It possesses all of the good flavor of the tomato with less either of its acidity or the characteristic harshness which renders it unpalatable to most people when eaten raw. Canned or pressed it rivals the strawberry or cherry, resembling the latter in appearance and possessing a distinct aroma that reminds one of the former, from which circumstance one of its familiar names—Strawberry Tomato—is derived. Winter Cherry, and Barbadoes Gooseberry are other familiar names. It is a hardy annual, attaining a hight of about three feet. It should be cultivated in good soil and treated much the same as the Tomato.

The fruit is the size of a small cherry, half an inch or more in diameter, bright yellow and inclined to transparency when well-ripened. It is inclosed in a papery, membranous, inflated calyx, something like the Balloon-Vine (Cardiospermum halicacabum), of a light green before maturity and a dried-leaf color afterwards. The fruit stem is not strong or persistent, so that most of the fruit fall to the earth spontaneously when ripened.

When this has been raised for one season, plants from self-sown seed appear abundantly the next year if the soil is not worked too early, when they may be transplanted or thinned out as desired.

The fruit is rather small to be gathered in large enough quantities to be served as tomatoes. But stewed, like cranberries, with a little lemon-juice added, or canned or preserved like peaches, quinces, plums or cherries, this Physalis is well worth the little trouble required in its cultivation.

Alkekenzi is really a distinct species that bears scarlet berries, and ought not to be applied as a familiar name for the species of which we have written, which is Peruviana—or P. edulis of some authors. We have never learned that any attempt has been made to improve this fruit by selection, crossing or hybridizing; but the fact that some of the berries are twice as large as others is proof enough that it might be improved by such means.

PERIODICAL SALES.—MARKET FAIRS.—AUCTIONS, ETC.

In all those sections of the country distant from regular markets and not upon or near great lines of transportation, especially in rather sparsely settled districts, all occasions when unusual numbers of people are brought together, are embraced by those who have anything to sell to offer their goods at auction or otherwise. We at the East know very well how it is at "trainings," "musters" "camp meetings" and even surrounding the peripatetic circus and menagerie. At the West and South court days bring the crowd, hence these are the times made the most of by the auctioneers and other venders. In some cases periodical sales have been established in conformity with this custom, or tendency, or necessity of the people to come together upon court-days, and have had some success. We do not know particularly about those sales or Market Fairs and would be glad to hear directly from those who are familiar with them and their management.

There have been a good many attempts made to establish Market Fairs in New England, and perhaps in the Middle States, but though apparently well organized and fairly conducted they have not proved successful, the reason being that communication with great market centers is too easy, and every seller hopes for better prices, not putting his wares or cattle or products fairly upon the market to be sold at the best price he can get. The only way to make any such sale a success is to have every article absolutely sold, as if the auctioneer or the seller were under orders from the sheriff, and the goods were surely to go for what they would fetch.

The above is given in answer to several inquries which we have of late received.

NOTES.

Barn Notes.—We must be careful nowadays while the barn-yard is wet and mussy, or a great deal of fodder will be wasted. It is now too late in the season to feed straw, but plenty of it will be required for beds. The calves and young animals must be kept clean if they are expected to be healthy; a foul stable will cause a young thing to lose its appetite. This is one of the common failings on a farm; to put off cleaning stables; and it is a most unprofitable form of shiftlessness. It makes pigs scurvy and lays the foundation for mange; it gives calves the diarrhea and makes sheep and lambs sick. The cows are suffering for lack of the curry-comb and brush; soap-suds and a sponge are needed back of the horns and on the withers and on each side of the tail, to clean out the dirt which has accumulated. The cattle cannot reach these places themselves—hence they should often be cleaned. The itching must be almost intolerable and if the cattle could speak after a good currying and sponging there would be loud-spoken thanks.

A Pretty Contrast is that which the Golden-leaved Spiræa and the Purple-leaved Filbert present when planted side by side. The leaves of the first, in this earliest of springs, are nearly unfolded and their color is bright yellow. The leaves of the second are a dark purple. Both plants are before us as we write and we wish we could describe their charms so that the reader could see them as they appear to us. He would add them to his spring orders, even though he were obliged to go without tea and coffee for two weeks as a penalty, which deprivation would probably pay for the cost. The botanical names are Corylus Avellana atropurpurea and the Golden Spiræa (Neillia) opulifolia.

Death to the Curculio.—We are informed by one who has tried it, that if a small quantity of salt is sprinkled under the plum trees just as the fruit is forming, it will kill the curculio and prevent the young plums from being stung. The same person says wood-ashes spread underneath the plum trees will also drive the curculio away. He applies both of these remedies and always has nice smooth plums and a bountiful crop. Perhaps both are effectual; the ashes will, at least, promote a vigorous growth, and the salt can do no harm if it is used sparingly.

Mexican Black Sweet Corn.—There are two objections to this corn. One is the size of the ears. They will not average over seven inches. The other is the color of the kernels which, when mature, become a dark-slate or lead. But when first fit for use, the color is as white as that of other varieties of sweet corn. The plant grows about five feet in hight. The ears are eight-rowed and the kernels much shriveled when mature. For sweetness; however, for buttery richness, we prefer it to any other variety of sweet corn we have ever tried.

BREVITIES.

Arsenical candor is prevalent.

Do hay elevators raise the price of hay?

Is it easier to prevent or to destroy weeds upon the farm?

Col. Curtis says that "Milk makes big, fat lambs—our fathers to the contrary."

Mr. Idell thinks "Beauty" the gem of Mr. Durand's noted seedling strawberries for amatuers.

In selecting trees and shrubs, be careful to select those which are hardy in the climate for which they are selected.

It seems to us that a very effective political party might be organized upon the basis of opposition to the postal laws of our country.

The Agricultural Gazette of England defines a tramp to be "a laborer who has degenerated in the absence of capital and work" (!)

"Among many jewels," says Mr. H. B. Ellwanger, "Catherine Mermet, Marie Van Houtte and Marechal Niel are the fairest of the fair." He is talking about Roses.

The farmer is always ready to stand and talk an hour with a neighbor or friend, even in his busiest season. The merchant that would do this would be considered a poor business man.

Magnolia Lennei is at this date (April 21) blooming in the Rural Grounds. The petals are, outside, of a claret-purple, and inside nearly white. Last year this Magnolia bloomed May 15.

Mrs. Myra Clark, Gaines apropos of Woman Suffrage: "The method you employ makes the very thought of suffrage obnoxious to men, and women, too. It is too foolish." Who will Gains-ay her?

It is well at this season that every farmer should impress upon his mind the necessity of so managing his children that they shall grow up to take a deep interest in all matters appertaining to the farm.

Dr. Pendleton says: Numerous experiments have clearly demonstrated that the proper application of nitrogen with soluble phosphate of lime will restore these soils (Georgia) up to and above their pristine fertility, at least in the production of cotton.

According to Schloesing and Muntz, nitrification is no mere chemical process. It is the work of a living organism which thus acts in bringing about a chemical change, just as the yeast-plant does in promoting the fermentation of saccharine solutions.

It should be borne in mind that every farmer who will take the trouble to keep up a tasteful appearance about his house, not only performs a good work for his own family, but stimulates his neighbors to imitate him. Nothing is more contagious than the desire for gardening when once it gets a footing.

After awhile we shall settle down not to think so much of size in potatoes as we are wont to do. We should bear in mind that perfection of form, smoothness and color of skin depend upon the soil. A sandy loam, well cultivated and manured with phosphates and potash, are what the potato needs.

One of the objects of pruning is to induce trees to take on unnatural forms. Those who consider that a certain amount of pruning *must* be done and who go forth in and out of season with pruning knife in hand, are invited to study the above definition before they begin their ofttimes needless and destructive work.

The soil of the onion beds cannot be stirred too often. There is no success without weeding thoroughly. No crop is surer to the experienced, careful propagator; none more uncertain to the beginner, than this. Better for the latter to gain his first practical knowledge by small ventures, or to place himself under the direction of those competent to instruct.

Secretary Garfield answers the question "Why should we beautify the home grounds?" thus: First, for the beauty itself. Second, for what beauty will effect in man. As results flowing therefrom he notes: (1) an added refinement; (2) a satisfaction of possession; (3) developement of a new set of faculties; (4) an exhibition of benevolent spirit; (5) a higher appreciation of the created things of God.

Mr. Hance, chairman of the Fruit Committee of the New Jersey State Horticultural Society, among the newer strawberries mentions the following as promising well. Forest Rose, Cumberland, Triumph, Duchess, Prouty's Seedling and Sterling. The Raspberry season commenced with Highland Hardy, and in the order named by Doolittle's Black-cap, Miller's Early, Mammouth Cluster, Brandywine, Winant, Philadelphia and Cuthbert.

The following are the names of the strawberry plants which we are this season testing in the Rural Grounds. We make no mention of a number of new seedlings varieties not yet offered. Duchess, H. 75., Pres. Lincoln, Beauty, Great American, Duncan Kerr's Prolific, Triumph of Cumberland, Sterling, New Dominion, Harrington's Market, Prouty's Seedling, Belle de Lyrons, Donaldson's Seedling, Golden Defiance, Cap. Jack. Most of them fruited with us last summer, though as they were planted in the preceding spring or fall, it would have been unfair to judge of their merits.

Literary Miscellany.

THE EVENING TIME.

TOGETHER we walked in the evening time.
Above us the sky spread golden and clear,
And he bent his head and looked in my eyes,
As if he held me of all most dear,
Oh! it was sweet in the evening time!

And our pathway went through fields of wheat;
Narrow that path, and rough the way,
But he was near, and the birds sang true,
And the stars came out in the twilight gray.
Oh! it was sweet in the evening time!

Softly he spoke of the days long past,
Softly of blessed days to be;
Close to his arm, and closer I prest—
The corn-field path was Eden to me.
Oh! it was sweet in the evening time!

Grayer the light grew, and grayer still,
The rooks flitted home through the purple shade,
The nightingales sang where the thorns stood high,
As I walked with him in the woodland glade.
Oh! it was sweet in the evening time!

And the latest gleams of daylight died;
My hand in his enfolded lay:
We swept the dew from the wheat as we passed,
For narrower, narrower, wound the way.
Oh! it was sweet in the evening time!

He looked in the depths of my eyes, and said,
"Sorrow and gladness will come for us, sweet;
But together we'll walk through the fields of life
Close as we walked through the fields of wheat."

[*Good Words.*

MR. CHETWOOD'S WILL.

J. H.

"BUT, Dolores, how's a fellow to live if he hasn't anything?"

"You knew all that a year ago, Guy; and William told you how it would be."

"William is an old screw," was the impatient rejoinder; and Dolores made no answer.

Sitting by the fire, brother and sister had had a long conversation on that wintry afternoon, and it was getting quite dark now—so dark that even the shabbily-furnished room looked quite cheerful, as the firelight flashed and flickered on the walls and on the fair face of Dolores Chetwood, sitting on the hearthrug, with great wistful eyes looking into the burning coals, Guy looking into the fire too, with his chair tilted back and a cigar between his lips.

"If you didn't smoke, Guy," began Dolores; but he interrupted her, bringing the fore-legs of his chair down to *terra firma* again abruptly.

"Hang it all, Dolores, I can't give up everything!"

As yet Guy Chetwood had not given up anything, but he liked to talk as if he had.

"It was a great pity you ever thought of the Army at all," said Dolores, a little bitterly. "Every one said nobody could live nowadays on ninety pounds and their pay."

"Every one is a fool! And pray what is the difference between nowadays and thenadays? Why, Dolores, you are turning on me now, I do believe!"

"You are all I have, Guy"—and she looked up at him brightly—"and we must never turn against each other."

"Of course not. Where's William?"

"I don't know; he went into the town, I think."

"To minister stern consolation to the afflicted," said Guy. "William, parson though he be, is the last man on earth I would go to in trouble."

Dolores said nothing; she had no great love for her step-brother herself, partly because he was hard on Guy, and partly because, child though she had been then, she knew and remembered how William had always disliked her own mother. Father and mother were both dead, and to William Chetwood the name of "mother" never passed Dolores' lips; she could not bring herself to speak of the dead he had never loved through life. And yet he was kind enough to his step-brother and step-sister, and had done his duty by them conscientiously. All his life through he had been hard on Guy; he rather disliked the boy, who was high-spirited and too like his mother, who had come between him and his father. He rather liked Dolores, and respected her from the day, long before, when upon one occasion he punished Guy unjustly, and Dolores wound her weak, childish arms around her brother and exclaimed, with passionate earnestness and a look in her eyes he never forgot:

"William, Heaven is just; a servant of Heaven ought to be just too."

Guy was twenty-one, and Dolores eighteen; he had been in the Army for two years, and had seen and tasted the pleasures the world could give, and she had lived all her life in the dull little country town, and was sometimes a little discontented—that was all. But Guy was home on leave now, and it would have been cheerful enough, but that the young soldier had been living a little too fast, and debts were beginning to be felt. The first cloud was leaving its mark on the freshness of his bright boyish face, and Dolores thought Guy was changed; he was not so gay and light-hearted as he had used to be. They had had a long talk that afternoon, and he had told her a good deal, but not all. Dolores opened her blue eyes.

"Oh, Guy," she said, with a little gasp; and he answered, sulkily—

"One must do what other fellows do; I couldn't isolate myself and live like a hermit."

"I wish I had plenty of money," said Dolores.

"It doesn't so much matter for girls," said Guy, "They marry—at least the pretty ones do."

"And what happens to the ugly ones?"

"Oh, you've nothing to do with that!" replied Guy, looking down at his sister's upturned face. "You are pretty enough for anything, Dolores. Why, when we were quartered in Dublin last winter, they were raving about girls not one half so much the thing as you."

"Oh, nonsense, Guy!" And Dolores flushed up to the roots of her hair at her brother's praise.

Guy was right, though. Many girls would have envied the fair face that was lit up by the soft violet eyes that looked dreamy and wistful through their long lashes. Very slight and delicate-looking was Dolores Chetwood, with a low, soft voice, and silky brown hair that lay soft and even on her white forehead.

Guy returned to his own woes. He was going back to his regiment soon, and he was sadly out of pocket. Presently Dolores took a long look at his handsome, troubled face, as she sat gazing morbidly into the fire; then, with a little sigh, she got up, and, going over to the table, unlocked her desk and came back to the fire with something in her hand.

"Guy, dear, would this be of any use to you? I have saved a little—only ten pounds, though."

When sixpences had been all Dolores's pocket-money, they had found their way into Guy's pocket—and it was just the same now. A passionate remonstrance on his part, a little persuasion from Dolores, and there was no chance of the new silk dress she had been saving for, and Guy was the richer by ten pounds—and she loved him so that she thought nothing of the sacrifice.

"You aren't going to uncle Hal to-night, are you?" said Guy, presently.

"Oh, yes, I promised him!" said Dolores, jumping up. "You will walk with me to the door, won't you, Guy?"

"If you like; but how can you waste your time with that cross old man passes me. If he had money, it would be different."

"Don't be so mercenary, Guy."

"Nonsense. If uncle Hal had anything to leave, he would be much better worth looking after. Does he ever say a civil word to you, Dolores?"

"Sometimes. Poor old man, he suffers a great deal—and that makes him cranky."

Dolores was soon dressed and ready.

"Put something more on you," said Guy, standing in his thick great-coat, and looking down at his sister's thin jacket.

"I am warm enough. Come, Guy, it is late."

Down the little street they went, and stopped at a small house at the other end, a dreary, two-storied house, with the light from the fire within flashing upon curtainless windows.

"Look at him," said Guy. "He is sitting by the fire. Dolores, I don't envy your taking tea with that old chap."

Through the window, in the firelight, the figure of a tall old man could be seen bending over the fire, holding out his hands to the blaze.

"How dreary he looks!" replied Dolores. "Don't forget to call for me, Guy. Come at nine."

"All right." And Guy went humming up the street as Dolores disappeared within the door, which was opened by an old woman with a candle in her hand.

Nobody ever knew anything about old Hal Chetwood, as he was called; none in the parish of Kiblaney could tell how he lived, or what he did all the long days. A strange, sour, crabbed old man he was, with never a kind word for any one—not even for his niece Dolores Chetwood, who bore with him patiently, and somewhat had got to have a kind of liking for the poor cross-grained old man. He was crosser than ever this evening, and was bitter and cynical to a degree.

"I wonder you come to an old man for nothing," he said, peering over his spectacles as they sat by the fire after tea. "Guy doesn't trouble his head about me. He is a nice boy, isn't he?"

"He is no worse than others, uncle Hal," returned Dolores, flushing up in hot championship of her brother.

"I knew it; he is perfection of course, if all William says is to be believed;" and the old man laughed softly to himself, in a sneering sort of way.

Dolores lifted pleading pathetic eyes to the hard cynical face opposite to her.

"Guy is all I have, uncle—could I be hard on him?"

The soft girlish voice quivered a little. Mr. Chetwood, leaning forward, his hands resting on his knees, looked keenly at her for a full minute before he spoke.

"You would make any sacrifice for him, I suppose, child?"

"I don't know," Dolores answered, gravely; "but I would do all I could for him, and he for me."

"I doubt the last part of your speech; from the little I have seen of that young gentleman, I doubt it exceedingly."

Dolores made no reply, but only closed her lips tightly and sat silent, the firelight shining in her eyes. Mr. Chetwood changed the subject abruptly.

"I have a friend coming to me to-night from London—I expect him every minute; he telegraphed to say he would cross over by this morning's boat from Holyhead."

Dolores looked up in amazement. A friend coming to see uncle Hal! She did not know he had such a thing in the world. Mr. Chetwood went on, talking quite eagerly, for him.

"He is coming for a purpose, this Brian Mannering, his father was the only friend I ever had. When we were lads we would have died for each other, till a woman came in the way. You are a child; you can't know why I never spoke to my old friend Brian Mannering after he won the woman I loved. I never saw him again; he was killed in the Mutiny in India, and so was she, and his last words were—'Tell Hal Chetwood to look after my boy.' A brother-officer of his, who escaped, gave me his message. But, Heaven bless me, that is years ago! Brian was at school then—he is thirty now. Time I was looking after him, eh?"

The old man told his story in short jerks. Dolores, listening, pitied him, for she fancied that that little glimpse into his past life showed her why his heart was hardened against the world.

"He ought to be here now," said Mr. Chetwood, looking up at the shabby little clock ticking on the chimney-piece; and even as he spoke a car was heard driving up the street and stopping outside. A loud ring went pealing through the house; and then the door opened, and Dolores, looking up, saw a tall man entering the room, enveloped in a long ulster coat—a man with a dark rugged face and a short brown beard; and, as he came forward smiling, she caught a glance from a pair of pleasant gray eyes. Mr. Chetwood held his visitor's strong brown hand in his long white fingers, and looked him full in the face.

"You are welcome, Brian," he said, slowly. "I haven't seen you for ten years, lad, and time is telling on us both."

Brian Mannering laughed a real mirthful laugh.

"You are looking first-rate, Mr. Chetwood—and I am not gray yet!"—putting up one hand to his thick, short brown hair.

"Dolores," said Mr. Chetwood, "this is Mr. Mannering—Brian, my niece."

"I have heard of you before," observed Brian, smiling, and looking down with his pleasant eyes at the shy girlish face; and Dolores, as he clasped her hand in his, wondered where he had heard of her, and when. Her brief questioning glance told him her thoughts, but he only said, "And your face is what I thought, only——"

"Only what?" asked Dolores, laughing a little as she met his friendly glance. He laughed too.

"I will tell you another time," he said—"when we know each other better."

"What sort of passage had you, Brian?" inquired Mr. Chetwood, abruptly. "Was it rough?"

"Not very. We got into Kingstown in good time."

"You'll sleep here, Brian—your room is ready."

"Thanks; but I have sent my traps down to the hotel."

"As you please; you would only have been uncomfortable here."

Dolores, sitting silent, wondered who Brian Mannering was, and what was the purpose he had come all the way to Kiblaney. Looking up she encountered his gray eyes fixed half quizzically on her, but the smile changed to earnestness.

"Do I puzzle you very much?" he whispered, leaning his elbow on the chimney-piece and looking down at her.

"How do you know what I am thinging of?" said Dolores, coloring.

The clock on the chimney-piece struck nine, and was answered immediately by a great clock in the bare hall which boomed out the hour, echoed by another somewhere in the region below-stairs, and a few minutes later two more clocks pealed out nine in shrill trebles. Clocks were a perfect mania with old Mr. Chetwood, but Dolores always shuddered as she heard them tolling out the hour through the empty house. She got up now.

"Guy was to call for me at nine. Good-night, uncle Hal."

"Good-night, child"—taking her hand in his. "So Guy is to meet you, is he?" and again the sneering smile came about the corners of his mouth.

Dolores' hat and jacket were in the hall, and she went to fetch them. Brian came out with her, and Dolores, standing in the light of the one dip-candle sputtering and flickering on the table, held out a shy hand to say good night. There was more pity than amusement in his eyes this time, as he clasped her hand with a friendly pressure and said good-night.

Guy was waiting outside smoking, with his hands in his pockets. He started as he saw the tall figure of Mr. Mannering in the doorway.

"Who is that fellow?" he asked, as Dolores joined him. "By Jove!" he ejaculated, when she had finished her story. "I wonder where he comes from."

"Well," said Mr. Chetwood, impatiently, as Brian came back slowly into the room, "what do you think of her, lad?"

Brian looked thoughtfully into the smouldering fire.

"I think, Mr. Chetwood," he said slowly, "that you ought to reconsider your decision."

The old man's eyes glittered.

"I won't," he said, and then added, "Are you disappointed?"

Brian lifted his eyes frankly to Mr. Chetwood's.

"No—only it's very hard on her, poor little thing."

"She's pretty, isn't she?"

"Yes," was the brief rejoinder; and then there was silence between them. Mr. Chetwood was watching the man's face opposite to him, wondering what he was thinking of as he sat smoking thoughtfully. "Mr. Chetwood," he said suddenly, "do you think you are right in this?"

"I think I may do what I like with my own," was the answer.

"And if I won't keep to my part of the agreement?"

"You must, Brian; you wouldn't be such a fool."

"It shall never be against her will, any way," said Brian, in a low voice; and, getting up, he paced up and down the dimly-lighted room, with his head bent and his eyes fixed on the carpet, for fully five minutes without speaking; then he came back to the fire again, and stood in his old attitude, with one elbow on the chimney-piece. "Your proposition is unfair and unjust," he said; "it places us both in an awkward and disagreeable situation. For the sake of right and justice you ought to change your decision."

There was a kind of quiet earnestness in his voice and manner that ought to have carried conviction of the truth of his argument. But old Mr. Chetwood was not like other people; he stood up when Brian had finished, and laid one hand on his broad shoulder, looking straight into the steady gray eyes regarding him.

"If you talked all night, Brian Mannering, it would make no difference; no argument you could bring forward would shake me one bit."

"For my mother's sake!" said Brian, in a low, deep voice. "If you have no pity for that child who was here to-night, do what is right and just for the sake of my mother's memory."

But harder grew the stern old face looking so fixedly into his own.

"No," he said, slowly; "not even if your eyes were ten times as like hers. Good-night, Brian; you have upset me, lad."

They shook hands, and Brian left the house and walked slowly down the empty street, where nothing but the echo of his own footfall was heard as he wended his way to the hotel, as it was called. But it was long before he went to bed; he sat smoking and thinking till the night was well-nigh morning.

* * * * * * *

It was the day of Guy's departure; he had left that morning after breakfast, after a stormy interview with the Reverend William, who expressed his mind pretty freely, without stopping to weigh his words, or soften any of the hard things he felt it was his duty to say to the hot-headed young fellow who faced him in his study with no sense of regret for the errors he had committed and the debt he had fallen into, but only exasperated beyond measure by William's stern reproofs and still less welcome advice.

"You must mend your ways and give up all your extravagances, or——"

"Or what?" burst out Guy, hot and passionate.

"Or I will stop your allowance," was the withering rejoinder; and then they parted with a cold hand-shake, and Guy, angry and agitated, went to say good-by to Dolores.

"Guy darling," she sobbed, as he held her in strong young arms, "you will be prudent for my sake—won't you, Guy?"

"I will try, Dolores—I will indeed. Good-by, dear; don't cry. I will give up smoking, or anything in reason; there—I promise,"

With tearful eyes Dolores stood at the window and watched him going off, sitting on the car and looking back smiling to the loving face watching him; and then William came in, with a stern look on his hard features, and repeated what he had said to Guy, and more besides, to Dolores, who defended Guy and gave way to tears.

"It is all your fault, Dolores; you encourage him in everything, and you are as much to blame as he is. From a child you have taught him to set my authority at naught; and when he goes to the dogs you may blame yourself."

And William, having given vent to his feelings by a just exhibition of his wrath, left the room again, leaving Dolores to spend a long, unhappy day. It was the afternoon now, and the red sun, golden and hazy, was sinking behind the town. Dolores was sitting in the window that looked out on the straight, narrow garden, bending over her work, turning and remaking a dress. She was very miserable, and tears rolled down her cheeks and fell upon her hands.

It was three weeks since the night when Brian Mannering had so unexpectedly arrived, and whenever she went to Uncle Hal's he was there too; and then Dolores had left off going, and had spent that last week all with Guy. William's speeches that morning were still rankling and smarting, and she was feeling very disconsolate indeed, when the door opened and Brian Mannering was shown in to see Dolores, her hands over her face, sobbing piteously. He was touched at the sight of her distress, and yet, when, covered with confusion, she brushed away her tears and stood up, all her work slipping off her lap and lying at her feet, he only took her hand and held it for a moment, never looking at her downcast, quivering face, and then gravely gathered the scattered reels on the floor, and laid the dress she had been busy with on a chair, giving her time to stop the sobs that were coming with every breath.

"You must miss Guy very much," he said, gently.

Dolores lifted her wet eyelashes and looked up at him gratefully.

"Yes," she replied, with a little sigh. A gleam of the setting sun touched her hair and lay across her sad face.

"But you mustn't fret," said Brian, standing back in the shadow, so that only the outline of his face was visible, and looking keenly down at the sad, wistful eyes gazing out at the garden in the sunlight. "Brothers cannot be always at home, you know."

"I know." And Dolores smiled at his simple, honest words.

"Can you come down to Mr. Chetwood?" he asked, presently. "He is not very well, and he wants to see you."

"I will come now," said Dolores, wondering a little why he spoke so gravely; and she went away to dress, leaving him standing in the window, from which the bar of sunlight had faded.

"Where is he?" Dolores asked, as they entered Mr. Chetwood's house.

"Up-stairs. He did not get up at all to-day."

"I will go up to him now."

"Stop one moment," he said, laying his hand over hers as it rested on the balusters and then

suddenly withdrawing it. "No—go up to him; it is better as it is."

Dolores looked wonderingly into his face, which was strangely agitated, but he turned away, and she went slowly up the uncarpeted stairs and knocked at Mr. Chetwood's door.

"Come in," he said; and she went in and up to the bed where he lay in the twilight. "You have come," he went on. "Good. Get a candle, child, and put it where I can see you—I have a great deal to say to you."

Dolores got the candle and placed it on the little table at his side, his eyes restlessly following her every movement.

"There, that will do—sit down." A roll of paper lay on the bed, Mr. Chetwood took it up. "Read this," he said—"it concerns yourself."

Dolores opened the paper, read a few lines, and looked up surprised.

"Go on," said the old man, impatiently; and Dolores read on with a changing face.

It was the draft of her uncle's will, leaving her and Guy fifteen thousand pounds each, upon one condition—that she, Dolores, was to marry Brian Mannering within a year's time; if not, the whole thirty thousand pounds went to him. What did it all mean? Had old uncle Hal gone mad? Dolores lifted a very white face and looked at him, but did not speak. No word came from her trembling lips.

"I am not mad," he said—"I am as sane as you. Now listen, Dolores Chetwood, and don't interrupt me. I have thirty thousand pounds to leave to whoever I choose. You all thought me a beggar but I am not. Well, as you see there, I have made ample provision for you and Guy. It all rests with yourself. That will is to be sealed up and not opened till a year after my death, and then, if you have not fulfilled the condition therein, all the money goes to Brian Mannering. Now you may speak."

Dolores clasped her hands together, while her breath came fast.

"Uncle," she said, speaking in a very uncertain voice, "of course you may leave your money to whom you choose; but you are not just."

"Possibly not. Well, it all rests with you. Don't look so scared, child, I am sure Guy won't be sorry to get fifteen thousand pounds down." Keenly he read the girl's white agitated face, and noted the trouble in her eyes as he spoke. "If you care for Guy," he said, "you will do what I wish. Brian——"

The blood surged over Dolores's face; tears started to her eyes.

"Does he know of this? Oh, uncle, you are very cruel!" And then came a sound of bitter weeping, and amid her choking sobs Dolores heard Mr. Chetwood urging her to give a promise, but made no answer.

The moonlight was lying in white patches on the bare wooden stairs when Dolores came slowly down, with sad, weary steps. She had crossed the hall, and her hand was on the lock, when the door of the dining-room opened, and Brian Mannering came out and quietly took her hand in his own.

"You are not going like this," he said. "I want to speak to you."

"No, no!" cried Dolores, in a broken, troubled voice. "Oh, please, I must go indeed!" But the strong hand held her fast, and there were wondrous pity and tenderness in his low manly voice when he spoke.

"Only hear me for one moment. I know what you are feeling and suffering now. And Heaven knows, poor child, how I pity you. I have fought against this will. I asked him to let me arrange things in my own way, but all to no purpose. And now"—bending low, to try to see her face in the moonlight, while his voice grew as agitated as hers—"would it make it any easier for you to do as he wishes, not for Guy, not for the sake of the paltry money, but for my sake, because—because, Dolores, I love you?"

"No, no, no!" she cried, wrenching her hands from his clasp. "Oh, please let me pass!" she added, in a voice of such anguish that he cried out—

"Heaven forgive that old man for the wrong he has done us both!"

He caught a glimpse of her white face as he opened the door and they went out into the cold moonlight, he walking by her side, listening to the sobs that could not be repressed, and looking down pitifully at her.

"Don't let this distress you," he said, at last. "Dolores, I have brought you nothing but pain and trouble."

"It was not your fault," she answered, in a low voice, and she held out her hand as they reached the house. "Good-bye."

He held it tenderly, the poor hand that trembled as it lay on his own.

"Is it good night or good-bye?"

Dolores turned away with a little pitiful gesture that pained him.

"Good night," he said. "Heaven bless you!"

Next day was Sunday. Dolores had a headache and did not go to church in the morning, and William went to inquire after old Mr. Chetwood; the old man would not see him however—William was no favourite of his—and it was Brian Mannering who told him Mr. Chetwood was very poorly.

Afternoon service was at half-past six; it was always very badly attended, and the candles flickering from their tall candlesticks shed their light generally on empty seats. William did all the service himself in the evening and preached; the Rector, living four miles out of Kilblaney, did not drive in a second time on cold winter nights.

The service had commenced when Brian Mannering entered the church and took his seat. Looking across the aisle, he could see Dolores' profile bent over the prayer-book in her hand, and he did not pay much heed to the sermon; his gray eyes were forever straying to the pew where Dolores sat with sad, weary eyes looking up at the preacher's face. Brian sighed. Did the knowledge of his love make her look like that? He looked straight before him for the rest of the sermon; and when he lifted his head after the brief prayer that followed the blessing Dolores was gone. He did not try to overtake her, but turned and went through the churchyard, where the moonlight was lying white and cold upon the graves. A figure was kneeling on the grass, leaning in an agony of weeping against a white head-stone.

"Mother, mother!" he heard; and at the sound of that voice he came forward and laid one hand on the bowed head.

"Dolores," he said, very gently, "may I not comfort you here by your mother's grave?"

"Mother, mother!" cried the broken voice, wildly, the weeper laying her head against the marble stone, and sobbing as if her heart would break.

Brian waited for a few minutes and then sat down at her side.

"Oh, go!" pleaded Dolores, turning a piteous face to him in the white moonlight; and he answered, almost sternly—

"Not till I tell you what I have come to say. You must hear me."

"Very well"—moving a little way from him—"only I don't know that anything you could say could make any difference"—looking away beyond the tombstones, a sort of desperate expression coming over her face.

"Do you think I had any hand in Mr. Chetwood's will?" Brian asked.

Dolores turned her head, and looked into the straightforward honest eyes.

"No," she answered.

"You are right," he said; "and, Dolores, Heaven knows I don't want to force you into a marriage with me—on the contrary, I tell you I would never make you my wife unless I knew you loved me. But I want to say to you here now, so that it may all be plain between us, that I love you fully and entirely for your own sake."

But to all Dolores made no answer, she had stood up, and he got up too, and walked beside her. "He wants to make me his wife out of generosity," she kept repeating to herself; and at last she spoke, bitterly—

"Why talk of all this now? Uncle Hal may live longer than either of us."

"Dolores, I tell you," said Brian, passionately, "you are misjudging me. Before Heaven I swear that Mr. Chetwood's money has nothing to do with it; and yet you willfully misunderstand me."

"I understand you very well," she returned, looking up at him wearily, and putting her hand to her forehead. "You are very good; but we can never be any more to each other than we are now."

"Why?" came short and stern from his firm-set lips.

Dolores made no reply; she would not say to him, "I will not be your wife, because you ask me out of pity," for she knew he loved her well; and he repeated his question, adding gently—

"Tell me, Dolores."

She answered him then, bringing out the words bravely enough—

"Because you would all your life think I had married you for Guy's sake."

"My darling, must this separate us? Oh, Dolores, could you not get to care for me?" There was a short, sharp struggle with herself, and the girl's white face was turned to him.

"No," she said, simply, and she held out her hands. "Please, oh, please say no more!

He caught her hands, and held them fast.

"Be it so. Good-bye, love, good-bye!"

The next morning Brian Mannering left for London; and when Dolores went to see old Mr. Chetwood she found him very bitter against Brian and a little more gentle than usual with herself.

"You look out of sorts, child," he said, in a voice quite kind for him; and then he added half to himself, "Blood is thicker than water after all." And after that Brian Mannering's name never passed his lips; and so the spring crept on.

One day Dolores received a letter from Guy, which, in her pleased surprise, she read aloud to William.

"I have a piece of news for you," he wrote. "I have discovered a hidden talent that necessity has called into being. Only fancy, Dolores—I have taken to authorship! and an obliging editor, who sees my productions in the same light as I do, buys them from me. And who knows what I may come to some day? It's awfully jolly. I have given up smoking and everything; and the first thing I mean to do is to send you the jolliest present I can get."

Dolores looked up with glistening eyes,

"I am so glad. Dear old Guy? I knew there was plenty in him. I wonder what he writes—Don't you William?"

The Reverend William looked gravely at Dolores' pleased, excited face.

"Something for a sporting paper, no doubt. That kind of thing would be in his line."

"I thought you would have been so pleased, William," said Dolores, reproachfully.

"So I am—very glad he can do something for himself. He won't be so hard on you now."

With burning cheeks Dolores put away her letter—William was always so unjustly hard on her darling Guy—and from that day she told him no more of Guy's literary success; but when a gold locket came from Guy, with a photograph of himself inside, she showed him that, with such conscious pride and love for the giver that William said, bitterly—

"I should be a happier man, Dolores, if any one loved me as you do Guy."

* * * * * * *

A day came that old Mr. Chetwood was summoned to go on the last long journey, and the blinds were drawn down, and crape hung from the brass knocker on the shabby door—for the old man lay dead up stairs. As he had lived so he died—unloved, unregretted. Dolores was with him at the end. Hers were the only eyes which shed tears over the poor, lonely old man. He held fast to her warm, soft hands in the last awful clinging grasp; it was her voice that whispered of peace and forgiveness, and she alone heard his last words. To the surprise of every one, Brian Mannering came all the way from London for the funeral, and after that the will was read.

"Poor old man," said William, as the lawyer unfolded the paper, "he had'nt much to leave; and he cast a glance round the barely furnished room.

A strange expression flitted across Brian Mannering's face.

"I think," he remarked quietly, "you will find yourself mistaken." And then he leaned back in his chair, with his arms folded across his broad chest, and watched the surprise dawning on William Chetwood's face, when the dry, dusty little lawyer read out, in a high-pitched, squeaky voice, that to Dolores Chetwood was bequeathed the sum of thirty thousand pounds.

"Is it true?" gasped William, turning very white. "I had no idea—I thought my uncle was a poor man."

"Yes," said Brian, bitterly—and his eyes were hard and stern—"the world neglected the poor old man—all but your sister; and it is very right she should have all."

"She ought to be told. Come, Mr. Mannering, and be the bearer of this good news."

Over Dolores's face came a great look of sorrowful surprise and agitation when William told his news, with Brian standing gravely by, watching with keen observant eyes. Dolores looked up at his face, her own very pale.

"This is your doing," she said.

"Yes. I insisted on justice being done," he answered, and he turned away with eyes dark with pain; for was there not an insuperable barrier between them now—a barrier placed there deliberately by his own hand?

William had gone to his study to get over his surprise at Dolores' good fortune, and she and Brian were alone together.

He, standing looking out of the window, watched a string of carts piled up with turf winding their slow, weary way down the street, not thinking of the things his eyes mechanically saw, but wondering what was passing in the mind of the quiet figure at the table, sitting so still, with her head laid down upon her folded arms; and then he heard the sound of low, convulsive weeping that made the blood rush to his forehead. And yet he did not speak—he only bit his lip and looked out steadily into the blazing sunny street. And then William came back, and the opportunity was gone forever.

"I think I will say good-by now," Brian said, speaking in a voice rather unlike his own. "I must catch the mail to-night. He came over and stood beside the table. "Good-by, Dolores."

She lifted her head, and for one instant their eyes met; then his grew hard and stern again.

"I don't suppose we shall ever meet again," he said, adding, bitterly, "What might have been can never be now."

So he went away, and Dolores, the possessor of thirty thousand pounds, wept the bitterest tears she had ever shed in her life, and the letter that reached Guy telling of uncle Hal's legacy was so blurred and blotted with tears that he could hardly read it.

"I fancy Mr. Mannering was disappointed," said William to Dolores that same evening. "I have never seen a man with such an almost broken-hearted look on his face; and yet what right had he to expect anything?" And then he stopped, amazed at the look that came into Dolores' eyes.

"William," she cried, passionately, "you do not know what you are talking about. Let me tell you that had it not been for Brian Mannering our uncle would never have left me one penny; and he could have had the whole thirty thousand pounds himself if he had liked, for uncle Hal meant it all for him." She vouchsafed no further explanation, but from her manner William had no doubt of her words.

Guy got a week's leave when he received Dolores' letter, and hurried by the first train to Kilblany.

"Why, Dolores, you don't look half pleased!" he exclaimed, when he caught sight of her face. "I thought you would have been so glad. You are an heiress now—a live heiress!"

"So I am glad, Guy," replied Dolores, coloring a little—"and most glad of all for your sake, dear; you won't have to be so economical now, Guy."

"You dear, little thing!" he said, stooping and kissing her. "But I am not going to live on you, Dolores; I was a brute ever to do so."

"But you won't refuse to let me help you, Guy—for what will be the use of all that money to me?"—smiling a little sadly as she spoke.

* * * * * * *

"Can nothing persuade you to come, Mr. Mannering?"

"You are very kind, but you know I am no lover of balls and parties; I came down to Harry Grant's only for the shooting."

"And didn't expect to be so victimized!" laughed Mrs. Haycroft, a sprightly matron with four marriageable daughters. "But I am determined to force you out of your shell by fair means or foul. Mr. Grant tells me you are a regular hermit."

"And mean to remain so," decided Brian, inwardly, as he thought of the four gushing Misses Haycroft; but he only smiled a little wearily, and looked out at the trim croquet-ground, with its ribbon-border blazing in the sunshine and the two youngest Misses Haycroft, attired in the latest extravagant fashion, playing Badminton.

"Would you like to play?" asked Mrs. Haycroft, following the direction of his glance. Brian answered, quickly—

"Thanks, no; I think it is rather hot—don't you?"

"Well, perhaps so—but the girls don't seem to mind."

And then Mrs. Haycroft's mind went back to her dance again. It was hard work beating up recruits—gentlemen were hard to be procured. There was not even any barracks near to import officers from; and Brian Mannering was good-looking and eligible—so, after further consideration, she returned to the siege with renewed energy.

"But won't you really come to my party? You might not find it so bad as you expect."

"I am sure it would be very pleasant," Brian answered—"but really I haven't been to a dance for five years or more."

"All the more reason to turn over a new leaf. We have an heiress too. She is from Ireland—and such a nice girl."

"She must be different from most heiresses, then," said Brian, smiling.

"Oh, yes, she is so pretty—the loveliest face I have ever seen, and the possessor of thirty thous——"

"What is her name?" asked Brian suddenly turning away his face.

"Chetwood—Dolores Chetwood. She is only two-and-twenty. Her fortune was left her in a most romantic manner. An old uncle died, who was always supposed to be poor, and left this delightful sum to Miss Chetwood, who had always been kind to him. Was it not strange?"

"Very," replied Brian, thinking how much more romantic the real story of Mr. Chetwood's will was.

"And she is pretty?" he asked, carelessly.

"Oh, more than pretty! Her eyes are beautiful."

Brian got up and walked to the window. Only too well did he remember the beauty of those deep violet eyes with their dusky lashes. For a full minute he did not speak. Then he said—

"I wonder the heiress isn't married, with her youth and beauty and wealth. It is odd some lucky fellow hasn't carried off the prize."

So calmly he spoke that Mrs. Haycroft never guessed the interest he took in her answer, or how his heart was beating. She was quite ready to tell him all she knew about the heiress, especially as all the time he was watching the Badminton going on in the garden.

"Every one is wondering," she began, "that Dolores Chetwood does not marry. I myself fancy she is very hard to please. She has admirers in plenty, but treats them all equally coolly, and only last week refused the great catch of the county—Sir Frederick Tempest. He was in an awful state, and went off to Paris in despair. Mr. Haycroft said he never saw a man so cut up about anything; but he acknowledged that Miss Chetwood never gave him the slightest encouragement."

"Then he had only himself to blame," remarked Brian, shortly, and he abruptly changed the subject; but as he took his leave, he promised to come to the party, and so artfully did he announce his decision that Mrs. Haycroft never suspected his real reason for changing his mind so suddenly.

* * * * * * *

It was three years since Brian Mannering had seen Dolores—three long years—and now he was unexpectedly to meet her again. It was very late when he arrived at Mrs. Haycroft's on the night of the ball, and he stood with a knot of men in the doorway, watching the dancing, but seeing only one face, that of Dolores Chetwood, who seemed the center of attraction and admiration.

She was charmingly dressed in pure white, soft and shimmering, with pearls on her neck and arms. To him she appeared changed. With all her wealth and beauty, she did not seem happy; there was a weary, dissatisfied look in her eyes; and when she was not smiling her mouth was pensive, almost sad. Yet none but the keen gray eyes watching her every movement so intently saw aught but a young lovely face, whose eyes had a touch of seriousness perhaps—nothing more.

Brian made his way through the room at last, and went straight to Dolores. A sudden flush and tremor of excitement came over her face as the sight of him brought back the recollection of the old time so keenly; and then, as she laid her hand for a moment in his, she turned white to the lips.

"I have startled you," he said, in his old well-remembered voice. "Can you give me one dance?"—taking her programme out of her hand. "There is one left—may I have that?"—scribbling his name on the scrap of gilded pasteboard, and never noting that her lips were quivering so that she could not answer.

Brian waited patiently for a whole hour or more, when his turn came at last, and he and Dolores took one turn round the room; and then he said, looking down at her with pitiless eyes and firm mouth—

"I came to see how you bore your honors. Have they brought you much happiness?"

"As much as I expected they would," answered Dolores. "Please stop—I am tired."

"It is nice and cool on the terrace—will you come?"

Side by side they stood in the soft dusky night, Brian was the first to speak.

"You don't look happy, Dolores."

"Don't I?"—with a little nervous laugh. He laid his hand on the small one that trembled so sadly on his arm.

"And yet you have everything to make you happy."

Dolores, looking up wistfully at him in the gloom, returned, with a little catch in her voice, "Why do you talk of these things?"

He looked down at her and said, almost sternly, trying to shake the calmness of the white upturned face—

"I am going to try life in the New World. I don't suppose I shall ever see you again. May I ask you one question, Dolores?"

"Yes," was the brief reply; and Dolores, slipping her hand from his arm, leaned against the marble balustrade and waited for him to speak.

"Why did you not marry Sir Frederick Tempest? I mean, what was your true, real reason?"

"I did not care for him," replied Dolores, simply.

Brian laughed a laugh not pleasant to hear.

"Why not? Who thinks of caring when money and title are concerned?"

"You have changed your opinion then," said Dolores, her voice betraying more than her words.

"I have not," was the firm rejoinder. "I was only quoting the world's opinion. But why could you not care for Sir Frederick?" Though he could not see her face, Dolores put up one hand quickly to shield it from him. "Do you care for any one else?" he asked, in the same hard voice he had used all through; and Dolores answered, with a burst of weeping—

"Yes;" and then, low and passionately she added, "Oh, why will you make us both miserable?"

He grasped her wrist tighly, speaking hard cruel words.

"And you tell me this—me of all men, whom you have made the most miserable on earth! Well, good-bye! You know now what it is to feel as I have felt for three long years. I am going now. Good-bye forever!"

With a cry Dolores held out her hands.

"Brian, Brian, why will you be so blind?" He turned and caught her hands in his.

"Dolores, do you mean this?" he asked, feeling as if his whole life hung upon her answer. "You said you cared for somebody else."

"I have never cared for any one but you!" she sobbed. "And, oh, Brian, I couldn't let you go away when you were too proud to speak!" And, as Brian held her tightly to his heart, he whispered—

"Nothing but death shall come between us now, darling!"

People said that Brian Mannering was a lucky man, but no one but himself and Dolores ever knew upon what a mere chance their life's happiness had hung. In after life they used to laugh and say they owed a good deal to Mrs. Haycroft's ball.

BRIC-A-BRAC.

By flowers, understand faith; by fruit, good works. As the flower or blossom is before the fruit, so is faith before good works; so neither is the fruit without the flower, nor good works without food.—*Quarles.*

The new French life-saving mattress is highly commended. It is formed of two rows of blocks made of cork cuttings, lightly compressed by machinery within a waterproof case, and the whole covered with canvass. It forms, ordinarily, a mattress, which is intended to be placed in every cot or berth, and makes a bed which is said to be very elastic and easy to lie upon. Its weight is about six pounds, and it is constructed in such a manner that it can be quickly put about the person, forming then a double belt, and attached in such a way that it cannot possibly be displaced by the winds or waves.

Shamoy skins are, as every one knows, largely used for many purposes—for inside linings of gloves, etc., and for cleaning purposes in many departments. It is not derived from the skin of the chamois, as is sometimes ignorantly supposed from the sound of the name, which results from the process, but from the flesh side of the sheepskins which have been split. The skins, after having been passed in the ordinary way through the earlier processes of washing, etc., are soaked, first in lime-water and next in a mixture of bran and water, or in a weak solution of sulphuric acid, after which they are beaten in a mill till no moisture remains in them. Fish-oil is then poured over the skins, which are again beaten till they are thoroughly impregnated with it. This is done over and over again until the skins can receive no more oil, and then they are hung for a short time in a room heated up to a certain temperature. They are then carefully washed in a solution of potash, which removes any oil that may still remain about the leather; and thus we have the shamoy skin of daily use.—*Good Words*

TO MRS. B.

Black thy dress is as the glancing
Shadows on our parting night;
Black thine eyes are as the dancing
Lakelet in the full moon's light;
Black thy locks are as the shifting
Branches of the chestnut tree,
Through whose leaves, the moonbeams sifting,
Quivered o'er thee, Mrs. B.

Witching is the maiden's shy glance
To the youth of softer heart;
But the magic arming thy glance
Surely is the true black art.
Luckless he who feels its slightest
Touch; he has no power to flee.
Blackest clouds flash lightnings brightest;
Thine have pierced me, Mrs. B.

Masked thy batteries are by lonely
Bombazine and dusky crape;
When we find they 're hidden only,—
Ah, 't is too late to escape.
Crafts that sail 'neath colors sable
Give no quarter to their prey;
Mrs. B., how wast thou able
So to pluck my heart away?

[*A. S. T.*

During the winter evenings, when the children were engaged with their lessons, our tame rat, Billy, was usually to be found on the table rummaging among their books and catching at their pens; which latter amusement he enjoyed very much after the manner of a kitten running after a knitting-needle drawn quickly up and down the table, but as these amusements rather interfered with the studies, Billy would occasionally be dismissed to the kitchen, to which he had a great dislike. He never stayed there longer than he could help, but on the first chance would rush up stairs and scratch, or rather, I should say, gnaw for admittance. Speaking of this gnawing leads me to observe that one objection I had to receiving him was the fear that he would be very mischievous; but fortunately I never found him so. He had free access to a pantry where a variety of eatables, usually considered dear to a rat's heart, were to be found, but I never knew him to injure anything, or even to cut the paper covering of any parcel, no matter what it contained. No doubt it was partly owing to his being so well fed that he was not driven to theft by hunger. I generally scattered for him on the shelves some grains of rice or pieces of starch, and to those he helped himself when inclined. From soap or candles he turned away in disgust, being far too well-bred a rat to indulge in such low tastes; but he dearly loved a bit of plum-cake; and, shall I confess it, he was by no means a teetotaler. If ale was used at dinner, he would rush eagerly about the glasses until he was supplied with some in a spoon. I believe, before he came to us, he had been accustomed to even stronger potations, in which, however, we did not indulge him. I have said he was not mischievous, neither was he, as mischief among rats is generally understood; but there is no rule without exception, and Billy had a decided penchant for kid gloves. If any were left carelessly about he was sure to get hold of them and have the fingers eaten off in a few minutes. I cannot tell how many gloves he destroyed, until repeated lessons of this sort enforced more steady habits. I must not omit to mention his love of music; when he heard the piano he would rush to the drawing-room and spring to the performer's knees, where he would remain perfectly quiet, evidently listening with much pleasure. When he first came he was very restless, seeming to live in a state of perpetual motion; but he soon learned to come upon the knee to be caressed and have his head rubbed, which operation afforded him intense enjoyment. He would have lain in supreme delight for an hour if anyone would have rubbed his head for so long.—*Chamber's Journal.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

ROCK OF AGES.

F. L. STANTON.

"Rock of Ages cleft for me,
Let me hide myself in thee!"

Sang the lady, soft and low,
And her voice's gentle flow
Rose upon the evening air
With that sweet and solemn prayer
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

Yet she sang as oft she had
When her heart was gay and glad,
Sang because she felt alone,
Sang because her soul had grown
Weary with the tedious day;
Sang to while the hours away.
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

Where the fitful gaslight falls
On her father's massive walls.
On the chill and silent street
Where the lights and shadows meet,
There the lady's voice was heard.
As the breath of night was stirred
With her tones so sweet and clear,
Wafting up to God that prayer:
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

Wandering, homeless thro' the night,
Praying for the morning light,
Pale and haggard, wan and weak,
With sunken eye and hollow cheek
Went a woman, one whose life
Had been wrecked in sin and strife;
One, a lost and only child,
One by sin and shame defiled;
And her heart with sorrow wrung,
Heard the lady when she sung,
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

Pausing, low her head she bent,
And the music as it went
Pierced her blackened soul, and brought
Back to her (as lost in thought
Tremblingly she stood) the past,
And the burning tears fell fast,
As she called to mind the days
When she walked in virtue's ways;
When she sang that very song
With no sense of sin or wrong;
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

On the marble steps she knelt,
And her soul that moment felt
More than she could speak, as there
Quivering, moved her lips in prayer,
And the God she had forgot
Smiled upon her lonely lot;
Heard her as she murmured oft,
With an accent sweet and soft,
"Rock of Ages, cleft for me,
Let me hide myself in thee!"

Little knew the lady fair,
As she hung in silence there,
That her voice had pierced a soul
That had lived 'neath sin's control!
Little knew, when she had done,
That a lost and erring one
Heard her—as she breathed that strain—
And returned to God again!

A WOMAN'S HOME FOR WOMEN.

An enterprising young lady in New York has conceived the idea of providing a home for business women, where they will not only be provided with the comforts of a home, but where a woman's self-repect will not be insulted by stringent rules. The indignation created among women by the regulations adopted at Stewart's Hotel shows how keenly the indignity cast on them by the restrictions there enforced is felt, and women will doubtless promptly avail themselves of this opportunity to obtain, not only good accommodations at reduced rates, but what is little less important, courteous consideration. Miss Leggett has very wisely decided to treat her guests *as guests*, and not as pensioners, which latter is the case in most "homes."

We give the circular entire for the benefit of our rural girls or women, who may think of establishing themselves in New York. A word as to the projector of the enterprise. Miss Sarah H. Leggett is a lady who, to culture and refinement and a most pleasing address, unites excellent business ability, and who has really the good of women at heart. That this is *not* a money-making scheme, must be patent to all, for the low price charged for board, and the absence of "extras" preclude the possibility of there being "millions in it." We wish for the enterprise the success it deserves.

The spacious and elegant dwelling No. 61 Clinton Place, second door east from Fifth Avenue, has been rented by Miss Sarah H. Leggett, who proposes to open it as a Boarding-house for young Business Women.

Her desire to provide a home for this deserving class of society, where every attention shall be paid to the comfort of the inmates, and where they will enjoy every social advantage without being subjected to any other restraint than those which are necessary to every well-regulated household.

The entire building has been thoroughly painted and repaired, and will be ready for the reception of guests April 15th.

Meanwhile, applications for rooms and all inquiries may be addressed to the housekeeper, who will be on the premises after Saturday, April 6th.

The meals will be of the best quality, well cooked, and nicely served, and at hours to suit the convenience of all.

Sewing machines will also be provided for the use of the inmates.

Board, including use of the bath-rooms, parlors, library, piano, and every privilege of the house, will be $4 per week.

The library will be furnished with the best reading matter, and also with the leading periodicals and journals, which have been generously contributed by the publishers of New York.

If any lady desires to have a room alone, an extra but very moderate charge will be made.

In cases of sickness, meals will be served in the rooms, and attendance provided, without extra charge.

As the object of the founder is to establish a really home-like home for herself and guests, no element will be introduced which will not be in sympathy with trades-working and business women.

If further particulars are desired, Miss Leggett will be happy to see her friends, and answer all inquiries, either at her book and stationary store, No, 1184 Broadway, between 28th and 29th Streets, where she is occupied during the day, or at her residence, No. 61 Clinton Place, during the evening.

References will, of course, be required.

References given: Mr. Peter Cooper and Mr. William Cullen Bryant.

MEN'S PART IN HOME-MAKING.

Most of the preachments we have seen from the text of happy homes have been aimed at the women. This is natural enough, for they are the home-makers of the world; but just now we desire to nudge the heads of the households, and ask them how they are performing their responsible part in the realm of home. Their forte lies in breathing and enjoying the atmosphere after somebody else has made it—and not a few can't get along and make known their authority without "raising a breeze" in it. Men are too busy, too much pre-occupied, too impatient and thoughtless, and—it must be said of some of them—too selfish to do their fair share of that pre-eminently millennial work, the creating of a happy home, wherein love reigns supreme, and amiability, affection, cheerfulness, joy and peace are the natural conditions of family life.

Now in certain things man has been a constitutional *shirk* from the time of Adam—if the scientific gentlemen have left us any Adam—down to this day. Men will fight for their homes, and make slaves of themselves to their business to maintain them; but like the proverbial man who would die for a woman, but would never bring up a scuttle of coal, they can't tell what their children are studying at school, who their mates are, what they are learning of good or evil, nor hardly anything else that a father ought to know concerning his offspring. It is so sad a fact as to spoil the satire, when it is said that many a father finds his Sundays and holidays too few to enable him to "become acquainted with his boys." But we maintain that a man who *hasn't time to be a father to his children, with all that includes, has no right to have any.* He wrongs them, robs himself, puts an unjust responsibility upon the mother, and neglects his highest duties, human and divine.

There are so many ways in which a father may contribute to happy home-life that it seems strange the number of *houses* should greatly exceed the *homes.* It takes so little to make children happy at home, that it is a wondrous pity so many little ones are miserable, or uneasy, or discontented. If for an hour after the evening meal the father should give himself to his children, would the mother wear out so fast, or the children be so lawless, troublesome and uncomfortable? What a ministry for good to both parties is a papa's frolic with the babies! What an interest is added to the books, the drawings, the games, or even the studies if the father enters into them!

Aside from the children, and in homes where haply there are none, men still have a more direct part than most of them are ready to bear, in making the daily life pleasant. We hardly need say that a man should set the example for the family in patience, cheerfulness, courtesy, forbearance, and all the amiable moods and graces that are the soul of home happiness. The sort of men who display all their suavity and politeness on the street or at their business places, and save the storms, and sulks, and sourness, and all the evil brood of devilish dispositions that they characterize by the convenient euphemism of "moods"—well, we have our opinion of them! and if they will come within range, we don't mind expressing it privately; but we are afraid it wouldn't look well in print!

The whole tribe of home tyrants—men who make the entire household revolve around them as the center; whose tongues are chronically "furred" in the morning, and nerves so upset in the evening that the family must keep silence while they read and smoke; who "can't bear" the noise of innocent and natural mirthfulness; who have to be toadied and tended and humored; they ought all of them to be doomed to pass their days in a shabby-genteel boarding house, without sight of wife or children—with hash for breakfast, warmed-over pancakes for lunch, and lean mackerel and centennial hens for supper, with the lodger overhead always learning the trombone and servant girls that steal the hair-oil. They don't deserve a home, and no man does who will do nothing to make it. For man's rights do not include the right to all the comforts of a home without any of the work, or worry, or self-sacrifice, or thoughtfulness and well-doing incident to its creation and maintenance.

A good many men think they have done their full duty if they pay the bills, more or less grudgingly. But one might as well try to warm a room with a fire-place and a pair of silver-plated andirons, and no fuel or fire, as to make a home with money. The money simply makes a place for the home; to complete it the man must put in himself, and the best part of himself at that.—*Golden Rule.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

APRIL is in one of her sullen moods to-day, for the sky is dark and lowering; a mingled snow and rain drips from the leaden clouds and the birds hide shivering in the evergreens, while we stir up the kitchen fire to a brighter blaze. The boys have made bird homes of hollow logs, and carried out sheaves of grass seed and grain to feed the feathered friends that have returned too early to their last summer haunts. It is a good deed for the birds, and teaches our children to be kind-hearted, and to act as protectors, instead of destroying the pretty songsters. So tame were they during the last storm that they came into workshop and barn, and flew about unmolested. Very fine has been the weather lately and we have been thinking seriously of house-cleaning. Yet experience proves to me that it is often wrong to trust to the first fine days of a season, which are often followed by a cold rain. The rooms cleaned will gather dust, fires are necessary, and the work has often to be done over again. I find it a better plan to spend the time attending to the spring outfit of clothing, packing away unnecessary garments with camphor in paper bags that are impervious to moths, and looking over and lengthening the children's clothes, often found too small after their winter's vigorous growth. Then, when in early May the settled warmth is an assured fact, an extra hand to help and plenty of soft water, soap, and ammonia will take off easily the smoke and dust stains that will accumulate, and the fresh sweet air can penetrate to the heart of every room. I do not find this generally unpleasant task half so grim and odious as it is portrayed. A little system—the fact of beginning and finishing one part at a time—creates very little family disturbance and quite involuntarily, as the double windows are taken off and the cool green blinds take their place, I find myself singing a stanza of Whittier's beautiful poem:

"The west winds blow, and singing low
I hear the glad streams run;
The windows of my soul I throw
Wide open to the sun."

One summer the ants found their way to a certain cupboard where sweets were kept and, for the benefit of the lady who inquired in the RURAL for a remedy as well as of others so troubled, I will give my plan of proceeding. When house-cleaning the next season I removed everything and washed the shelves and sides of the cupboard with clean water; then went over the ground again with a water in which red peppers had been boiled to which was added a little ammonia and carbolic acid. The doors were left open awhile before we put anything in, and as a precaution, I placed frequently a fresh bone on the shelves to attract them and kept out such things as sugar for that season. But the ants never returned. If they had they would have gathered on the bone and could easily have been destroyed by scalding. Carbolic acid is very useful but needs to be in experienced hands on account of its burning nature. It is a good disinfectant and can be used in many ways during the period of house-cleaning. I hope all the ladies who read the RURAL keep a scrap book in which the good things floating in newspapers may be kept. I would say for their information that any starch left over from the washing is just as useful as a paste made on purpose and saves time when a few choice pieces are on hand and in danger of being mislaid.

SHIRT IRONING.

IN looking over some back numbers of the RURAL, I noticed an article on shirt ironing by "One Who Tries to Learn," asking for suggestions, or the experience of others. Thinking my method superior and less laborious, I most willingly give it. Dissolve two large tablespoonfuls of starch in one quart of cold water; let stand and settle; turn that water off carefully, which removes the gummy substance which is the principal cause of the iron sticking. Then add a very little fresh water, sufficient to make it thin enough to pour into boiling water, letting it boil up nicely, and to one pint of starch add a teaspoonful of kerosene oil. Starch your goods, letting them dry before ironing; then sprinkle the same as other clothes. If wished very stiff, dip them again into the starch. When ready to iron, rub a little beeswax on the iron and wipe thoroughly on a piece of clean paper. Smooth shirt-bosoms evenly, rubbing them with a clean dry cloth before ironing, or a damp one if too dry. I have no trouble with the iron sticking to the goods since I have learned to dissolve the starch in cold water and pour it off before using. The same holds good for cold starch which I use as often, adding a pinch of salt instead of the kerosene oil. I trust those who try this will be as much benefited as myself.

Yates Co., N. Y. MRS. MARY OLIN.

ANT EXTERMINATOR.

PLEASE accept a perfect ant exterminator of either the large or small black or the red. Spread plentifully upon the shelves in closets visited by ants *common salt*, also filling all crevices in wall or wood-work. As the salt will adhere to anything placed upon it, I spread newspapers over it. After a short time the salt becomes damp; you may then put on fresh paper but do not remove the salt during warm weather. Jellies, custards, cake, sugar in fact nothing will tempt them to forage where salt is plentifully sprinkled. The above I know from experience. MRS. M. G. B.

Sandusky.

QUERIES ANSWERED.

PLEASE furnish me with a No. 1 recipe for Mock Turtle Soup? May I also hope for directions for preserving natural flowers so that they will retain their color and form? I would like to commence with roses, lilies and some of our lovely wild flowers. MRS. M. G. B.

ANS.—No. 1. The following recipe for Mock Turtle Soup I think you will find very good. Clean and wash one large calf's head and two pig's feet; put to boil in four quarts of water—the kettle must be covered tightly throughout—until the meat will slip from the bones of the head. Select enough of the fatty parts from the cheeks and top of the head to fill a teacup and with the brains set aside. The meat from the head should be reserved with the brains until the next day. Chop the tongue very fine and with the selected fat add to the stock. Season with pepper, salt, majoram, thyme, cloves, mace, allspice and nutmeg. *Simmer* for two hours longer, removing the bones of the feet when the flesh falls from them. Then take from the fire, pour into an earthen dish and set aside until the next day. One-half hour before dinner remove as much of the grease as desirable, boil, strain and add the reserved meat cut into little squares. Thicken with a tablespoonful of browned flour rubbed smooth in a little water. Five minutes before removing from the fire add the force-meat balls made as follows: Rub to a paste in a bowl the yolks of four hard-boiled eggs gradually adding the brains, a tablespoonful of melted butter and a little salt. Mix with this two well-beaten eggs and with floured hand form into little balls the size of a small marble. As the soup is dished add a large claret-glass of sherry wine and the juice of one lemon. Three pints of this soup are amply sufficient for *ten* persons, or even more.

No. 2.—Many flowers may be preserved for months by dipping carefully when gathered in limped gum water; when drained they can be arranged in a vase when their shape and color will be preserved long after they are dry. Another method to preserve natural flowers is to dip them into melted paraffine, quickly withdrawing them. The paraffine should only be hot enough to maintain its fluidity. Hold the flower by its peduncle and move about an instant to get rid of air bubbles. The flowers should be fresh-cut and free from moisture.

News of the Week.

NEWS OF THE WEEK.

THE sensation of the day is the confession of Mrs. Tilton that the charge made by her husband with regard to her and Henry Ward Beecher, is true. Beecher has explicitly denied that she was guilty, as she now alleges. The unfortunate woman has so often made charges and afterwards retracted them and contradicted herself, twice under oath, that this confession is robbed of the force it would have had, if the woman's conduct and words had not been so unsatisfactory. Probably no further legal steps will be taken in the matter. Those who have believed Beecher innocent, will, as a rule, continue to regard him as the victim of a foul conspiracy, whereas those who have thought him guilty will be confirmed in that conviction. Beecher and Tilton are both now on lecture tours, the former in rural New York, the latter out West. Rumors are contradictory about Mr. and Mrs. Tilton living together again; and it would be hazardous to venture an opinion on the future conduct of such erratic people. 'Tis unfortunate that this hideous scandal should be reopened to the detriment of public morality.

Blair's bill to test the Presidential title was introduced in the lower House of Congress on the 15th, and referred to the Judiciary Committee where it will probably remain without any action being taken on it. A shipboard of colored emigrants has left Charleston, South Carolina, for Liberia, Africa, and the movement is rapidly spreading throughout the State. It is partly a religious movement, fostered by hopes of great worldly advantage in the growing colony. Should it prove successful it will certainly injure those sections of the South from which it will draw the laborers who now do all or nearly all the field-work. More Indian outrages are reported from Western Texas, where the adherents of Lerdo are reported to be actively exciting trouble on the frontier, with a view of disturbing the friendly relations at present existing between Mexico and this country. A political sensation was caused about the middle of the week by the publication in a New York paper, of an alleged interview with Senator Conkling. The brilliant New York statesman handled the President, Cabinet, their conduct and policy without gloves; but although the thing was spicy reading, it turns out to be only one-half true, as Conkling denies a great deal of it although he does not specify which parts are false. An amendment to the House bill with regard to Gen. Shields has been made in the Senate adding the names of Gen. Grant and other meritorious officers no longer in the public service to the name of Shields, to be placed on the retired list of the army with pensions. The whole thing was a mere political dodge to escape the odium of preferring Field to Shields as doorkeeper. There has been a great deal of shooting all over the country this week—principal cause, intermeddling criminally with other men's belongings in the shape of wives, daughters and sisters. At Coal Creek, Ind., there has been a bloody miners' riot between white and colored workmen—three killed, a number of others more or less severely wounded.

Large shipments of horses are being made on most of the steamers leaving this port for England, ostensibly for tramway purposes mainly, but many believe in part at least for cavalry use. Fernando Wood insists that his tariff bill looking towards freer trade, will have a majority of 23. Senator Blaine has made a vigorous speech against the measure before a friendly audience at Chester, Pa. All over the country there is much talk about immediate resumption of gold payments. Some banks, in most of the States, are already redeeming their own notes in gold, and several factories have paid their hands in the same coin. The movement is far more general West than East, for money-changers are loath to give up their pickings and percentages, and the East is their stronghold. A vigorous effort is being made in Congress to reimpose the income tax: income is certainly better able to pay than poverty. There is a fresh rumor that ex-Governer Fenton will be nominated instead of Gen. Arthur as Collector of this port. Another fight between Conkling and the administration with the odds this time in favor of the latter. Just now (April 21 and 22) a fearful snow-storm and flood are making things uncomfortable in the Black Hills, and moreover hostile Indians have put in an appearance.

Over the water political affairs are still intricately confused. There is yet a vast amount of talk about the possibility of preserving peace and a good deal of vigorous action looking to the probability of war. The fact is that the season has hardly yet arrived for commencing military movements, and both England and Russia are straining every nerve to get their forces and supplies in an efficient condition, to bespeak the favor of public opinion and to isolate each other, while each of them is doing its utmost to secure the friendly neutrality or gain the actual support of other nations. The Czar has succeeded in raising among his own subjects a considerable loan, fresh enlistments are swelling his armies, depleted regiments are sent home, ostensibly with a view to rest, but really to recruit their thinned ranks from the new levies; princes, nobles and people are raising funds to fit out a swarm of privateers to prey on the rich fleets of British merchantmen that whiten the ocean with their sails or darken the air with their smoke in every part of the navigable globe; and all the while the Muscovite resolution is growing stronger to keep a tenacious hold on the advantages secured at the cost of Muscovite treasure and Muscovite blood. In England public opinion seems to have petrified into a firm determination to protect, even at the risk of a bloody war, the vast interests which elevate to the rank of a first-rate Power the narrow area of the British Isle, and which the nation sees seriously menaced by the results of the late conflict. The people remember that in all late continental wars in which their country has been involved, although she may have been isolated for a time, her mighty financial resources and the broad grounds of European safety and welfare on which her action has been, as a rule, based, have ultimately won to her side powerful allies by whose assistance she has always finally triumphed.

Meanwhile, at the same time that she is industriously increasing her forces at home and fitting out a fleet which can sweep the seas, not only of the Russian flag, but even of the combined fleets of the world, she is summoning to her aid the dusky legions of British India as well as her ardent children from the distant colonies of Canada and Australia. With the exception of a few Radical soreheads, all her people are united, and the royal family are as enthusiastic in their support of all measures tending to maintain British honor and British interests as the most thoughtless shopman who draws his inspirations from the political doggrels of the streets and the music-halls. Bismarck has still hopes of a peaceable issue to the present complications, and while trying to clear the way for the meeting of the long-deferred Congress, is urging the simultaneous withdrawal of the English fleet from the Sea of Marmora and of the Russian army from the neighborhood of Constantinople. Such a measure would prevent the mutual exasperation arising from the proximity of discordant elements, and the possibility of this exasperation finding vent in some hostile action that might inevitably hasten the dreaded crisis. Each party at first agreed to this measure in order to throw the blame of an outbreak on the other, but when it came to actually carrying the thing into action, each has discovered numerous difficulties in the way of its performance, for each is afraid that thereby its rival might secure some advantage. Roumania and Russia are still at loggerheads. The former has concentrated her forces along the Carpathian mountain range so that the Russians cannot cut them off from Austria; the Muscovites have occupied nearly the whole of Bessarabia and the chief strategical points throughout the whole country. Gen. Todelben has succeeded the Grand Duke Nicholas in command of the Muscovite forces at San Stephano, and the latter is about to return to St. Petersburg. A strong anti-Russian feeling is springing up in Servia, and that State will remain neutral, if possible, in any future conflict. Austria is still on the fence; Russia is making large concessions to her; England is promising larger. As usual, Austria is sure to decide solely according to her own interests.

Grand preparations are being made in Paris for the opening of the French Exhibition on the first of May. The American department is in an advanced state of construction; a majority of the exhibits are already placed, and despite the tardy action of Congress, our countrymen have so vigorously exerted themselves, that our display will well represent the advanced position of the country in industry and the arts as well as its inexhaustible resources. Upwards of 100,000 operatives in the cotton and woolen mills of England are on a strike against a reduction of 10 per cent. on their scanty wages. Both employers and hands seem equally determined and a long period of dire distress is not improbable. In Russia there has been an *emute* of medical students and socialists; 3000 students took part in it in Moscow: 12 were killed; a large number wounded and still more taken prisoners who will doubtless swell the ranks of Siberian exiles. It was a movement of Nihilists, a sect or rather political organization, which has its secret members in every rank of Russain society, and whose tenants are confined to a belief that the whole order of society, as at present constituted, should be overthrown; that there is no hereafter; no spiritual existence "no nothing" except the present world, and that this is sadly in need of being set right.

VARIOUS.

Gortchakoff is in his 82d year—beating Lord Palmerston, who died in harness at 80.

Twenty-six gardeners are employed in the Vatican gardens. The number during the temporal power was forty-five.

The shipment of 600,000 pounds of buffalo hides from Fort Worth, Texas, this spring, indicates the extent of the winter's slaughter on the plains.

Castle Gandolfo, near Albano, has been prepared for the reception of the Pope, but, unless the weather grows unusually hot, he has decided to pass the summer at his post, in the Vatican.

An organ of the tobacco trade asserts that if the tobacco consumed annually, about 4,000,000,000 pounds, could be made into a roll two inches in diameter, it would encircle the world sixty times.

In the province of Nassau, Prussia, the common nettle has been treated like hemp, and is found to yield fibre quite as durable and as fine as silk. Factories have consequently been started for its manufacture.

President Wm. Orton of the Western Union Telegraph died in New York City on Monday, April 22d, at 11 A. M. Cause, apoplexy. Mr. Orton was the most widely known and influential man in this country in the business to which he has devoted most signal abilities.

The Berlin Housewife's Union seems to have been a great success. It supports a newspaper for the discussion of all housekeeping questions, a co-operative store, which supplies 4,000 families and an agency for servants, which in the past four years has supplied 16,000 persons with places

A free negro woman was kidnapped in Cincinnati twenty-five years ago by a slave dealer, and sold into slavery in Kentucky, where she remained until the close of the war. Recently she sued Sheriff Ward of Little Rock, the kidnapper, for $15,000. A long and closely-contested trial resulted in a verdict for $5,000.

The British "commerce destroyer," Shah, which so sadly battered the Peruvian ironclad last year, has gone home to be recoppered. She is said to be more than a match in speed and armament for any two Russian cruisers in the Pacific. In case of a war it is thought that she will make short work of the Russo-American "privateers," should any such be launched.

During the thirty-six years of its existence the income tax has brought into the coffers of Great Britain and Ireland the sum of £265,000,000, or $1,325,000,000 in gold. The highest rate—1s. 4d. on the pound—was in 1856-7, the years following the Crimean war. The lowest in 1875, was 2d., while the present tax, including the increase from the "six million" vote, is only 5d. (about 2 per cent.) on incomes above £160.

The late Lord Leitrim who was lately murdered in Ireland, did not go in for popularity. A few years ago he advertised for some one to fill up the vacancy in his Donegal agency. Three hundred applicants wrote to him, and in answer to one of them he said that he wished to appoint a military gentleman used to shooting natives in Australia and New Zeland, as he wanted a wholesome lesson given to the tenants on his estate.

The bottom facts of the far-famed "Malta Scandal" in which the Duke of Edinburgh, husband of the Czar's daughter, was implicated, appear to be as follows: A Lietenant Scott-Stevenson, belonging to the garrison, had an extremely pretty wife to whom the Hon. H. Monson, one of the Duke of Edinburgh's equerries, paid assiduous court. The matter coming to the ears of the husband, he promptly challenged the equerry who as promptly declined. The affair was noised about the island, and the Duke, to save his friend's reputation challenged Lieut. Stevenson himself. The Lieutenant declined on the ground that he had no quarrel with the son of his sovreign, and the matter was ultimately compromised by Mr. Monson consenting to leave the island. It subsequently appeared that Mrs. Stevenson had indiscreetely communicated the facts of the case to a lady friend. Mr. Monson returned. On the quay he was met by the irate husband, who publicly caned him in the presence of a dozen brother officers. It was only after a court of inquiry had been summoned, and the conduct of all parties pronounced "honorable," that the affair was suffered to drop.

CORINTH, Maine, Feb. 12, 1878.

TO THE DAVIS SEWING MACHINE CO., Watertown, N. Y.—*Gents:* We are manufacturers of clothing; have been engaged in the business for the past fifteen years, manufacturing largely for Miner, Beal & Hackett, Isaac Fenno & Co., A. Sherman & Co., Smith, Richardson & Bates, Prager, Bock & Co. and Leland, Rice & Co., all of Boston. We have used the Davis Vertical Feed Sewing Machine for the past four years in manufacturing our clothing, and we know that it is better adapted to our business, and possessed superior advantages over any of the under-feed sewing machines.

Within the last three months we have had occasion to seam our clothing with double thread, and we find that the Davis Vertical Feed Sewing Machine (and no other family sewing machine) will do the work as well and easily as with the single thread. Yours, truly, T. BRACKETT & SON.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 20, 1878.

BEANS AND PEAS.—Mediums beans have merely their seasonable activity and that does not require much wholesale movement. The few buyers seem to want only best grades and they prefer paying the extreme to risking under quality. Marrows are very quiet and likely to be until the Havana market allows a margin for shippers. Late rates are nominal. Pea beans a shade better. Kidneys are not above plenty and both red and white are fairly steady at quotations. Black beans strong at a further advance. Canadian peas go out fast enough to hold up prices: bulk and bond, 82@84c.; green peas quiet but a little stronger in price; $1.10@1.12½ Southern B. E. peas per two bush. bag, $2.80@3.

Receipts of beans, 2,200 bush.; exports, 116 bbls.; exports peas, 19,600 bush.

We quote:—Beans, medium choice, $1,60@1.68; other, $1.30@1.50; marrows, choice, $1.80@1.85; other, $1.55@1.70; pea, $1.35@1.65. White kidney, choice, $1.35@1.65; other, $1.85@1.95; red, choice, $2.05@2.40; Black, $2.50@2.75.

BEESWAX.—Is offered lower, being in fair supply quoted at 27@28c. for Western and Southern. Exports past week, 9,925 pounds. Receipts 204 packages.

BROOM CORN.—Has rather a freer demand.

Moving time in New York largely increases the demand for brooms; and the fact generally strengthens the market for corn.

Quoted at 6@7½c for hurl and short brush; 5@6½c.: for medium green, 4@5c. for red and red-tipped, ₩ lb.

BUTTER.—Old butter is passing out without interfering with new, though had the quality of last year's crop averaged fine, there is enough yet included in the receipts to have weakened white. As it is, a few extra saved state lines bring 22@26c for firkins good to prime, poor 10@12c; fair to good Welsh 19@23c., poor 11@14c., Summer made western 7@12c; sound winter 10@14c.; Grease 6@6½c. It is now late enough to caution shippers against packing two or more shades of new into one package. White hair better be allowed to take its chance, while pure grass will make its position. Arrivals of new are liberal notwithstanding the general opening of cheese factories. Creameries are largely included in the receipts and the deliverences of that style of butter promise to be heavy from both State and Western points. Receivers are putting it closer to fine half tubs than usual, though tender grade would prompt quick sale at this season. Still it is thought that the distribution of creamery will be quite extensive this year, and the range must be made to suit old purchasers of other prime stock. Prices for new this week are lower than they have been before this season, enlarged receipts and good quality of Western acting as a check upon State. All inside rates are for stock that has missed sale twenty-four or thirty-six hours.

OLD.—State dairies, choice 30c., other 26@29.; half tubs and pails choice 27@28c.; fair, to prime 24@26c.; poor 21@23c; Welsh tubs prime 26@27c; other 21@25c.; Western, creamery, best 30c., other, 26 29c.; good to choice dairy 22@25c.; fair 20@21c.; factory fresh 22@23c.; store packed or stenched 15@21c.

Receipts for the week 14766 pkgs.
Exports past week 1536 pkgs.

CHEESE.—Small lots of new are coming in and they are taken close at 12@13c. for full cream and 7@10c. for skimmed and half skimmed. Old is being closely sold up, and prices have not varied.

Fancy factories, 13@13½c.; prime, 12@12½c.; fair lots, 9@10c.; poor, 10@10½c.: 7@10c., skimmed. Farm dairy, 11½@12½c. for good to prime; Western factory, cheddar, 10@11½c. for fine; 12½c.: for good, 9@10c.: for poor, 6@8c.

Liverpool cable, 63s. Gold closes 100¼.
Exports for the week, 13,957 boxes.
Receipts, 12,983 do.

LITTLE FALLS.—New cheese is offering quite freely. The last market day was attended by prominent buyers. The cheese was mostly skim, some "every-other-day," and a few lots full milk. There was an indisposition among buyers to handle except on commission, and among factorymen to meet their views. Prices ranged from 7¼@11½c. The last price was for full milk, average price about 8¾c. Herds are in fine condition and will, it is thought, be turned to pasture in about two weeks, or sooner.

COTTON has ruled stronger most of the week with increased trade.

Latest prices are for April, 10,86c.; May, 10.93@10.94c.; June, 11.00@11.01c; July, 11.07c.; August, 11.10@11.11c.; September, 10.77@10.79c.; October, 10.56@10.58c.; November, 10.46@10.48c.; December, 10.47@10.49c.; January, 10.54@10.56c.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	7 13-16	7 13-16	7 15-16	7 15-16

Middling fair	11 13-16	11 13-16	11 15-16	11 15-16
Fair	12 5-16	12 5-16	12 7-16	12 7-17

Stained.

Good ordinary, 7 13-16c. Strict ordinary, 8 9-16c.; Low middling, 9 1-16c.; Middling, 9 11-16c.

DRIED FRUITS.—The general market has been stronger, and more active.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia 10@11c.; good to prime Georgia; 8@10c.; unpeeled halves, 4½c.; quarters, 4c. Pitted cherries, choice new 15@16c.; Raspberries, 26@27c. New York State plums, 14@15.; southern plums, 10@12c. Apples—State quarters, old, 4¾@5½c.; do sliced, prime, 6@7c.; Western quarters, 4@4¾c.; Southern, at 6@7c. prime sliced, 5@5½c. for fair to good.; Southern quarters at 4¼@4½c.; Tennessee quarters, in bags, at 2¾@3¼c.; prime fancy and North Carolina sliced at 8@:2c. Exports for the week 503 bbls. Apples chiefly old on private terms, but understood to be low.

EGGS.—Receipts for the week, 20,125 bbls. The demand for Easter wants during the past week has only stimulated prices a trifle. A good deal of stock has been worked of, including low grades. Many of the latter can be utilized at this celebration by being colored for show. Confectioners also use many simply by preparing the shell for fancy purposes. Good qualities may sell steadier than is usual after Easter, as prices are attractively low.

Near points, 12c.; State and Penn., 11@11¼c.; Western, fresh, 11c.; Southern, 10@10½c.; Inferior, 9½@10c.; Duck, 21@23.; Goose, 43@45. The call for the last two sorts subsides with the close of Lent.

FRESH FRUITS.—In apples Russets only have a commercial place. A few reds, $5@5.50: Russets, $4@4.50 prime, poor, $2.50@3. Cranberries quoted $2@3 as winding up rates. Strawberries have had a wide range many not paying the cost of freight which is 15c. per quart, poor to useful sold at 5@15c.; good to prime, 30@35c. the latter picked out. Hot-house Black Hamburg grapes, $3@2.50 per lb. Peanuts dull with heavy supplies, receipts 2,000 bags. Hand-picked Va.; prime, $1.35@1.40; good to choice $1.15@1.30; common, 85c..@1.00. Pecans, 6@8c.

FLOUR.—Fluctuates in prices as the advices on the other side are warlike or otherwise, closing with free sellers and diminished business.

Latest prices are $4.15@4.90 for poor to fancy superfine State; $5.00@5.30 for common to fair extra do; $5.00@525.; $5 20@5 60 for good to choice do.; $4.15@4 90 for superfine, Indiana, Iowa, Michigan, Ohio. (the latter an extreme); &c.; $4 90@5 20 for very poor to good shipping extra do do., (chiefly at $5.20@5.60) and $5 25@5 65 for good to choice extra do.; common to choice white extras, $5.60@6.00; fancy do. at $6.00@7.50; red and amber winter wheat, inferior to choice trade and family, at $5.85@6.50; round hoop Ohio at $5 00@5 35, and trade and family brands of do. $5.50@5.75, the latter for choice; St. Louis, $5.45@6.10 for poor to fair extra and $6.10@7.25 for good to fancy; (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, very inferior to very choice, $5.10@6.10; Minnesota "straight," common to fancy, at $5.75@7.00. few brands going above $6.50@6.60, and patent poor to very choice, $6.50@8.25, with a few fancy at $8.75@8.40; unsound stock at $2.25@5.75; city mill extra at $5 90@6.25 for fair to very choice for West Indies; do. for England $5.00@5.10; do. trade and family extras, $6.50@7.50; do. South America, $6.40@7.35 for fair to fancy; No. 2 at $2.85@4.15 for poor to strictly fancy (some very fancy lots quoted up to $1.05@4.10 but these are extreme figures).

CORN MEAL.—Is selling at $3.15 for Brandywine and $2.50 to $2.65 for Western yellow.

GRAIN.—Receipts of all articles are light and there has been considerable inquiry through the week, impelled by the English advices at advanced prices closing however easier.

Latest sales are of ungraded spring at $1.15@1.18; bush. No. 3 spring at $1.20, No. 2 northwest spring at $1.26; New York No. 2 spring at $1.24@1.25 Chicago spring at $1.25¼; No. 2 Milwaukee spring at 1.27; No. 1 Milwaukee and Minnesota spring at $1.31; ungraded white $1.43@1 46; white State, at $1.45@1.45; No 2 red, April, $1.36¼@1.36¾; New York No 2 spring, April delivery, at $1.25@1.25¾; do., May, $1.23¼@1.24, closing with $1.22¾ as the best offer; do., June, at $1.22¾@1.23; No 3 Milwaukee spring, first half May, at $1.21; No. 2 Milwaukee spring, first half May, at $1.26. Rye at 70@73¼c. for Western. Corn—Latest sales are of New York No 2 at 55c.; New York No. 3 at 52¾@53c.; New York No. 2 white, 55c.; steamer mixed, 53¾@54c.; steamer yellow, 54c.; low mixed, 51@54¼c.; white southern, 56c.; yellow southern, 58c. ungraded mixed, 50@53c.; round yellow, 56¼c. and Jersey yellow, 54@56c.; No. 2 April delivery, 55¼@56c.; No. 2, May delivery, 54c.; No. 2 June delivery, 54¼c.; steamer mixed, April delivery, 53@53½c.; do.. May delivery, 52¼c. Oats of New York No. 1 extra white, at 40c.; New York No. 2, 35c.; No. 2 white, 35½@35¾c.; New York No. 3 white, 34½c.; mixed State, 33@35¼c.; white State, 35¼@39¾c.; mixed Western, 34@36c.; white Western, 38@40c.

HAY AND STRAW.—Supplies are largely of medium goodness, which are at easy prices.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 35@45c. for short rye, and 30@45c. for oat.

Exports since Jan. 1st, 1522 bales; same time last year, 18,025 do.

HOPS.—Export demand has been very slack, and brewers have been buying sparingly with prices easy.

New Yorks, good to prime, 7@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

LEATHER.—Hemlock sole at 19@21c. for light, 19@21c. for middle and heavy, 17½@18¾c. for good damaged and 15@17c. for poor damaged.

MAPLE SUGAR.—Prices better with diminished supplies 10@12c. for sugar and 75c.@100 per gallon for strup including can.

OIL-CAKE.—Western quoted at $30@30.50 per ton.

PROVISIONS.—Hog products have been rather weak and fairly active.

Mess pork, $9.75@10.00 for spot lots; $9.75 for April, $9.80 for May, $9.85 for June and $9.95 for July. Bacon at 5¾c. for long clear and 5¾c. for short clear. Lard—Western steam, 7.27½c. for spot, April and May, 7.30@7.32½c. for June and 7.40 for July. Stearine, 7¼c. for prime. Tallow at 7¾c. for prime. Beef hams at $16.00@16.50 Beef—New Western. Beef hams at $16.00@16.50 Beef—New extra mess, $12.@12.25; plain, $10.50@11.50; new packet $14.00@15. family mess, $17@17.50; extra India mess $25@26.50 for city brands; do. Philadelphia, $24@$25.

POULTRY AND GAME.—Supplies have gone out readily, owing to the celebration of the Jewish Passover. Prime turkeys have sold quickly. Prices at the close are easy but as Lent is over some extra demand is looked for as city killers are not working against much country dressed.

Fowls, choice, 11@12c.; do. Western and Southern, 9@10c.; Roosters, 5@6c.; Turkeys, choice, 12@14c.; other, 10@11c.; Ducks, extra, 87c.@$1.12; other, 50@75c.; Geese, N. J., $1.25@1.75; Southern and Western, 75c.@$1.

There is no special call for dressed, and stock from Philadelphia and special N. J. poluts is all that arrive with any regularity.

Fresh-killed turkeys, choice, 14@15c.; poor to fair, 9@11c.; frozen, small, 16@17c.; capons, 32@33c.; slips, 28@30c.; Philadelphia fowls, dry-picked, 12@13c.; N. J., 11@14c.; State and Western range 8@12c.; Ducks, 12@18c., without much call.

Game is quiet, pigeons decidedly so, under a report of poisonous feeding at the Western nestings. Retailers are at times compelled to open birds to show the presence of beech nuts in the crops. Wild ducks will be outlawed after May 1st. Only a fer Canvasbacks find sale at $1.12@1.25. English snipe, $1.12@1.25. Plover, $1@1.12. Wild Pigeons, 75c. Squab, $1. Sand Snipe, 40@50c. Pigeons in feather pick badly; future shipments should be in ice. A good complement for a barrel, so as to allow sufficient ice, is twenty-eight dozen.

SEED.—Grass are firm, with small receipts. Clover at 7¼@7¾c. for Western; 7¼@7¾c. for State.

TOBACCO.—Export movement is more active, and the market is in better shape Quotations are for

LIVE STOCK MARKETS.

NEW YORK, April 20, 1878.

BEEVES.—Receipts for the week, 8,671 head; do., last week, 9,999 do. There was a fair total of good quality for Western steers, and the demand quite satisfied sellers, the advance being ¼ over the previous market. Ordinary to fair native, 8¾@9¾c. to dress 56 lbs.; good to prime 10@10¼c., dress 57 lbs.; extra 10¾@11c. dress 15 lbs., the highest rate paid by an exporter. Fat bulls 3.40¾@3.75 per head.

COWS AND CALVES.—The bulk of the sales were at $35@55; occasional singles $60@70 but stock equal to the latter in quality is worth about as much in the interior for new milk.

VEAL CALVES.—Receipts for the week 2024 head, do last week, 2740 do.; choice N. J. and Bucks Co., live 7½@8c. good state 7c.; other 5@6¼c. Hog dressed, calves at West Washington market prime 8@8½c.; common 5¾@7c. Receivers dislourage further shipment, the weather begins to hurt dressed stock. The demand has been only fair.

SHEEP AND LAMBS.—The market has ruled dull and prices have been in buyers' favor. Thin unshorn Colorado sheep 3½c rough Missouri 4½c; price to prime Western and State 5¾@6¾c. A car load of fine western taken for export at $81¼ per 100; clipped sheep sold at $4.50@4.88 per 100; fair to choice yearlings 6¾@7¾; fair to good spring lambs $4.50@5.80 per head, southern lambs sold at 8@10c. lb.

SWINE.—Receipts for the week, 29,748 head; do. last week 27,326 do. Ohio hogs 170 lbs., average sold at 3¾c. The week's trade was broken by the closing of Change on account of Good Friday. Country pork 5@5½c.; medium 5¼@5¾, light. State must be killed here to realize above figures.

***WEAK LUNGS** are cruelly racked, and the general strength gradually wasted by a persistent Cough, which Dr. Jayne's Expectorant may be relied on to cure. It will certainly benefit you also, if troubled with either Asthma or Bronchitis.*

Reading for the Young.

THE SUNSHINE'S CALL.

"WAKE up little daisies, awake,"
The sunshine stooped warmly to whisper;
"Come daffodils, sleeping so late,
And bluebell, sweet hyacinth's sister.
Shy violets, bright eyes unclosing,
Creep under gay peony's shade;
Pale primrose in white drifts reposing,
Narcissus so dainty and staid,
Break, lilacs, break into glad blossom,
Toss the wealth of your spicery plumes;
Old apple boughs clustering so gladsome,
Fill the air with your subtle perfumes.
Come over the hills and the meadows,
O clovers, with blooms red and white,
Hide under the beeches and hedge-rows,
Fairy lady slippers so white.
Come cowslip and tulip and lily,
Sweet dwellers in garden and field;
White roses swaying so stilly,
Red roses that blush as they yield.
My sweethearts come over, come over,
The grasses are green for your feet;
Bees sigh for the breath of the clover,
And droop for the lily-cups deep.
On sweet lips I long to press kisses.
In sweet hearts I long to lie hid,
To be steeped in the magic of blisses
That fold under pink and white lid.
So wake, my flower darlings, nor linger,
Brave crocus is leading the way,
I have banished the cold chill of winter;
Come bloom and be glad while you may."

[*E. T.*

A SWISS COUSIN.

UNCLE TRUE:—Perhaps I am too old to get enlisted in the friendly circle of your Cousins whose letters I read very often with great pleasure, but having not quite attained the lawful age required to act as man in political questions, I regard myself still as a boy and will risk a refusal as a Cousin from your young folks. In the first place, I will make you, Mr. Editor, and all our Cousins acquainted with my history up to this date, as most of the Cousins do when they apply for admittance into the Cousin family circle.

Born in Schaffhausen, Switzerland, I have passed away the early years of my existence just as you generally do here, with playing, going to school, etc. When I was twelve years old I passed the examination to enter the college of my native city, where I remained three years, during which I learned the first lessons in modern and ancient languages, in theology, astronomy, geometry, philosophy and natural sciences. During that time I had the ardent desire to acquire a thorough knowledge of French and English, which two languages are used not very seldom in the German part of Switzerland by American and English travelers who spend there the summer, admiring the beautiful scenery of lakes and rivers, climbing the famed Alps to cool their feet in eternal snow, or restoring their health in the numberless watering places of Switzerland. My parents helped me in my purpose and, supplied with sufficient funds, I went to Lausanne, on the Geneva Lake, and from there to Paris, where I succeeded in learning the French language throughout, frequenting in both places higher schools. Returned back home again after a two-years' absence, I decided to follow my parents' business, which consists in farming, and having heard and read so much about the American mode of agriculture, I took the resolution to go myself to America for the purpose of learning that branch of science practically.

It is now exactly three years since I took that resolution, and five weeks afterwards I found myself landed safe in New York without any friends or relations; nobody could understand my German and I could not understand or talk English. After a hard struggle I found a Frenchman to whom I complained of my desolate situation and asked him for further advice; my money made him take some interest in me and we started together for Montreal and from there to Plattsburgh, N. Y. Very soon he found occupation for me in that place on a large farm and he hired me out to the proprietor of it for a whole year. My new master could talk only English and consequently it was a hard task for me to get along; but natural pluck surmounted all the difficulties. The first week of my new career, when my master wanted something to be done, he was obliged to get some French-talking individual to interpret his orders to me, and plenty of mistakes happened quite often. After I worked the time I was engaged for out, I was offered a more favorable situation by a gentleman I am living with at present, and I accepted it. Last winter I went to school and improved considerably in the English language; of course, I make yet, from time to time, some mistakes in writing or speaking English, as you may find out in the present letter.

Mr. Editor, I wish you would excuse this long letter with nothing but personal items in it, but if the Cousins should like it, I would be very willing to write to them the next time about farming and other matters in Europe or Switzerland especially, to which country I shall return next fall. Anyhow, I am decided to take Friend RURAL with me and keep up through him communication with "Young America."

Clinton Co., N. Y. JOHN SCHROYN.

[I print our new "Cousin's" letter almost entirely as it was originally written, because it seems to *me* an admirable thing to have mastered the English tongue as well as he has in the short time he has been permitted by circumstances to apply himself to the task. I am sure I can welcome him heartily to our columns in the name of myself and my young relatives, and trust he will write often, telling us of his home and his European experiences. If he returns to Switzerland, we may be permitted to express the hope that it will be only for a temporary sojourn, and that instead of farewell, we may say *au revoir*. U. T.]

THE GIRL EVERYBODY LIKES.

M. E. STONE.

SHE is not beautiful—Oh no! nobody thinks of calling her that. Not one of a dozen can tell whether her eyes are black or blue. If you should ask them to describe her, they could only say, "She is just right" and there it would end.

She is a merry-hearted, fun-loving, bewitching maiden, without a spark of envy or malice in her whole composition. She enjoys herself and wants everybody else to do the same. She has always a kind word and pleasant smile for the oldest man or woman, in fact, I can think of nothing she resembles more than a great sunbeam which brightens everything it comes in contact with!

All pay her marked attention, from rich Mr. Watts, who lives in the mansion on the the hill, to negro Sam, the sweep. All look after her with an admiring eye and say to themselves. "*She* is just the right sort of a girl."

The young men of the town vie with one another as to who shall show her the most attention, but she never encourages them beyond being simply kind and jolly; so no one can call her a flirt: no, indeed, the young men would deny such an assertion as quickly as she.

Girls,—wonderful to relate—like her too! for she never delights in hurting their feelings or saying spiteful things behind their backs. She is always willing to join in their little plans and assist them in any way. They go to her with their love affairs and she manages adroitly to see George or Charlie, and drop a good word for Ettie or Minnie, until their little difficulties are all patched up and everything goes on smoothly again,—thanks to her.

Old ladies say she is "delightful." The sly witch knows how to humor them. She listens patiently to complaints of the rheumatism or neuralgia, and then sympathizes with them so heartily that they are half cured.

But she cannot be always with us. By-and-by a young man comes from a distant town and marries her The villagers crowd around and tell him what a prize he has won, but he seems to know it pretty well without any telling, to judge from his face. So she leaves us, and it is not long before we hear from that place. She is there the *woman* everbody likes.

The Puzzler.

Sabbath Reading.

THE LITTLE MAID THAT SLEPT.

SOMBRE folds the windows shroud,
Phantom figures come and go—
Hearts that must not break too loud,
Muffled footfalls, whispers low,
Cool deft hands—about a bed
Where, 'neath fever's scorching sway,
Lies a little restless head,
Tossing, tossing, tossing aye.
But the hour of fate draws nigh,
And the mid-sun overhead
Shrieks and drops from out the sky—
Yea, the child is dead!

But she lies so dimpling-fair,
In her bed-gown long and white,
With her waves of heavy hair
Drowning neck and shoulder bright,
With the flower-lips just apart,
Half way budded to a smile—
Pure young heart, O sweet child heart,
Hardly smirched with human guile!
Life so bright on cheek and brow
And those thin white lids of hers—
Fancy whispers, "Softly now,
Softly—see, she stirs!"

But the twin hands fairy small,
Crossed above the bosom's snow,
Never rise and hang and fall.
With the breath's soft ebb and flow.
Yea, the breaking mother heart,
Throbbing close, in anguish prest,
Vainly would its warmth impart
To the blue-veined marble breast;
Kisses win no kissed reply.
Yea, the pet name softly said
Lures no smile to mouth and eye—
Truly, she is dead.

* * * * * *

First to heaven He turns His eyes
One long moment, as in prayer,
Then upon the maid that lies
Wrapt in slumber still and fair,
Lo, His hands just touch her clay;
"Little maiden, wake, arise!"
And the sharp sweet light of day
Smites in lightning on her eyes,
And the blood's swift tide again,
Like a stream its chain that breaks,
Sings through every tingling vein,
As she sighs, and smiles, and wakes,
Lips that laugh and eyes that weep,
Throat that thrills with stifled scream!
Little maiden, thou didst sleep—
Oh, to know thy dream!

[*Good Words.*

A DAY IN THE LIFE OF JESUS.

Luke ix, 10, 17.

The work to be done for the bodies of men was accomplished, and there yet remained some hours of the summer's day unconsumed. The power and goodness displayed in this miraculous healing, would naturally predispose the people to listen to the instructions of the Saviour. This was too valuable an opportunity to be lost. Our Lord therefore proceeded to speak to them of the things concerning the kingdom of God. We can seem to perceive the Saviour seeking an eminence from whence he could the more conveniently address this vast assembly. You hear him unfold the laws of God's moral government. He unmasks the hypocrisy of the Pharisees; he rebukes the infidelity of the Sadducees; he exposes the folly of the frivolous, as well as of the selfish worldling; he speaks peaceably to the humble penitent; he encourages the meek, and comforts those that be cast down. The intellect and the conscience of this vast assembly are swayed at his will. The soul of man bows down in reverence in the presence of its Creator. As he closes his address, every eye is moistened with compunction for sin. Every soul cherishes the hope of amendment. Every one is conscious that a new moral light has dawned upon his soul, and that a new moral universe has been unveiled to his spiritual vision. As the closing words of the Saviour fell upon their ears, the whole multitude stood for a while unmoved, as though transfixed to the earth by some mighty spell; until, at last, the murmur is heard from thousands of voices, "Never man spake like this man."

But the shades of evening are gathering around them. The multitude have nothing to eat. To send them away fasting would be inhuman, for divers of them came from far, and many were women and children, who could not perform their journey homeward without previous refreshment. To purchase food in the surrounding towns and villages would be difficult; but even were this possible, whence could the necessary funds be provided? A famishing multitude was thus unexpectedly cast upon the bounty of our Lord. He had not tempted God by leading them into the wilderness. They came to him of themselves, to hear his words and to be healed of their infirmities. He could not "send them away fasting, lest they should faint by the way." In this dilemma, what was to be done? He puts this question to his disciples, and they can suggest no means of relief. The little stock of provisions which they had brought with them was barely sufficient for themselves. They can perceive no means whatever by which the multitude can be fed, and they at once confess it.

The Saviour, however, commands the twelve to give them to eat. They produce their slender store of provisions, amounting to five loaves and two small fishes. He commands the multitude to sit down by companies on the grass. As soon as silence is obtained, he lifts up his eyes to heaven, and supplicates the blessing of God upon their scanty meal. He begins to break the loaves and fishes, and distribute them to his disciples, and his disciples distribute them to the multitude. He continues to break and distribute. Basket after basket is filled and emptied, yet the supply is undiminished. Food is carried in abundance to the famishing thousands. Company after company is supplied with food, but the five loaves and the two fishes remain unexhausted. At last, the baskets are returned full, and it is announced that the wants of the multitude are supplied. The miracle then ceases, and the multiplicaton of food is at an end.

But even the provident care of the Saviour is manifested. Although this food has been so easily provided, it is not right that it be lightly suffered to perish. Christ wrought no miracles for the sake of teaching men wastefulness. That food, by what means soever provided, was a creature of God, and it were sin to allow it to decay without accomplishing the purpose for which it was created. "Gather up the fragments," said the Master of the feast, "that nothing be lost." "And they gathered up the fragments that remained, twelve baskets full."

Dissimilar as are our circumstances to those of our Lord, we may learn from this latter incident a lesson of instruction.

We can more easily maintain ourselves in the most difficult position, God being our helper, than in apparent security relying on our own strength.

From this portion of the narrative, we may, I think, learn that if we act in faith, and in the spirit of Christian love, we may frequently be justified in commencing the most important good work, even when in possession of apparently inadequate means. If the work be of God, He will furnish us with helpers as fast as they are needed. In all ages, God has rewarded abundantly simple trust in him, and has bestowed upon it the highest honor. We must, however, remember the conditions upon which alone we may expect his aid, lest we be led into fanaticism. The service which we undertake must be such as God has commanded, and his providence must either designate us for the work, or, at least, open the door by which we shall enter upon it. It must be God's work, and not our own; for the good of others, and not for the gratification of our own passions; and in the doing of it, we must, first of all, make sacrifice of ourselves, and not of others. Under such circumstances, there is hardly a good design which we may not undertake with cheerful hopes of success, for God has promised us his assistance.

Perhaps, also, we may learn from this incident another lesson. If I mistake not, it suggests to us that in works of benevolence we are accustomed to rely too much on human, and too little on divine aid. When we attempt to do good, we commence by forming large associations, and suppose that our success depends upon the number of men whom we can unite in the promotion of our undertaking. Every one is apt thus to forget his own personal duty, and rely upon the labor of others, and it is well if he does not put his organization in the place of God himself. Would it not be better if we made benevolence much more a matter between God and our own souls, each one doing with his own hands in firm reliance on divine aid, the work which Providence has placed directly before him? Our Lord did not send to the villages round about to organize a general effort to relieve the famishing. In reliance upon God, he set about the work himself, with just such means as God has afforded him. All the miracles of benevolence have, if I mistake not, been wrought in the same manner. The little band of disciples in Jerusalem accomplished more for the conversion of the world than all the Christians of the present day united. And why? Because every individual Christian felt that the conversion of the world was a work for which he himself and not an abstraction that he called the church, was responsible. Instead of relying on man for aid, every one looked up directly to God, and went forth to the work. God was thus exalted, the power was confessed to be his own, and, in a few years, the standard of the cross was carried to the remotest extremities of the known world.

With such facts before us, we surely should be encouraged to attempt individually the accomplishment of some good design, relying in humility and faith upon Him who is able to grant prosperity to the feeblest effort put forth in earnest reliance on his almightiness.

Such were the occupations that filled up a day in the life of Jesus of Nazareth. There was not an act done for himself; all was done for others. Every hour was employed in the labor which that hour set before him. Private kindness, the relief of distress, public teaching, and ministration to the wants of the famishing, filled up the entire day. Let his disciples learn to follow his example. Let us, like him, forget ourselves, our own wants, and our own weariness, that we may, as he did, scatter blessings on every side, as we move onward in the pathway of our daily life. If such were the occupations of the Son of God, can we do more wisely than to imitate his example? Every disciple would then be as a city set upon a hill, and men, seeing our good works, would glorify our Father who is in heaven. "Then would our righteousness go forth as brightness, and our salvation as a lamp that burneth."

TEMPTATIONS make Christians more serviceable and useful to others. None so fit and able to relieve tempted souls, to sympathize with tempted souls, to succor tempted souls, to counsel tempted souls, to pity tempted souls, to bear with tempted souls, and to comfort tempted souls as those who have been in the school of temptation.

PERSONAL ITEMS.

Cluseret, the Communist general of 1871, is believed to be in Persia, drilling the Shah's troops.

The Emperor of Austria's father, the late Archduke Francis Charles, left a third of his estate of $12,000,000 to the poor.

Mr. Tennyson received for his ballad, recently published in the Nineteenth Century, the sum of $1575, and its a rather second-rate poem at that—for him.

Pope Leo sends this word to the tramps and beggars who call at the Vatican for alms: "It is God's will that man should earn his bread by the sweat of his brow."

General Joe Lane, Democratic candidate for Vice-President on the ticket with Breckinridge in 1860, is now a hale and hearty veteran of 77 years, enjoying life at his beautiful mountain home in Douglas county, Oregon.

John Ruskin has started a new Socialistic society called the Guild of St. George, among the tenets of which is that every member will strive to love his neighbor as himself, and, even when he cannot, will act as if he did.

An English peeress, the Viscountess of Kingsland, was recently discovered living in direst poverty in London. Lord Beaconsfield has recommended a grant from the royal bounty fund of $500 to the distressed lady.

The Count de Chambord, known as an aspirant for the throne of France, under the title of Henri V., has bought a small island in the eastern Mediterranean for his winter residence, where he can be monarch of all he surveys, with no one to dispute his title.

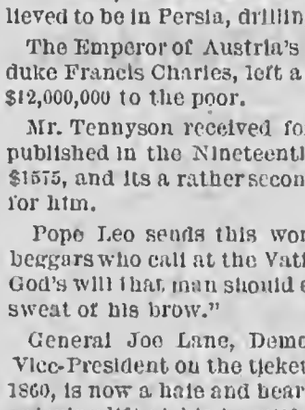
Leo XIII. has three brothers. Carl is eighty-eight-years old, bed-ridden, and apoplectic; Johann is the head of the family; the third is an ex-Jesuit and secular priest. Besides the Pope has two married sisters and a nephew, who is a volunteer in the Italian army.

The new Doorkeeper of the house of Representatives, Gen. Charles W. Field, is six feet three inches high, admirably proportioned and a handsome man. If his countenance does not belie him, and the science of phrenology is not at fault, when he says a thing he means it, and will stick to it.

Dr. Mary Walker was once a Mrs. Miller, but twenty long years ago she freed herself by a divorce from the restraints of matrimony, set the wayward Miller adrift and donned the trowsers herself. Beneath an odd and brusque exterior she carries a patrotic heart, and for valuable services rendered during the war, Congress voted her a gold medal.

Instead of dying in "a dark, damp cell," Tweed's room was a large and comfortable apartment on the first floor of Ludlow street jail, well and comfortably furnished, and was supplied with an abundance of books and papers, which afforded the prisoner abundant entertainment during his leisure hours. His beard and hair had turned snow-white and his face was very thin, but the dimensions of his figure had not been perceptibly reduced.

Implements and Machinery.



LIVINGSTON & CO.'S
SICKLE GRINDERS.

Price $10.

Every owner of a Mowing Machine should have one.

They pay for themselves in a single season.

N. B.—The first 500 machines will be sold at $7.50 each.

Boston, Mass.

Wit and Humor.

SPARKS AND SPLINTERS.

THE St. Louis Journal peacefully pipeth the pleasures of house-cleaning thus:

"The housekeeper giveth a cheerful hop,
And we hear the musical flipperty flop
Of the moisty, misty, maddening mop.

And lo, the maddening horrors rush
Athwart our souls at the soapy gush
Of the slippery, slimy scrubbing brush.

From early morn till evening gloom
We hear the scratching in hall and room
Of the boisterous, busily-bobbing broom.

And now there cometh a woesome wail—
That augurs a gen'rally gusty gale—
From a man with his leg in the scrubbing pail."

MAN proposes, but—he is not always accepted. —*Camden Post.*

THE death of the Pope, it is said, caused over a million pairs of black gloves to be sold in Paris. [EX.—Proving that His Holiness was mourned on all hands.—*Phila. Bulletin.*

A Florida negro mistook a mule for a ghost and poked it with a stick. The verdict recited that he came to his death by using too short a stick in probing the unknowable for evidences of a future existence.

Do you believe in the use of the rod, my dear Professor?" asked a lady whose children were making life a burden to all the guests in the hotel. "In some cases, madam; but there are others," glancing at her gambolling darlings. "where I prefer the revolver."

"Where was Bishop Latimer burned to death?" asked a teacher, in a commanding voice. "Joshua knows," said a little girl at the bottom of the class. "Well," said the teacher, "if Joshua knows, he may tell." "In the fire," replied Joshua, looking very grave and wise.

THE future of the phonograph.—Ardent lover: You ask for some proof of my affection, my devotion. What proof can I offer you? Stay! I have it! I am ready to breathe my vows into the Young Lady's Best Companion, or Breach-of-Promise-Self-Registering-Evidence-Phonograph.

THE early strawberry, at a dollar a quart, puts on aristocratic airs and looks with scorn and contempt upon hungry humanity. By July he will get down from his lofty eminence and hide himself between the strata of a fifteen-cent saleratus short-cake, and howl for a customer.

AN old, rough clergyman once took for his text that passage of the Psalm, "I said in my haste, all men are liars." Looking, apparently, as if he saw the Psalmist standing before him, he said: "You said it in your haste, David. If you had been here, you might have said it after mature deliberation."

An exchange says that a new way of fastening on ladies' hats is to bore the tops of their ears, put in gold hoops and have the hat strings tied through them. Thus, step by step, we tread the pathway to perfection, and ere the darkness of death envelops all the world man will have utilized his nose in holding up his pants or pulling on his boots.

Alternately Shaken and Scorched

By the paroxysms of chills and fever, the wretched sufferer for whom quinine has been prescribed essays in vain to exterminate the dreadful disease with that hurtful palliative, which at best only mitigates the violence of the fits, and eventually proves highly injurious to the system. In order to effect a *thorough cure* of malarial fever, whether intermittent or remittent, or to render the system impregnable to its attacks, Hostetter's Stomach Bitters should be used daily. That this medicine is a searching eradicant of diseases generated by miasma, and a reliable safeguard against them, is a fact so widely recognized in this and other countries that to adduce evidence in support of it is unnecessary; but were it either essential or desirable to do so, it may well be supposed that from the testimony corroborative of its claims, which has been accumulating during the last twenty-five years and over, sufficient proofs might be gathered to convince the most inveterate skeptic.

STOCKBRIDGE
MANURES

Originated by Prof. Stockbridge, Prof. of Agriculture in the Massachusetts Agricultural College.

Made for each crop, furnishing the plant food which each requires. They have been used for five years with such success that in 1877 they were applied on over 10,000 acres with excellent results. **Send for Pamphlet, Mailed Free.** Also for sale, Agricultural Chemicals.

Horticultural.

A BOWER.

We offer the accompanying sketch as a beautiful effect produced at little cost, and one that any farmer that can see beauty in a flower, shrub or vine, can reproduce about his own home. Such delightful, shady, inviting nooks are far too infrequent in our American gardens.

We are too fond of imposing artificial effects that display wealth rather than that homelike, quiet, generous arrangement of plants, lawns and walks that is suggested by a love of home, and refined taste, untutored though it be.

There are many hardy vines suitable for such arbors as that represented in the engraving. Either one, or several, might be planted in one small plot and trained for two or three seasons to a central column, and then carried over upon wires or light frames of any kind. The hardy Akebia quinata would answer the purpose admirably. The Wistaria, Periploca Græca, Honeysuckles, Virginia Creeper would answer the purpose separately or together. For a single vine, however, for this climate, we think of none that we should employ for this purpose in preference to the old and well-tried Trumpet Flower, Tecoma radicans (see page 281). This is very hardy, of rapid growth, and attaches itself by its leathery rootlets to whatever it touches.

THINNING AND DIGGING.

With amateurs and in many cases with professional gardeners, it is usual to plant the shrubbery borders very close. In most cases no harm, but much good comes of thick planting, if timely thinning is practiced. As soon as it becomes apparent that they begin to crowd each other, some of the plants must be removed. This is imperative and, in so removing, the especial welfare of the plants left rather than the good of those removed, should be carefully studied. The reverse of this is the usual practice with quite all gardeners, the thinnings must be cared for and made to grow at all hazards, and without regard to the loss of roots to the remaining plants.

These remaining shrubs, as is too often the case, instead of being improved by the thinning as is intended, date their decline from that time forth. The reasons for this, (and there are several,) should be apparent to any observer. In the first place, plants growing closely together naturally protect each other; it follows that after a free thinning, the plants left get chilled, arresting growth and impairing their constitution. This is the result of the thinning being carried to excess; a little at a time is the only safe rule, and one which should never be forgotten for a moment while at work in the shrubbery.

Will it be necessary to speak of the second reason for the decline of thinned shrubs? It is the wholesale loss of roots. In our endeavor to get a good ball of roots for the removed plants, we cannot help doing considerable damage to the roots of those left. Does it pay to try and save the thinnings? Most certainly not, when it has to be done at the risk of destroying the remaining plants.

Another great wrong is done to the shrubbery by the semi-annual digging practiced by two-thirds of the gardeners. Hardly have the roots made a fair start in the surface soil, when down must go the spade and cut them off. What is the use of manuring and mulching, if we must cut the roots off every fall and spring, as soon as they get a fair start to work. I do not say the weeds must be allowed to roam and flourish. The surface should be kept clean by hoeing the weeds when small, and the crust should be kept from baking by the judicious use of the rake, but no spade should touch the ground between the shrubs. If necessary to loosen the soil, do it once a year with a strong garden fork. Much injury is also done to our shrubbery by improper pruning and trimming, but of this time and space will not allow me to speak. It is a wonder how some plants have ever thrived, subject to the cruel and barbarous treatment that has been given them. Study the welfare of your plants if you would succeed.

Arboricultural.

WHAT SHALL I PLANT? No. 2.

SAMUEL PARSONS.

In my last paper I noted briefly some of the best flowering plants for massing or using singly on the lawns. Flowers appeal to the most careless eye, but very many enjoy as they pass the varied colors of foliage without understanding or even thinking why they receive such pleasure. By touching here and there, briefly, on certain deciduous tress and shrubs remarkable for foliage of attractive shape and color, I hope to indicate somewhat how this agreeable effect is produced on well-planted lawns.

The Maples rank especially high, not only on account of their vigorous and rapid growth and general health, but also from the varied forms and color their leaves assume in the different varieties. These massed together or planted singly, present rich and delicate hues quite unsurpassed in their way. The Sugar Maple is perhaps the best known and appreciated even in its most purely ornamental character for its autumnal garb of crimson and gold. Then there is the Norway with broad, shadowing foliage, well suited for single positions on the lawn, or for skirting the edges of other groups in clusters of two or three. The Scarlet is honorably known for the unrivaled coloring of its robes in fall. Both good in their way, the Silver-leaved and Ash-leaved, with their light or fresh-looking foliage, have a minor degree of value for lawn planting, although still very useful in their way.

By grouping these Maples with the Scarlet or Pin Oak and Liquidambar most effective combinations may be formed for the exhibition of fine autumal coloring, and I only wonder that more attention is not given to this branch of lawn planting. I would like to dwell at length, did space but permit, on the exquisite beauties of the Japanese Maples with their lace-like leaves, golden, purple and tri-colored. This much must be said for them, that no lawn can dispense with their hardy beauty, any more than it can spare the peculiar fitness their dwarf nature gives them for certain positions near the path or house.

The cut-leaved and purple forms of the White Birch have great value for the lawn planter. In the true sense of the word elegant, their white bark stands out among other trees with great prominence and the drooping, graceful foliage relieves the shores of lakes or edges of woodland with great effectiveness.

For sturdiness, for richness and massiveness, nothing can much surpass the different varieties of Beech, Purple and glowing, cut-leaved, symmetrical, and weeping with great irregular sweeps of the branches, all habits seem to afford it new capacity for astonishing us by its noble and varied forms. Nor must we forget that the shade cast by the Beech has been esteemed specially delightful from early classical days.

The sturdy qualities of the Oaks also recommend them highly for lawn planting. Their outlines and curiously-formed branches and leaves render them always picturesque, and their longevity is almost unsurpassed. Maturity with them does not come early, but their grand and even elegant forms remain with us so comparatively unchanged that they seem at last part of ourselves, something that we have always with us, like the "everlasting hills." Quite as much as other trees, they take on purple, and golden, cut-leaved or weeping forms. Indeed Quercus concordia is one of the most permanent and best golden trees we have. There are two purple forms of Oaks: one, nigricans, grows well and is hardy, but does not retain the purple strongly-marked throughout the summer; the other, atropurpurea, is rare, richly and permanently colored, of very slow growth, though not very hardy while young, in many sections of America. The Scarlet Oak is well-known for its fine autumnal coloring.

Not common, and of very rich coloring is the Purple-leaved Hazel. Then we have the Liquidambar, just now of "Alligator Tree" celebrity, with its star-shaped leaves and dark-red color in autumn, and the Kilmarnock Willow, of light foliage and regular weeping form, but defective longevity.

I must, however, conclude my brief remarks by noticing only two more very ornamental genera of trees: the Lindens and Cypresses or Taxodiums. The Linden is silvery, symmetrical and massive, golden-twigged, shining and graceful, but always a tree of very great beauty and value. Cypresses are not appreciated. There is nothing among trees more graceful than their weeping curves, or more delicate and elegant than their light colors and feathery foliage, especially in the forms termed Weeping and Chinese. Elms certainly deserve, at least, a passing notice, but most varieties are quite familiar, except probably the Weeping Slippery Elm, the vigorous growth and persistent, healthy foliage of which give it a value hardly at all, as yet, recognized. I might mention many curiously formed and colored shrubs, such as Purple Berberry, Japan Silver-leaved Oleaster, Sea Buck-thorn and variegated Wiegela, did space permit me.

LAWN OR GARDEN BOWER.

JAPAN PERSIMMON.

Whatever may be said against the hardiness of the Japanese Persimmon throughout the North, and very little is really known of the matter, this much is certain, that for the South it is going to prove a valuable acquisition. Careful notes should be taken, in various lo-

calities, relative to its hardiness, health, etc., and forwarded from time to time, to the leading horticultural journals. We have tasted the candied or dried fruit of the Japanese Persimmon lately with much satisfaction and appreciation of its toothsome qualities. Excelling the dried fig in flavor, it is richer, reminding one somewhat of the date, whence arises probably, one of its names, the Date-plum. S. B. P.

Field Crops.

CULTURE OF BROOM-CORN. NO. 2.

W. H. WHITE.

HARVESTING ETC.

We here come to a point in broom-corn culture where the practices of different cultivators vary somewhat; still all aim to attain the same end, namely the best brush. Some break the stalks a foot or more below the brush some little time before cutting, after it has matured to the stage they think proper, and let the brush hang, tips down, beside the stalks. Others "table" it, which consists in breaking two rows together about two feet from the ground, laying the tabled portion horizontal with the ground, some two feet above it. Others again, let it stand as it grows till time to cut, and then cut as it stands. Others still, break down only the crooked brush, and leave the rest till a day or two before cutting, when the stalks are all broken to hang one way, usually toward the rising sun.

I believe all are agreed that if the stalk is bent or broken over without entirely severing it from the root, previous to mature growth, the brush will not grow in length, but will grow coarse and harsh. It is always an object to have the least possible amount of crooked brush, as it is usually coarse and difficult to work to advantage. This usually detracts from the value of an otherwise desirable lot. Broom-corn should be harvested before hard frosts, as frost injures it materially; and for this reason, in our northern climate, it is essential to give it good early culture, to induce an early, rapid growth and maturity. It is also necessary to give it good soil well warmed up with well-decomposed manure, ready to impart pabulum as needed by the young plants, which are somewhat tender.

As good a course as any, in harvesting broom-corn, is, I think, to let it grow till a day or two before cutting, which should be done when the major part of the seed is in the dough state, none fully hard, as then the brush is in the best condition and will bring the best price, if properly cured, etc. Then "table" it, which is done as above described. After a day or two, cut the brush, using a butcher or a carving-knife, not very keen-edged, for if it is not so sharp, the leaves are less likely to be cut off and bothersome. Cut so as to leave only six or eight inches of stalk below the point where divergence commences, keeping clear of all leaves, laying the brush straight all one way; spread on the "table" formed by the stalks. A good deal of labor and vexation is saved by keeping, in every manipulation, the brush even and straight, not thrown together like hay. After lying awhile to dry somewhat, the brush should be gathered into small bundles and bound with corn-leaves or other tying material. It should then be hauled and spread under cover on the day it is cut. Thus cured it keeps a better color, and the brush retains its elasticity better. A greenish cast of color suits some markets best: this is best attained by cutting before fully ripe, and directly hauling it and curing it under cover of sheds or well-ventilated, airy buildings. It should be spread on racks suitable for the purpose. These may be set up to any convenient hight, and formed of open slats one above another with a space of a foot between.

Our next step, after the brush is well cured, is to divest it of the seed. This is acomplished in different ways by different cultivators, the method depending somewhat on the quantity grown, conveniences, etc. Some take two pieces of hard-wood board, with square, sharp edges; one may be of any desired length and fastened conveniently edge-up; and the other of a convenient length to hold in one hand. The brush is taken by the stems, in the left hand, and drawn through between the edges of the two boards, the one in hand being pressed on the brush, and turned a little to allow the corners to strike the seed. Quite rapid work may be accomplished by an active man in this way. Others take an iron scraper and use it in a similar way. Some use a broom-corn hatchel, which consists of a row of iron teeth, three-eigths by one-half an inch square, six to eight inches long, two-thirds their length beveled to a point, the back side thicker than the front. Set the teeth firmly in a plank, so that the points will be about half an inch apart. This can be fastened to something firm and convenient to work at, then draw the brush through the comb till clean of seed.

Where the quantity is large, a cylinder made for the purpose, some two feet long and ten or twelve inches in diameter, with teeth three inches long and one-fourth of an inch square, pointed and set in rows three-eights of an inch apart in the cylinder, and this driven by horses or other power, is used and made to do rapid execution. This works overshot with a concave; four or more hands can work at it—two to hold the brush to the machine, while two others prepare and hand it for cleaning; a fifth will find full employment in taking away and binding or spreading again the brush after the seed is off. If the brush is not fully dried out, it should be again spread on the racks to dry fully, so that it can be put in bulk or bales without danger of heating or molding, etc. After suitable drying, it is made into bundles of about ten pounds, butts out and the brush lapping. These bundles are well compressed and firmly bound with strong twine or other tying material. It may now be put in larger bales and sent to market, or sold and delivered without baling, to the manufacturer when near-by.

TETOFSKY.

The profits of growing broom-corn are variable, depending upon supply and demand. There is always demand, however, and at remunerative prices when the market is not already stocked with the raw or manufactured article. Some seasons, in the past, I have known the price to go as high as twenty or twenty-five cents per pound, and even more; while in others, when the supply was large, the price fell to six cents or less. The product per acre also varies with different seasons and also with the culture given; but with such culture as before recommended, and a suitable rotation, never growing the crop two successive seasons on the same ground, or planting to follow sorghum, the crop may be as sure, nine times in ten, as Indian-corn, and the cost of production but very little greater, while it will bring considerably more, as prices generally average.

If all the directions hitherto given are followed with judicious closeness, an average product of marketable brush of eight hundred pounds should be obtained with fifty bushels of seed which will be worth for feeding purposes, ordinarily, as much per bushel as oats, or even more. With this product as a basis, anyone can estimate the income from an acre from prices in his own locality. I have here understated, rather than otherwise, the products realized under favorable circumstances of good seasons.

My aim has been to give a fair average, rather under than over, of the results for a number of years in my own vicinity where my experience and observation have extended and where thorough culture is the rule.

Worcester Co., Mass.

THE USES OF MILLET.

Millet has often been recommended as a forage plant, for which it has special advantages as it can be sown late in the season when the other crops are out of the way. It may be successfully grown upon land too wet for putting in oats or other early spring crops, or it may be sown on land after a crop of barley or grass has been gathered, and mature sufficiently for forage. The common millet will ripen its seed within sixty days after sowing and it will then make good hay, besides affording a large quantity of seed valuable for poultry, or, if ground, excellent to mix with corn or other grain to feed to cattle and pigs. The seed of millet is worth all the crop costs to raise, leaving the hay for a profit. As the crop can be put in and harvested at seasons of the year when other work does not press upon the farmer's time, its culture is made easier. It is an excellent crop to put upon a stubborn piece of ground to kill out weeds, such as thistles, dock, &c., for if the land is well plowed and the surface made mellow, the millet will soon shade it thoroughly and kill out the foul stuff. A little manure on the surface harrowed in with the seed will often double the crop. Time should be given to allow the seed to ripen before frost. The crop may be run through a threshing machine, or if bound up into bundles, threshed with flails to separate the seed. A half bushel of seed is abundant for an acre.

The Golden or German millet is the best for a forage plant and resembles corn in its growth, as it throws out a broad, corn-like leaf. The stalk is also soft and edible. This sort of millet requires nearly the entire season to mature its seed, and should, in a northern latitude, be sown by the first of June. For forage alone it may be put in the last of June when it will make full growth of stalk but not mature the seed. It requires stronger land than the common to make a vigorous growth. On rich land the amount of forage is immense. Stock will eat either of these grain-grasses with a decided relish in winter and they are most excellent for a change. For green feed they are also good. As a supplementary crop, when the meadows are light, millet is most valuable. A meadow with a slim prospect for hay might be turned over, and be made to yield a satisfactory crop by sowing to millet, and at the same time be fitted for a crop of grain the next year. If the frost holds off, the seed will not mature when the golden is sowed late, as it requires a requisite degree of heat which is not afforded after September. It should always be cut before any frost touches it, or its value for feeding will be greatly injured. Like corn, it blanches and dries off when frozen. The seed of Hungarian grass is not equal to millet for feeding stock. It is not much if any better than that of our native summer grass which it very much resembles. The latter which is often plentiful in a grain crop, is good for cattle if ground up and mixed with bran or meal. Fed alone it is too laxative.

YELLOW BELLEFLEUR.

VAN'S VIEWS.

GROWING POTATOES CHEAPLY, ETC.

One of the farm crops which we will soon be thinking of is potatoes, and our system of growing them has of late years been much simplified. In the Centennial year prices were so low that we had to seek new methods and endeavor to grow them cheaper. Those of us who said that potatoes could be grown at a profit, for twenty-five cents per bushel, received much abuse and were denominated "paper farmers" and other complimentary names. But time has brought changes and we hear men tell of their crops raised without using the hoe, which average fully as high and usually higher than those grown the old way.

There is no patent on our system and I will in brief explain it:

A plowman who can always strike a straight

furrow begins on one side of the field, lays out a land, "back furrowing," plows three rounds, turning a furrow as near as he can to twelve inches wide and six deep. He then lays out another, and after that a third, so that he can go from one to the other. A boy follows with the potatoes, cut to *single* eyes, and drops them in each third furrow about one foot apart; the next furrow, of course, covers them and our potatoes are planted. After the field is finished, harrow; when they are just appearing harrow again, and keep this up, till the potatoes are six inches high. This looks rough, but it agrees with the potatoes and we are satisfied. These harrowings keep the weeds down and the potatoes have now such a start that they will choke out any weeds in the row, and between the rows a shovel plow will keep things clear.

Now, don't go and try this plan on a piece of land "too poor to grow white beans," and then call us who follow it, humbugs; but take a *good* piece of sod or good land well manured, and plant *close* in the rows, and you will have no cause for complaint.

We also find the harrow very useful in our corn-field. Some think it does more harm than good, but it depends largely on the soil. On a heavy loam it is a success. Corn-growing is not a success with us for about one year out of five; we lose our crop by early frost.

Who has tried vetches as a soiling crop? Who has tried soiling anyway, and what has been his success?

We are just having our first spring rain and the faces of our lumbermen and farmers begin to assume their natural rotundity. The thought of a field or two that should have been sown, mars one's rejoicing in a measure, but, to change an old saying: "There's no great gain without some small loss," and our loss is small in comparison with the gain of the region about us.

Pomological.

CAN WE HAVE BETTER FRUIT.

No. 1.

GEN. W. H. NOBLE, BRIDGEPORT, CT.

WHY not! The ways are known if not well trod. Our glorious climate promises bright rewards to trial. It matters not that the best are due almost as much to chance as to any method in the selection of their seed. Excellence in a chance seedling is not all chance. Calling a choice fruit a chance seedling is only another way of telling our ignorance of the ancestry and parentage from which its excellence has sprung. All we know about the descent of fruits as well as of animals, makes it sure that before the birth of any choice variety its progenitors struggled through many generations of slow development. No one perfect thing whose history we know, has ever reached perfection at a leap. Whether left to the slow happenings of chance, or patiently sought through studious trials, it has taken many generations of men and tree growth to place a luscious fruit upon our table.

The Dutchesse d'Angoulemo and the Seckel, are chance seedlings. Many of like or near excellence have come by chance; were found in hedges or outlying lands. But all we know about how better fruits have followed patient trials, tells us that some unrecorded excellence has fathered the luscious fruit that comes by chance, as well as those whose parentage we know.

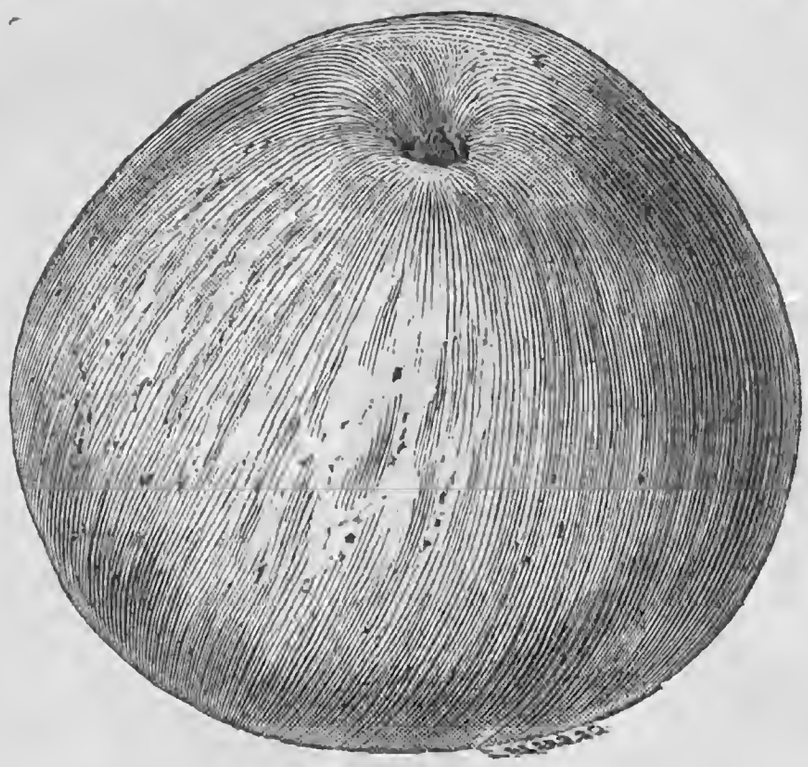
No old choke pear, self-impregnated, ever yielded, right from its puckery pulp, a seed from whose planting sprang fine fruits. Whether planted with method and a purpose, or by chance, such come only through seed one at least of whose parents bore a choice kind. The way may be unrevealed by which the choice seedling gets that in its germ which grows to excellence. Whether pollen floating in the air, or borne by bird or bee, or mated with a purpose, gained for our choice fruit its lightest type and promise, matters not. It's enough to know that races are only lifted to higher levels by that better blood which comes as a heritage through lineal heirship from some ancestral excellence.

The signal betterment of animal and vegetable kinds, which our century boasts, has come from faith in that heritage and close study of Nature's ways. That study has revealed but two methods through which Nature holds the good and helps to better kind. One is by straight, lineal family descent, in an unbroken line. The other seeks a better progeny through mating the choicest families in each race, which is cross-breeding.

Of these, the first is especially known on the turf and in the stock-yard as breeding in-and-in. This, as near as you can breed in-and-in through the seed germs and growth of trees, was the method in Van Mons great experiment after better fruits, at the gardens of Louvain. Some fifty years have gone by since the great Belgian gave us its results in many of our finest fruits. The story of his trial is a wondrous chapter in the history of the garden. Such profound knowledge of fruit-tree life, such heroic patience in toil and trials, such a triumphant harvest of luscious fruits, and then after a special term of generations for each kind from seed to fruitage, their failure to reward his method with better sorts, make up a rare record in human and plant life. His calm and philosophic register of that failure, the lucid story of the theory and phases of his trial, and the real wonders which he wrought, have won for Van Mons the homage and lasting memory of all to whom the garden is a pleasure and a pride.

It is true that cross-breeding alone insures both to animals and plants lasting and higher grades of excellence. Yet neither its more enduring results, nor the failure of Van Mons to fulfill the earlier promise of his method, should dim his glorious name among men. His gains upon the rude ancestry of his rapid generations record a wonderful feat. The failure in the lift toward higher and higher grades of tree and fruit only warns against his practice as a continuous method. It should not dishearten hopeful trust and search for special helps along the pathway of his trials. The glorious fruitage that crowned his work proves that somewhere beside his tireless footsteps there lurks a secret promise of brighter results. The cross-breeders glorying in the rich returns of their placers, have mostly passed by and forgotten the older diggings of Van Mons, and his methods of work.

Now Van Mons' theory and plan were these: he held that stalwart wood-growth and fine fruits were not congenial; that to repressed tree-growth came the better fruitage; that the progeny of old established sorts tended the most readily towards primeval crudeness; that rapid reproduction, therefore, from seedlings just taking to a better fruitage, would sooner return us luscious fruits.



THE WEALTHY APPLE.

So he began away back with seeds of healthy trees a little advanced from their aboriginal estate. The seed of this fruitage he planted right along in one unbroken line of strict family descent. By every means known to those skilled in the garden, he checked their wood growth and hurried up their fruitage. After several such hastened generations, varying with each kind, luscious fruits crowned his patient work. But after the number at which each variety reached its highest grade, both in tree and fruit, all promise of a better future failed.

Van Mons doubtless erred in many things. No special plan grasps all Nature's ways in animal or plant development. Yet starting without pioneer or guide, the brief years of his experiment out-stripped all that chance or skill had won through all the generations gone before. To few among men has such a triumph been vouchsafed, in any line of human effort. He deserves a high place among the benefactors of our race. Such are not, more than greatness, always to be measured by success. The world in every line of life owes more to the earnest struggles of the many whose failures have broken the way, than to the few who out of the dangers and toils of others, "have plucked the floweret of success." Besides, we often sadly err, both in our praise and estimate of men and of their work. Fame's wreath is ever ready for the triumphs of our baser nature. History makes much of wars and warriors, of state-craft and intrigue, of provinces overrun and people crushed out by rough riders. Not but that deeds of arms and heroic daring in defence of home and country and human liberty, merit praise; yet there are less boastful and noiseless human triumphs equally deserving the plaudits of men. Thus fruitage and flowers, the garden and gardenesque, are given small place among the forces lifting our race to higher levels of civilization. Yet when such factors get their true measure as motors toward human betterment, those like Van Mons will be rendered their rightful place in the hearts and ranks of men.—[To be continued.

CANADA REINETTE.

APPLES.

YELLOW BELLEFLEUR. PAGE 278.

That this is a popular apple the markets of the large cities will testify during its season. The tree likes a light soil, for which reason perhaps we have never been able to do anything with it in the RURAL Grounds which are rather clayey. The young trees seem to exhaust themselves in blossoming. No fruit has ever set and very little new wood formed. The apple is pale yellow. Flesh tender, fine, juicy, agreeably acid and excellent. The American Pom. Society gives two stars to the following: Nova Scotia, California, and one star to Vermont, Mass, Conn., Mich., Oregon, Penn., Md., Virginia, Ohio, Indiana, Kentucky, Iowa, Missouri, Nebraska, Utah, Ala., Louisiana.

THE TETOFSKY APPLE. PAGE 278.

This Russian apple has proved itself a valuable market sort. Fruit is of medium size, oblate, conic or sometimes quite round, yellow striped with red. Flesh white, sprightly, juicy, aromatic and agreeable. Ripens in August and succeeds well in Iowa and most of the northwestern states, and also in Louisiana.

WEALTHY.

Of medium size as our engraving shows, the Wealthy apple has white, fine-grained flesh which is tender and possesses a sprightly, subacid flavor. The tree is very hardy, originating in Minnesota. The fruit growers of Minnesota speak in high terms of praise of this apple. It is very showy and of good quality.

CANADA REINETTE.

A WINTER apple of medium size. It is a greenish-yellow color—flesh white growing tender, juicy and possessing a sub-acid, lively flavor. It has been found to do well in New York, Ontario, Michigan, Ohio, Alabama and Louisiana.

RAWLE'S JANET.

(*Rawle's Jennetting, Neverfail.*)

This for certain parts of the country, as will be seen below, is a valuable apple. The tree is of slow growth, but a great bearer though usually a part is under-size and knotty. Medium size, striped red and yellow. Flesh fine, juicy, crisp, rather acid. It is a winter apple and keeps well. The Am. Pom. So. gives two stars to the following: Maryland and D. C., Virginia, Kentucky, Iowa, Missouri, Kansas.

PROFITABLE PEARS.

YESTERDAY I asked a neighbor, who has grown several acres of pears for years, what variety he had found most profitable. His pear orchard consists mainly of four varieties; Bartlett, Seckel, Winter Nelis and Lawrence. It would have yielded thus far twice as much clear profit if all the trees had been Bartletts. Now, however, this variety is blighting badly, while some other kinds are coming in its place. The Lawrence is a poor bearer while young, but is healthy and more productive as the trees get old. My friend has not had such good success as he should in disposing of Winter Nelis, a late pear which needs to be sent to Boston, New York, or Philadelphia to secure a good market. Excepting the Bartlett, the Seckel is probably the best pear for profitable marketing. The tree is mostly free from blight, and the fruit, though small, is always in demand. There is this to be said in favor of the Bartlett that though it has blighted badly of late, the trees have paid for themselves before the others began to bear much. For quick returns there is no better variety. Beurre Clairgeau is a coarse, poor pear; but so fine-looking that it always sells well. Flemish Beauty, on the contrary, though equally fine-looking, is more apt to glut the market than any other. Much of the profit in orcharding depends on judicious selection of varieties. Other sections may need other favorites, but for Western New York the above hints will be of value.

Monroe Co., N. Y.

Farm Topics.

WESTERN FARM TOPICS.

PROFESSOR E. M. SHELTON.

THE impression exists in the minds of many Eastern people that the wheat crop which figures so prominently among the agricultural products of this State, refers wholly, or in good part, to the spring varieties. This is a mistake: the amount of spring wheat actually grown being little more than one-fourth of the total wheat product. Moreover, while the cultivation of winter wheat has increased enormously within a few years, the growth of the spring variety has made slow and uncertain progress. Thus—to quote from the Reports of the Secretary of our State Board of Agriculture—the product of spring and winter wheat of the State in 1870 was, in round numbers, something under 2⅓ million bushels of each sort, the yield of both kinds being then nearly equal; in 1877 the spring wheat product had only increased to 3½ million bushels, while that of winter wheat had risen to the enormous total of 10½ million bushels. All the "large yields" and "big fields" of wheat, so often mentioned in the papers, without exception, refer to winter wheat.

Within two years there have appeared many indications of a reaction in favor of spring wheat, and I am satisfied that during the present season a larger area has been sown to this variety than ever before in the history of the State. Some careful observers go so far as to assert that the area of spring wheat has been more than quadrupled the present season; and should a good crop be harvested the next two seasons, I should not be surprised to see the position of the two sorts nearly reversed. Thus rapidly do these young communities change their methods in this, the most conservative of arts.

There are several reasons for this change in the opinions of our farmers: the chinch bug, that pest of the spring wheat plant, has for several years done but little damage, while the winter wheat has for two years past been badly injured by rust and grasshoppers. But more than anything else, the introduction of the

ODESSA OR GRASS WHEAT

has tended to produce this change. This wheat may be familiar to your Eastern readers, but in this part of the State it has only been cultivated during the last two or three years, and then on limited areas. Of its origin and history I am unable to speak positively. Rumor assigns to the Agricultural Department the honor of having first introduced the seed into this section.

I am not prepared to indorse all the claims put forward for this variety; but certainly it has proved the most valuable spring wheat ever grown here, and in some respects superior to the winter sorts. It is claimed for it that it is proof against the chinch bug, at least it has not thus far been injured by this omnivorous pest, and that it is a more certain crop, and generally gives larger yields than any similar wheat. To these must be added a third and most important advantage—it may be sown at any time between late fall and May following. It is probably not a true spring wheat, but rather it occupies the border-land between these two sorts.

The millers give the Grass Wheat a good name, but thus far have failed to back their recommendations with any increase of price as compared with other spring sorts. This wheat has probably received its name from its grass-like habit of growth, in the young state. At this time and until it begins to "joint," the blades are of a pale-green hue, very numerous, long and glistening, and in general appearance the plant is quite like Perennial Rye-Grass during the first year's growth.

I shall look with much interest for the results of this year's experience with Grass Wheat, for, without doubt, it will either confirm us in an old practice or mark an important change in our agriculture.

We are passing through the most remarkable spring that I have ever yet experienced. On this 16th day of April I have finished all spring seeding, including corn planting. Last year I finished corn-planting, June 9th. Peaches are as large as the end of the thumb; white Rye is in full bloom; and I have just measured single stalks of Alfalfa sixteen inches in length. The weather is as warm as that of June ordinarily, and the season generally is fully a month-and-a-half in advance of the almanac.

State Ag'l College, Manhattan, Kas., April 16.

RURAL NEW YORKER.—By request of J. H. REALL, Esq., of your city, I forward you a copy of the United States milk record. If you wish to make editorial comments upon it you are at liberty to do so on condition of sending me a copy of your paper wherein it appears.

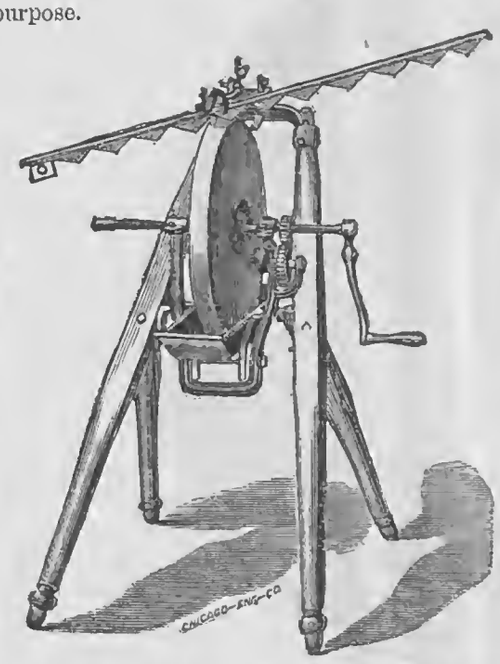
Respectfully yours, JOHN LORENTZEN.

The milk record above referred to is received. We do not wish to impose upon anybody's benevolence and so refrain from editorial comment.

Industrial Implements.

THE BOSS SICKLE GRINDER.

EVER since the introduction of mowers and reapers, the greatest difficulty to contend with has been to grind the sickles successfully, and every farmer who has ever owned or used one of these machines will quickly understand the value of a good and economical appliance for this purpose.



After many attempts and failures this end has been fully attained in the Boss Sickle Grinder, manufactured by POWELL, STEVENS & DOUGLAS, of Waukegan, Illinois, of which the accompanying cut is a good illustration. They first experimented with an emery stone, but it had two serious objections that could not be overcome, viz:—they could be used for no other purpose, and would take the temper out of the sickle. They next tried a V-shaped stone, but found it impossible to make it wear even, as the center would wear down faster than the sides; consequently, the sickles could not be ground true. All of these objections have been finally overcome in the Boss Sickle Grinder, which consists of a strong, durable frame, a flat-faced stone and a sickle-holder that will hold any kind of sickle made, and can be turned to one side out of the way whenever it is convenient to use the stone for other purposes.

This machine was first introduced to the public last season, and was widely distributed throughout the United States, but more particularly in the West, giving general satisfaction. It was exhibited at hundreds of Fairs, both State and county, and in no instance did it fail to receive the first awards. Benefiting by their first year's experience, the machine for this season has been greatly improved. It is now suitable for all of the purposes for which an ordinary grinder is used, aside from the sickle grinding attachment. It is simple and practical, and any one that can turn a grindstone can grind a sickle perfectly, and in less time than two men by the old method. A cam has been substituted for the thumb-screw in the holder, and can be moved from section to section about as quickly as though held by hand.

It will admit a stone 20 inches in diameter, and can be adjusted to wear it down to six inches. The machine is furnished with either Berea or Huron stone, of the best quality, 18 inches in diameter, and 2¼ to 2½ inches wide, averaging about 50 pounds in weight. In short it is a very practical, convenient little apparatus, well designed for the uses for which it is intended, and as it is well to prepare for the season before it is at hand, now is a good time to send to the makers for descriptive circular, etc.

AN IMPROVED SULKY.

So much has been said in these columns concerning sulky-plows, and we have expressed ourselves so clearly in stating their merits that more need not be advanced. There are some kinds of plowing that cannot be done as acceptably by any other implement, and on large places they should most certainly form part of the farm equipment.

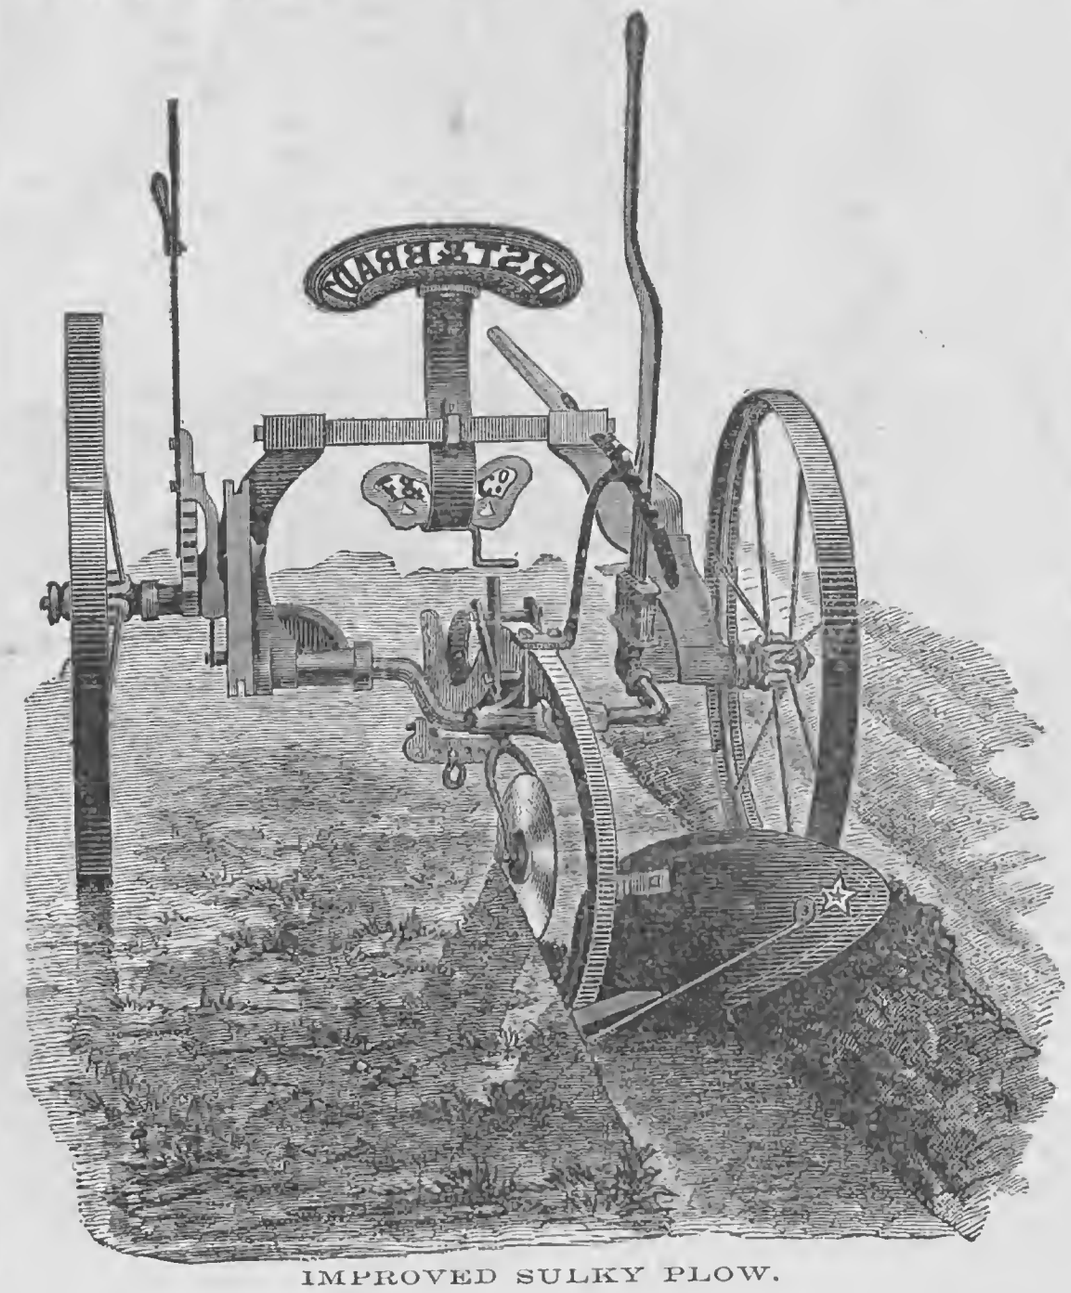
The illustration we print is a very fine and correct representation of the FURST & BRADLEY Mfg. Co's. improved sulky. It is made in Chicago, Ill. It is designed to combine strength and lightness, all superfluous material being discarded. Parts subject to strain or wear are however, fully strengthened. The wheels are exactly opposite each other and are readily maintained in that relative position. They run perfectly at different depths of plowing, so that in leveling up, or regulating depth of furrow, the direction of the plow remains unchanged, and side-draft is avoided.

The "compound leveling lever" throws the wheel up or down perpendicularly, and the depth is changed without stopping team or dismounting. The frame is independent of the main lever, allowing the plow to run at a uniform depth. This lever is also locked to the plow itself which prevents the pole being influenced by the movement of the plow. The pole is, therefore, steady, and does not press upon the animals' necks. Two or three horses abreast can be employed at the option of the operator. Stress is laid on the fact that when the lever is locked in the rack, the pivoting point is thrown forward from where the plow is attached to the crank axle, to the center of the wheel. This makes the plow run much more steadily, while the land wheel is passing over uneven surfaces, such as corn rows, or other elevations or depressions, as the up and down motion of the wheel is brought to bear upon the plow much nearer the end of the beam, and affects the running of the plow proportionately less. Still another feature of importance is, that in raising out of the ground, the point comes out first.

The mechanical construction of the sulky is admirable. Around the axles are sleeves which fit into the hubs of the wheels. These sleeves are stationary upon the axles, so that the hubs of the wheels turn upon them. As the hubs are cast upon a chill rendering them extremely hard, it follows that the wear must come upon the sleeves only, which, when worn out, can be instantly replaced at a nominal cost.

The handsome pamphlet issued by the makers gives much detailed information both respecting this sulky, and the numerous other admirable implements that are well and widely known in various sections. Sent free.

ZIMMERMAN'S PORTABLE DRYER and oven which appears in this issue is a sufficient answer to the many inquiries about dryers that have reached us recently. This one is economical, durable, portable and fire-proof. We have examined it and find it an admirable apparatus, well adapted to the purposes for which it is made. We advise our friends to send for circulars as a sufficient inquiry to all questions.



IMPROVED SULKY PLOW.

The Herdsman.

CALF FEEDING.

PROFESSOR E. W. STEWART.

A VERY important adjunct to dairying is the raising of calves, both for food and to replace the cows disposed of. Dairymen have not, however, given this legitimate branch of their business proper attention. It is very common, at meetings of dairymen, to hear them say they cannot afford to raise heifers for the dairy, and much less to raise calves for beef. I do not propose, at present, to take up the latter branch of the subject, but it has always seemed to me a strange conclusion that general dairymen could not afford to raise the cows to supply their own herds. The natural question to ask would be; "Can dairymen afford to allow anybody else to raise the cows to replenish their herds?" The treatment of the young animal has everything to do with the capacity of the matured cow for yielding milk. A cow cannot give a large quantity of milk without large digestive capacity, and a young animal, grown in a pinching and unthrifty way, has never had its digestive organs fully developed, and the digestive and assimilating capacity of such an animal can seldom be fully developed at a later period by the best feeding. This consideration, alone, is ample ground to show the profit of dairymen raising their own cows. But there are many other considerations, such as the attachment an animal forms to a place, and the unfavorable effect of change. The latter is often observed in feeding for beef animals that have been removed to strange quarters, and the effect is still worse upon cows in milk. I have often said that a good dairyman could better afford to raise his own cows than to have those raised for the market given to him.

RATION FOR THE YOUNG CALF.

Many dairy men are deterred from feeding calves because they think whole milk necessary to raise a good calf. Such persons have not studied the nature of food. It is true that milk, as it comes from the cow, is exactly adapted to the growth of the young calf, and that when any essential element of the milk has been separated from it, it has so far lost its perfect character of food. In butter-making the cream is taken from the milk, and the residue consists of casein, whey or milk-sugar and the mineral elements. But these remaining elements are the most valuable in milk. If, now, we can supply the oil which has been skimmed off, with something of less value than the cream, but having the same feed value to the calf, we are practicing true economy. The cream from the milk to supply a vigorous calf is worth 21 cents per day, at least, and sometimes 30 cents. Now this can be supplied for four cents in the oil from boiled flax-seed, and the flax-seed also contains a large proportion of albuminoids and the mineral constituents necessary to grow the muscles and bones of the calf. I have tested this so many times, and with such uniform success, that I can recommend boiled flax-seed as a full complement for the cream taken off.

A calf then may be fed skimmed milk when one week old, with the addition of one gill of boiled flax-seed, increasing this ration gradually to a pint per day when four weeks old, and then adding fine middlings or corn and oats ground together, or a pint to one quart of oats unground. Flax-seed gruel with plenty of skimmed milk will produce a very fine growth, leaving the calf as mellow to the touch as if sucking the cow. I have produced a growth of over three pounds per day, upon calves two months old upon this ration. The oil taken off in the cream can be replaced for one-fifth of the money value of the cream. Butter dairymen may raise a calf, to each cow, upon the skim milk and a little additional food, such as indicated, and get one-fourth to one-third as much profit out of the refuse milk as out of the butter. Selling butter robs the land of nothing valuable only carbon which has no manurial value.

Erie Co. N. Y.

Floricultural.

APRIL WILD FLOWERS.

THE wild flowers of April and May are far more delicate and graceful than the later summer blossoms. Those mentioned below may be found without difficulty in the New England woods and fields in April.

1. Dirca palustris. Leather-wood. Early in April the flower-seeker notices an irregular bush with angular branches, growing beside the mountain brooks. It has no leaves, but numerous yellow flowers grow on the branches in clusters of three or four, — the flowers are tubular and each tube has two contractions and a spreading border. The leaves appear some time after the flowers, and the shrub is called Leather-wood from the toughness of its branches which are composed of interlacing fibers, and is interesting from being almost the first that ventures to expose its blossoms to a New England spring.

2. Hepatica triloba. (Liver-leaf.) Almost before the snow leaves the woods the bright Hepaticas open their many-tinted blossoms of white, pale blue, French blue, very dark blue, purple, and in some localities they are of a very fine rose color. They are found in abundance around the roots of old forest trees and on sunny woodland hills, and are easily known by the three-lobed, evergreen leaves and straight, downy-flower-stems four or five inches high, each crowned with a pretty blossom. If transplanted to the garden these nice little plants bloom early in the spring and often become double by cultivation. They do well also in a Wardian case, blooming in mid-winter. The writer has had more than thirty blossoms from these roots during the last December and January.

3. Sanguinaria Canadensis. (Blood-root.) Very early comes the pretty Blood-root, snowy white in spite of the sanguinary name. They start up in multitudes beside the fences and along the borders of meadows and fields. In the early stage they look like tribes of green-wood fairies, each wrapped in a little green cloak made of a closely clasping leaf, which allows only the fair white bud to peep over the top. This plant also blooms early if set in the garden.

If the young botanist will follow the fortunes of one of these plants through the summer, he will find it interesting. After the blossoms depart, the leaves continue to grow, till by midsummer they are so large and so changed in shape as to appear like different plants. The root exudes a red juice, whence the name. The leaf and bud which are formed in the autumn for the next spring's bloom, are so nicely and definitely packed up, that with a magnifying glass they can be distinctly seen and even the stamens counted.

4. Anemone nemorosa. (Wind-flower). This vernal blossom is perfect in delicate grace. It is found abundantly in the woods and beside old fences and stone walls; the stem is six or eight inches high, with an involucre of pretty, tri-foliate leaves about half way up, and above these a solitary, drooping, bell-shaped flower of white shaded with purplish pink.

5. Thalictrum anemonoides. (Rue-Anemone.) A near relative of the preceding and choosing the same localities, differing from it in having an umbel of several flowers, sometimes called "Hen and chickens," the central flower, being larger, is the protecting hen, and the little chickens are the five or six smaller surrounding flowers. A charming little plant, sometimes found double, the petals white with often the most delicate pink tinge.

6. Epigæa repens. (Trailing Arbutus. May-flower). One of the loveliest and most fragrant wild flowers, growing in profusion in pine woods and most interesting to search for, yet the uninitiated may walk the woods all through the spring-time and yet be unable to find one. But let a person acquainted with its habits stoop down and scrape away the old dead leaves from under the tall pines and around the mossy rocks, and there are the hidden treasures with no stain from the surrounding rubbish on their perfect purity, and it is a rare delight to draw out the long, rough, rusty-looking stems upon which are clustered these waxen white-and-pink blossoms unequaled in delicacy and delicious fragrance.

To these few peculiarly pretty spring flowers others might be added, which in favorable seasons open in April, particularly the yellow violet and one or two species of blue violet, but as a general thing, many which are *said* to bloom in April, reserve their charms for the more assured sunshine of May. [The present season is an exception. ED.]

In the Middle States many flowers are found which do not appear in the colder climate of New England, among them the following which are in bloom in April.

1. Delphinium tricorne. (Dwarf Wild Larkspur.) Flowers bright blue,—sometimes white: found in open woods.

2. Zanthorhiza apiifolia. (Shrub yellow-root.) A low shrub, the stems and roots bitter; the flowers brownish purple in drooping racemes: found on the banks of streams.

3. Hydrastis Canadensis. (Yellow Puccoon.) A low herb with a single radical leaf and a flower-stem terminated by a solitary greenish-white flower: found in rich woods.

4. Asimina triloba. (North-American Papaw.) Shrubs with lurid, dull-purple flowers, and banana-shaped, yellowish fruit, ripening in autumn: grows in rich soil, beside streams.

5. Jeffersonia diphylla. (Twin-leaf) A singular plant with two-parted leaflets and large white flowers, called also Rheumatism-root: found in rich woods, growing ten or twelve inches high.

6. Erigenia bulbosa. (Harbinger of spring.) A small plant five or six inches high, blooming very early, often in March, with two or three divided leaves and an umbel of white flowers: found on shady banks: called sometimes "Pepper and Salt" from the contrast of the purplish-brown anthers with the white petals.

Many others might be named, which can be found on New Jersey hills, and in the woods of New York and Pennsylvania, and the *enterprising* seeker can easily find one new one every day.

EXCHANGE.

I WILL exchange Cactus for different kinds of Yucca or Spanish Dagger and Abronia for any bulbs or hardy perennial

River Bend, Colorado. M. V. SNYDER.

The Garden.

A KITCHEN-GARDEN.

MY IDEA OF A KITCHEN-GARDEN AND HOW TO MAKE IT.

I WOULD have the plot intended for a kitchen-garden slope to the southeast, clear of stones and stumps and surrounded by a picket fence, base-board 12 inches and pickets 5 feet long with 2 inch space between, 16 eight-foot panels square, making my ideal 128 feet square. I would place my gate on the west side 45 feet from the southwest corner. East of the gate, half way across, I would run a 3 foot walk with border on each side. From the terminus of this walk to east line, I would set twelve grape-vines, six on each side, with 8 feet between them, and train them for an arbor 12 feet high, the higher the better for fruit. I would set four Concord, four Delaware, two Martha and two Goethe (Rogers' No. 1). I would dig trenches, 2 feet wide and 3 feet deep and fill half full of small stones or brick-bats, broken crockery, pieces of earthen-ware and all the bits of glass and tin about the premises (a good place for such dangerous things) with a layer of old leather and small bones on top. Then a foot of the first should be thrown out and mixed with some well-rotted hen manure, tree leaves and sand, if the soil is destitute of it, and lastly the bottom earth of the trench should be put on top. Set the vines in the fall and cut back to three or four buds, and after these have started leave only the best one to grow. Train to a stake and pinch off top when 4 feet high; pinch out the suckers as fast as they appear, keep the ground mellow and free of weeds and grass and give each vine an occasional dose of soap-suds. Here I must leave the grapes.

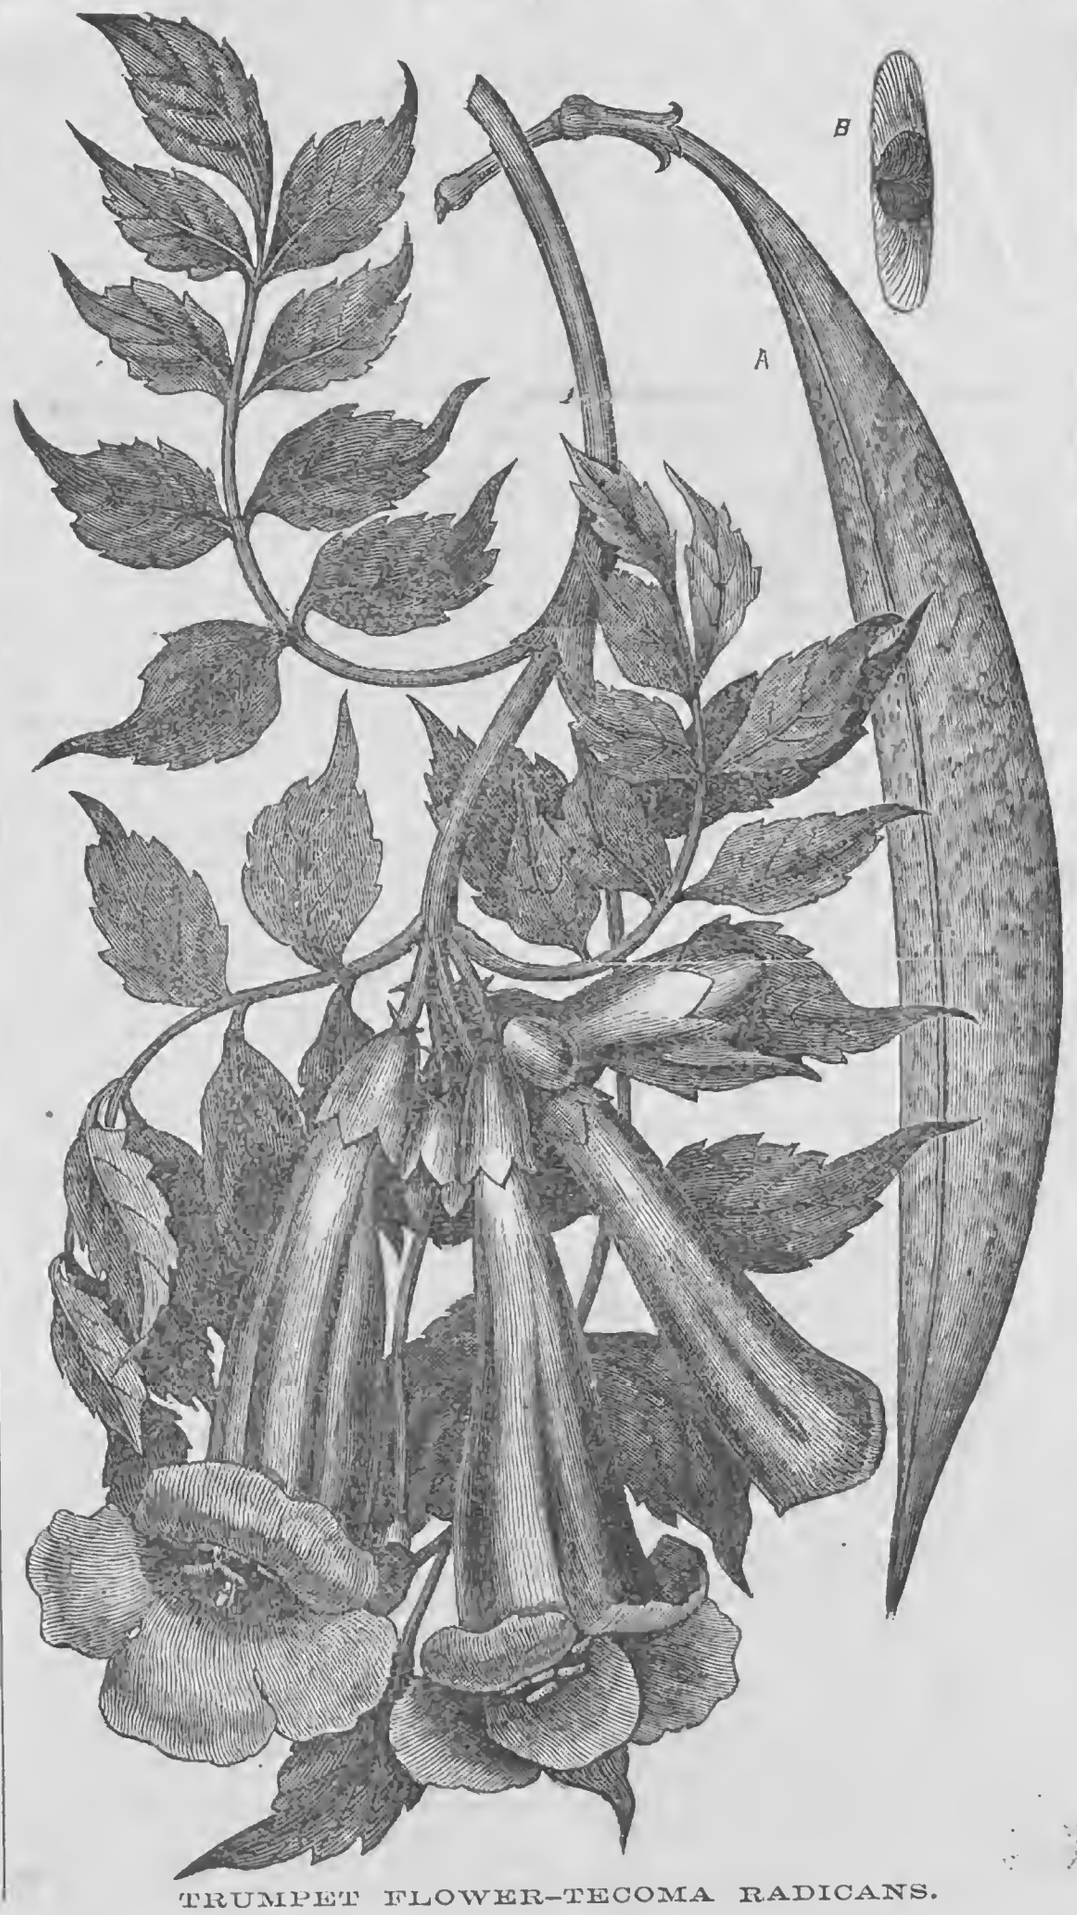
On entering the garden there must be a two-foot walk all around next the fence—the first things on the right and left are two standard Rose-bushes—now don't laugh for I want flowers in my kitchen-garden too—then down each side of the walk, on the borders, Verbenas, Pinks, Portulaca, Candytuft, Carnation, Mignonette, Pansies, dwarf Roses, etc., with a standard Rose on each side at the end. From here a like walk extends 45 feet either way, along the borders of which I will raise mint, parsley, sage, horseradish, pepper, thyme and all other aromatic and sweet herbs that are useful or ornamental. From the first Rose-bush to the southern line are ten currants, five each of red cherry and white grape; opposite these, extending north, are ten Houghton gooseberries. From currants to cross-walk are four beds, 2 feet between each; in the first are dwarf peas and onions; next, tomatoes; next, beets and parsnips; and last, bush beans (black wax), lettuce and radishes. Beyond the cross-walk we have: first, four rows of Jersey Wakefield cabbage, the rows running from the grapes to the southern line; next, five rows of Early Vermont potatoes—these are nearly as early as Alpha, and very prolific, of good quality, and keep better than the Alpha; then four rows Limas; next, twelve hills of watermelons which will finish up the south side.

Beginning at the north end of the cross-walk and running to gooseberries we will plant five rows of sugar corn, two of Early Minnesota and three of Stowell's Evergreen. Between this and the first walk I would set Strawberries, principally of the Wilson, Charles Downing and Kentucky varieties, and some of the new kinds for the purpose of testing them. Now for the northeast square: I would cut off ten feet from arbor to end of walk; one-half of this bed I would plant in cantaloupes and the other in celery, Sandringham and Boston market. Then eight ridges of sweet potatoes the length of this bed; then, four rows of peanuts; then, two rows Champion of England peas, and last a row of rhubarb (Linnæus). Now I have occupied 89x128 feet of my garden, leaving 39x128 along the north side, which I would plant in dwarf pears, cherries, quinces and Siberian crabs—set 12 feet apart each way and plant a few rows of raspberries and Kittatinny blackberries between.

Before laying off the garden, plow and subsoil to the depth of 20 inches, and work in thoroughly well-rotted barn-yard manure, ashes and lime and sand if needed. I would use a garden cultivator, spade, hoe and steel-toothed rake. Work often and, a couple of days after using the cultivator or hoe, go over with your rake and lift any weeds or grass that may have got trodden in the soil. Plant peas, onions, beets and parsnips as soon as the soil will work well; and beans, squashes and cucumbers as soon as danger of frost is over; plant squashes in the sugar corn rows and cucumbers between tomatoes; set some second early cabbage between the Wakefields and, when you "lay by" your sweet potatoes, make a hill in the center of four potato hills and set your winter cabbage. About the first of August, dig potatoes and hill up well your cabbage. When peas and beans are done bearing, save the ripe ones, clean away the vines and prepare for turnips by adding manure and working in well.

The last of July or first of August cover the ground with unleached ashes and dig it in with a rake; level off and sow seed, rake lightly and tramp in. A pair of No. 10 brogans under 170 lbs. of animated humanity, is the best contrivance I know of for this purpose. If the sun is hot, in 48 hours the little plants will begin to appear—don't soak the seed. When well up and when the dew is on, give a dusting of soot and air-slaked lime half and half, watch close and apply again if there are little holes cut in the leaves; after the rough leaves come on they will need no more dusting. Work cabbage when the dew is on, but work beans and other vines when dry only. If worms take your cabbage, use dry dust when the dew is on, or weak lime-water, or a little coarse shorts with a small quantity of salt mixed in. Plant dwarf peas allowing ten days between first and second planting, and do the same with cantaloupes. Plant tomatoes as soon as danger of frost is over, and as late as first of July and a planting between the two. The last planting will be ready for variety and sliced catsup. If any are left on the vines after this and there is danger of frost, pull up and hang them away in a sheltered position and they will continue to ripen. Keep the suckers well rubbed off and prevent the vines from falling over if you can. I use what I call a tomato crib which I think is better than stakes or poles. Pull onions as soon as the tops have dried up, and store in a cool, dry place. Cover the bed deeply with manure, spade this in as soon after Christmas as convenient, and so soon in spring as the ground is in working order put on a barrel or two of ashes and chop it in with a rake. The rows should be twenty inches apart and the plants three inches apart in the rows. Work often, but not too deep: hill up slightly until the stalks get ¾ of an inch in diameter, then work the soil from them gradually until ⅞ of the onion is exposed. Mulch fruit trees and berry canes and keep the ground mellow between. As soon as your vegetables have matured, remove them and manure and turn over the soil. This done in the fall, will save work in the spring. Change all vegetables from one bed to another annually except onions.

J. W. SWINDLER.



TRUMPET FLOWER—TECOMA RADICANS.

PEAS.—We remind our readers that McLean's Little Gem is conceded to be one of the very best varieties. For the latest we have already recommended British Queen as one of the best.

The Querist.

ANSWERS TO CORRESPONDENTS.

Plant Lice Etc.

D. H. Elliott, Suwannee Co., Fla., has sent us specimens of insects which prey upon all the plum trees in his orchard with a request to give their name. He also inquires what produces the dark-colored insects surrounding the stem and whether they are the cause of the decay and fall of the young fruit; what has the longer insect pinned to the accompanying plum to do with the damage; what attracts the flies, samples of which are sent along, and which gather so thickly as to sound like bees swarming. For several years the plum trees in his neighborhood have been injured by these pests.

ANS.—The dark-colored insects surrounding the stems are plant-lice (Aphis). What the particular species is cannot be said, both because too little attention has been paid yet in this country to the discrimination of the species, and because the specimens are in too dry and injured a condition. In their general characters, however, all aphides agree, inasmuch as they are produced throughout the warm season directly in an active condition from other aphides; that is to say, they come after the first spring generation, not from eggs but from buds; they puncture the tender parts of plants with their beaks and suck out the sap, thus weakening or destroying the plant; they exude a sweet liquid from special organs, and by the overflow of this liquid cause the leaves to become coated with a viscid, honey-like matter called honey-dew.

The longer insect had become detached from the plum, but among the debris shaking about in the box were found fragments of two or three forms of insects which feed upon the plant-lice.

One six-legged black insect, having the general appearance of an alligator, and dotted with red dots on the back, is the immature form of another which occurred in the box and may be generally known as a Lady-beetle; the latter is a rather flat, circular beetle, red with a black dot on each wing-cover above, and black beneath. The beetle lays its eggs in small-scattered patches on the leaves, and the young catches and sucks the blood out of the plant-lice. It is called a Coccinella.

A gray-striped, flesh-colored, legless maggot, slender in front, thick behind, and seeming to have had its hind end cut off squarely, was also found in the box. This maggot catches the plant-lice and sucks out their blood. It develops into a Gay-fly, more accurately called a Syrphus.

The flies are attracted by the sweetness of the honey-dew, which they drink. Ants are the particular visitors to herds of plant-lice, and treat the plant-lice with as much care as women give to the treatment of cows, milking them and sometimes carrying them from and to pasture.

Sumach.

M. F., Tioga Co., N. Y. inquires: 1, for what purpose the sumach of commerce is used; 2, who will buy the article that grows abundantly in this State, and what would be its value in the market.

ANS.—The sumach of commerce until lately consisted entirely of the imported leaves of Rhus coriaria of southern Europe and northern Africa, which greatly resembles in appearance our stag's-horn sumach, and like that forms a small tree. It is largely cultivated in Sicily whence most of that used in this country is imported. In growing it, suckers are planted in rows about four feet apart, and the shoots are yearly cut back to within a few inches of the ground, the crop for the following year being furnished by the new stems that push from the stumps. The shoots are dried and threshed; the leaves ground and bolted, and the powder put in sacks of 163 lbs. each, for shipment. The pure product contains from 30 to 35 per cent of tannin. This sumach is used for tanning light-colored leathers and in dyeing and calico printing. With different mordants it yields a great variety of tints. It is only since the civil war that any attention has been given to the American varieties, and only in Virginia where the headquarters of the industry are at Richmond. The smooth, the stag's-horn and the mountain sumach are collected indiscriminately and as these, especially the first, grow wild so abundantly, no cultivation has hitherto been attempted. The gathering begins early in July and continues until frost. The leafy tops of the plants are broken off and carefully dried; the best being that dried in the shade. When dry it is beaten with sticks and the leaves are taken to the mill to receive the same treatment to which Sicilian sumach is subjected. The American article contains from 15 to 20 per cent of tannin. Lately the luxuriance with which the more valuable varieties flourish in California has attracted considerable attention in some parts of that State, to the possibility of utilizing it there. There is no doubt but that in the rush and bustle of American life, many sources of wealth and profitable industry are for the time overlooked. Among the crowded population of Europe, content with moderate profits, these would long since have been brought into use, and will doubtless, ere long, be utilized here. The sumach that flourishes wild in many parts of the country will probably be then turned to profitable use, but at present inquiries in different parts of this city have failed to discover any market for the domestic product except for that from Virginia.

Miscellaneous.

Young Farmer, Chenango Co., N. Y. wants 1, a description of a cheap, serviceable and convenient farm gate, not liable to be unfastened by cattle and horses: 2, information about raising Pekin ducks; 3, the name of a reliable commission merchant in New York city.

ANS.—Cuts and descriptions of two kinds of gates that fill the above bill, can be found in the issues of the RURAL for the 18th of August and the 1st of September, last year; and a cut and description of an excellent gate-latch in the RURAL for March 23, this year. We cannot impress too strongly on our readers the advantages of preserving the back numbers of the RURAL, for in a file of old papers there will always be found a valuable fund of information on all topics connected with their business. Regard for the interests of the great body of our friends forbids us to repeat in these pages articles which have only lately appeared in them; and hence we have often, by letter and otherwise, to refer inquirers to back numbers. 2, An article on the Pekin duck appeared in RURAL for 19th of last January. They require no special care in raising, beyond that bestowed on the successful keeping of ordinary ducks. 3, For a commission house considered trustworthy, see answer to JNO. WELFARE, Jr. We must absolutely decline to recommend, in these columns, any special business house in this city or elsewhere, beyond stating plainly either the general reputation of the firm, or an opinion formed from our own dealings with it. In no case do we undertake any responsibility in the matter, except that of giving an honest opinion.

Jno. Welfare, Jr., Williamstown, Mich., asks us to state in Questions and Answers if WALTER, CARR & Co, Produce Commission Merchants, New York are trustworthy.

ANS.—This house is one of the largest in its line. We know nothing about their mode of treating customers, but their credit is considered above question. This answer will also serve for several others who have inquired for the name of a reliable commission house in this city.

An inquirer asks for the name and publisher of a work on capon raising.

ANS.—We know of no work specially devoted to this subject; but several poultry books treat of it in connection with ordinary poultry keeping, notably Dixon & Sear's "Ornamental and Domestic Poultry" published by Butler & Co., Philadelphia, Pa., and "The American Poulterer's Companion" published by Saxton and Miles, New York city. The former of these bears date 1855; the latter, 1845.

A Reader inquires: Will some expert state how he takes up and lays sod on a lawn, giving particulars; also the manner of laying a strip of sod along the edge of a path? Give some errors likely to be made by a beginner.

EMIGRATION TO NORTH CAROLINA.

PROFESSOR A. W. MANGUM.

IN view of the efforts being made to induce emigration from the North to the South—especially to this State—it is believed that plain and candid information and advice on the subject, from a disinterested party, will be duly appreciated. I am a native of the State, have resided in widely-separated portions, and traveled from the western boundary to the ocean. I was raised on a country-farm, have had immediate connection with agricultural interests, and have always kept myself in sympathetic relations with the industrial classes around me. I have no motive, but the best wishes for all concerned, to prompt what I shall write.

Without hesitancy I can indorse the statements which have been published as to the variety of the climate. The Blue Ridge mountains of the west descend, in diminishing undulations, into the hills of the center; and these gradually melt away into the broad plains of the east: all, together, constituting a remarkably varied territory, and offering what, in this respect, is an unusually favorable field for the gratification of diverse tastes. The summers are generally very warm, but the sea-coast and the mountains furnish delightful resorts. The winters, severe in the west, are, on the average, mild in the center and comparatively free from intense cold in much of the east; but they are marked by such sudden, frequent and great changes, at least in a large part of the State, as make them quite trying to feeble constitutions. This changeableness I consider the most unfavorable peculiarity of the climate.

As to healthfulness, that may be inferred, in part, from the indications of the climate. The west, like all mountainous districts, is very favorable to health. The air and water there are priceless boons. In much of the central portions, the air is quite pure and bracing, the water is generally cold and good, and no local causes of disease exist, except in narrowly limited communities. In the east there has long been a decided tendency to malarial diseases; but this has been to a considerable degree modified by draining the lands, putting many of the swamps in cultivation, and discovering, perhaps, better modes and means of medical treatment. The clay lands, down there, are healthier than the sandy lands. As a rule, very little attention is given to sanitary matters in the State; even the larger towns neglecting the most simple and inexpensive precautions.

Every intelligent emigrant would be glad to know about the relative productiveness of labor and the prospect of success in different occupations. I will speak first of farming. In this many who have come South have been grievously disappointed. The causes of their disappointment are easily explained. They came with notions and customs and methods adapted to an entirely different climate and soil, and they acted presumptuously on their mistaken judgment, to early and serious loss, if not financial ruin. They came to deal with a kind of labor that is altogether different from that employed on Northern farms; and from that they may have suffered much before they learned how to manage it most successfully—if, indeed, they ever learned. It must be remembered that we have long, hot, often dry summers. Hence there is need of deep plowing. But the plow must not run deep where the soil is shallow; and such is much of the soil in the State, particularly in the uplands; aye, even on many of the old bottoms. As an extreme illustration, take this case: A northern farmer came to the State and purchased a worn-out farm. He mistook the red clay (denuded of soil) for the soil itself, and affirmed that he would plow so deeply as to find the bottom of the soil. Result: His plows with the clay-stains far up the handles, were soon for sale at the door of the Court House. Of a colony from Pennsylvania, all but two comparatively failed. One of these was discouraged and decided to move to Missouri. The other rejected the advice of native farmers, to an extent, and regretted it afterwards. But he moved cautiously, worked faithfully, and is now decidedly succeeding. It is said that he was the only good manager—the only one who understood farming—of all the company.

In much of the State there is a clay subsoil that guarantees profitable results to wise methods of cultivation looking to the improvement of the land. Clover and the grasses grow finely. Pea-vines, rye, clover furnish ready means for increasing the fertility. Field hands get about $10 and board per month; from $14 to $15 when they board themselves. The division of the State lying between Raleigh and the Blue Ridge and the Virginia boundary and a line running due east and west from Charlotte, contains what is probably the most inviting portion for small farmers, or, indeed, for any farmers that have been accustomed to raise the common products of the North. In that division there are respectable facilities for transportation by railroad; though other lines are greatly needed. This division embraces some cotton territory and the lands that produce the finest tobacco; and the greater part is adapted to the several cereals. Mere laborers who cannot buy and stock a farm and live for a year on means that they bring with them, will not be apt to meet with success, if they come. Renters rarely become land-owners to a respectable or comfortable degree. Mortgaged farms, run on credit, do not pay for themselves. Laborers who hire for wages seldom rise to any better condition. Even when they can buy a few acres and erect a cabin, they seem to improve their fortune little if at all. Besides, labor is not in special demand. The people who have farms are generally without the means to employ much more labor than they have had. It is hazardous for a man to come with the expectations of making a support by working for wages. He does not know how to obtain employment readily, and our people have not yet learned to interest themselves in behalf of strangers so much as to help them to get remunerative places. The immigrants are left to shift for themselves. They generally receive attention according to the money they have, and not according to the money they need. They are quietly welcomed to the community, on fair and equal relations, and expected to take care of themselves. Plenty of people are ready to sell their land, and will if asked, give them such advice as they are capable of giving. So far as the Bureau of Immigration is concerned, it appears to be free from all pecuniary considerations, and will, no doubt, extend all practicable help to those who apply for information. I may follow this with other articles, bearing upon other kinds of occupation. If any of the readers of the RURAL wish candid statements on any subject connected with immigration into this State, I will gladly furnish what they desire, as far as I can, through the columns of the paper.

Chapel Hill, North Carolina.

FRUIT AND AGRICULTURAL NOTES FROM CALIFORNIA.

W. C. L. DREW.

OUR orchards at this season of the year never looked more promising; pear trees are masses of snowy bloom, while apple, plum and peach blooms completely cover the trees. Orchardists are somewhat behind-hand with their season work, owing to the many and too frequent showers. The last few days have been very pleasant and warm. All hands have made the most of it, and pruning and grafting, plowing and spading, have been the rule of the hour. With reasonably fair weather from this forward and a few good showers during May, our brightest hopes will, no doubt, be realized.

The planting of ornamental trees has been more extensive than in any former year. The Eucalyptus is being planted very extensively in all our towns and along the road-sides. Experience has demonstrated that it can be grown successfully in nearly all sections of our State, making in a few years fine specimen trees, thirty to fifty feet high. The Eucalyptus is propagated only from seed. There are many varieties, but only one—E. globulus, the true Blue Gum—is being extensively planted.

The seed is sown in cold-frames in March, transplanted into nursery rows in May, where they only require proper irrigation to make good trees from three to ten feet high. I find by experience that they do best transplanted in December or January. In removing them it is very necessary to keep the roots covered. Another popular ornamental tree is the Cypress. Of this we have several native varieties, C. McNabiana; C. macrocarpa or Monterey Cypress, and C. Goveniana. These are all evergreens and are the handsomest trees I am acquainted with. In some sections the Magnolia thrives remarkably well; and where it does grow there is nothing any prettier. The most popular tree we have for cemetery decoration is the Italian Cypress—C. pyramidalis. Lemons, Limes, Oranges and the new Japanese Persimmon will also occupy a place among ornamental trees in many sections, where it will not pay to grow them extensively.

In the small fruit departments, everything is rushing. Strawberries, all masses of bloom. In our section there is a greater interest being taken in small fruit, and another season bids fair to see many acres set out in strawberries, raspberries, currants, gooseberries and such. In the vegetable gardens all looks fine.

Feed is finer than it has been for many seasons and stock is doing well. As a dairy season this will be a remarkably prosperous one; stock is worth from two to three times what it could have been purchased for six months ago.

El Dorado Co., Cala.

RURAL SPECIAL REPORTS.

HUMBOLDT, Tenn., April 20, 1878.

OUR spring is about three or four weeks in advance this season, and up to this date, at least one-half the time too wet to plow, consequently crops of corn, cotton, &c., are not all planted yet. Warm growing weather. Wheat was thought to be unusually promising, also oats: a larger average sown than usual in Tennesco. The warm and wet weather now while heading, it is feared is damaging, as rust has already made its appearance. Clover and grass look fine: a fine prospect for fruit of all kinds. Strawberries ripening and we expect to ship largely from this section. Caterpillars are again abundant in orchards and unless destroyed, must do great damage to apple and plum orchards, not only destroying the crop of fruit, but in many instances the trees. We presume all danger of frost is now over, and we are safe on that score. Grapes and blackberries now blooming, I think much earlier than usual with us.

B. F. T.

WHITNEY'S POINT, Broome Co., N. Y., April 22.

WEATHER has been very mild during this month. Last night was the coldest night we have had. Thermometer, at sunrise, denoted 36°; at 8:15 o'clock, 66°. Vegetation very forward; cherry buds swelled to bursting; apple buds full; wheat looks nice. Eggs, 10c.; oats, 35c.; potatoes, 30c.

M. B. D.

WHAT THEY SAY OF IT.

EIGHTH WEEK.

The Rural Cricket to be Withdrawn, positively, the 1st of July.

The most Liberal and Valuable Present ever offered by any Journal.

ALL ARE PLEASED AND THE RURAL IS HAPPY!

ALL are delighted with the "Cricket" and the RURAL. J. B.
Tallahassee, Fla.

THE "Cricket" arrived safely, and I soon had it running. It is a perfect little gem, admired by every one who sees it. E. A. P.
Loudon Grove, Pa., April 23.

THE "Cricket" the merry little cricket, came to hand all right; it exceeded my expectation as a neat little time-piece. My sister, who is teaching, has it in school and says it is a perfect little gem to keep time. W. S. M
Lewistown, Pa., April 10, 1878.

THE "Cricket" was promptly received unharmed. We have it mounted on a bracket where it "ticks" merrily day and night, not seeming to get weary at all. We are very much pleased with it. Please accept thanks.
Rutland, Vt., April 19. J. P. S.

THE Cricket Clock arrived safely by express. I am very much pleased with it. It is nicer than I anticipated; I am free to say it is all you claim, and is well worth the money. It is a pretty little affair and ticks away as if it meant business. H. E. M.
Litchfield, Conn.

PLEASE pardon my dilatoriness in acknowledging the receipt of the "Crickot" which came duly to hand. It is a beautiful ornament for the bracket and a splendid time-keeper. The RURAL has my sincere thanks and best wishes for its prosperity. G. O. P.
Batavia, Ill., April 18th, 1878.

I HAVE received the "Cricket" (which is rightly named, as it rivals the cricket in noise,) and like it very much; now that I have it regulated it keeps right along with my eight-day clock, and although it is the sixth time-piece in the house I do not care to part with it. S. C. G.
Clinton, N. J., April 15th, 1878.

I RECEIVED the Cricket Clock the 19th of this month. It came all right; it keeps first-rate time so far and I should hate to part with it for considerably more than it and the RURAL both cost me. It is like the RURAL, "hard to beat." I shall never, willingly, stop taking the RURAL NEW-YORKER. H. F. S.
Shelburne, Vt., April 22.

THE "Cricket" Clock came to hand ten days ago with only one blemish upon its character, and that was nothing that ought to be spoken aloud, for many of us are in the same fault: that is being "too fast," but a regulator, you know, has a wonderful effect, sometimes, and it proved so in this case. It is just right now in every respect. Many thanks for this "thing of beauty," and I am sure it will be a joy as long as its life lasts. One cannot very well be lonesome in the room with it, it speaks so loud and clear, click, click, click. MRS. E. B.
North Cambridge, Vt., April 13.

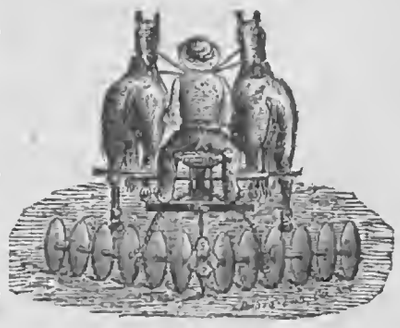
I received the "Cricket Clock" the 11th; the reason I haven't written you before is, I thought I had got sold on the clock. I wound it up, as I supposed, but it stopped two days in succession: after that I wound it clear up, and it hasn't stopped since. I feared breaking the spring if I wound it away up, so I concluded that was all there was the matter with it. I am very much obliged to you for so nice a gift: it keeps excellent time; am very much pleased with it. It reminds me of what the girls say when they got a new bonnet; "it is perfectly splendid." D. A.
New Labanon, April 22.

WE received the Cricket Clock in good condition. I at once wound it up, and it started right off on duty just as though it knew how, and I guess it did; for with a very little regulating it has proven itself to keep as correct time as the old clock, and by the way, makes much more noise. Please accept our thanks for such a beautiful and useful ornament for the dining-room shelf. The RURAL is a weekly visitor at our home and among seven papers it is our choice. Its valuable teachings and instructive lessons should be a sufficient compensation to all its readers for a little extra work to promote its best interests. J. D. R.
Bettsville, Ohio, April 22.

Implements and Machinery.

Established 1845.
—WOODEN PUMPS—
The Best is Always the Cheapest.
MADE FROM MICHIGAN WHITE PINE.
Wholesale and Retail.
—WOODEN WATER PIPE—
Always on hand and made to order.
Also, Chain Pump Tubing and the Rubber Bucket Pumps. Send for Circulars.
H. H. BABCOCK & SONS, Watertown, N. Y.

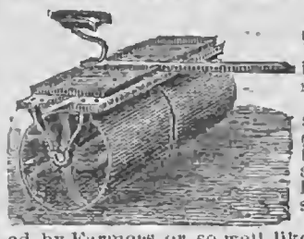
LA DOW'S JOINTED
Pulverizing and Smoothing HARROW.



Light, Simple, Cheap. Durable and Flexible.

Will pulverize and leave ground smoother and in better condition and cover seed better, by once going over, than twice with ordinary Harrow. Acknowledged the best in use. Being jointed in the center, it accommodates itself to uneven surfaces, such as dead furrows, ridges, &c. Made with both Chilled Metal and Cast-Steel Discs.
Responsible agents wanted where we have none. Manufactured by WHEELER & MELICK CO., Albany, N. Y., for the United States, except New England States. EVERETT & SMALL, BOSTON, Mass., Manufacturers for the New England States.

IRON FIELD ROLLERS.



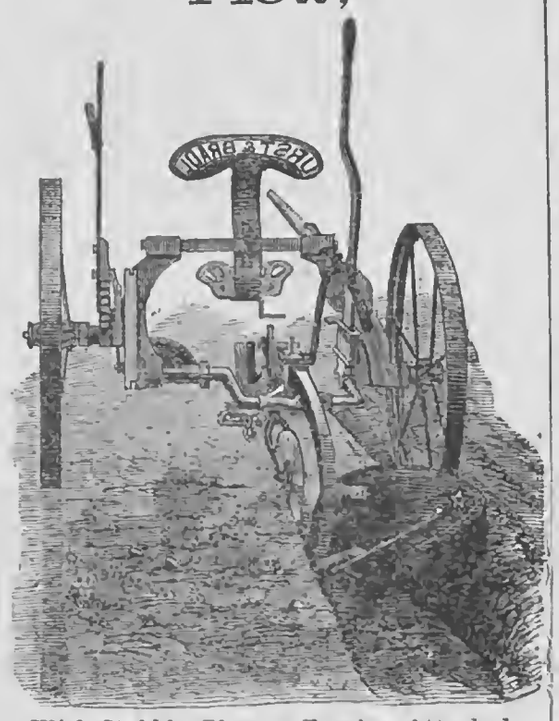
These implements are made of *Cast* and *Wrought Iron*, insuring the wearing of the same a life-time.
Efficient in preparing soil for proper and *sure germination of seeds* after sowing, by their action in pulverizing, leveling and rendering sufficiently firm.
No tool so much needed by Farmers or so well liked where known. For prices and further information, address
A. P. DICKEY, Racine, Wis.

CREAMERY BUTTER.

The Cooley System of Butter-Making has been before the public but one year, yet over 1,300 Dairies have introduced it. Read for yourself what people say about it who are using it:

OGDEN FARM, NEWPORT, R. I., March 24, 1878.
VERMONT FARM MACHINE CO.:
Gentlemen:—We are more and more pleased with the Cooley Creamer as we continue to use it, and we feel confident that we shall produce a better quality of butter this summer by means of it than we ever had before. We are now getting $1 a pound for our butter. Very truly yours, MELVILLE BULL.
Send 3c. stamp for Circular to
VT. FARM MACHINE CO., Bellows Falls, Vt.

ENTIRELY NEW.
Just Patented.
The Furst & Bradley
Iron Frame Sulky Plow,



With Stubble Plow or Breaker Attached,
As may be desired. It embodies
SEVERAL NEW FEATURES
CONTAINED IN
NO OTHER SULKY MADE,
And which are necessary for the PERFECT working of a Sulky Plow. If you wish to consult your BEST interests, be SURE, before buying, to send for our sixty-four page pamphlet (sent free), containing full description of FURST & BRADLEY
SULKY and GANG PLOWS, BREAKERS, WHEEL CULTIVATORS, SULKY RAKES, HARROWS, Etc.
Also, containing many valuable tables, recipes the latest postal laws, home physician, business laws, etc., etc.
FURST & BRADLEY MF'G CO.,
Office, 63 North Desplaines St.,
CHICAGO, ILLINOIS.

Implements and Machinery.

AHEAD OF ALL COMPETITION
1878.
THE PHILADELPHIA

LAWN MOWER.
SEVEN SIZES FOR HAND USE.
Weighing from 32 to 51 lbs.
THREE SIZES for HORSE POWER.
These Machines did an amount of work on the Centennial Grounds, equal to 10 years of ordinary use, without loss of time for sharpening or repairs—completely distancing all competitors in that celebrated trial of 6 months' duration.
GRAHAM, EMLEN & PASSMORE,
Patentees and Manuf'rs, 631 Market St., Phila., Pa.
Send for Descriptive Catalogue with prices.

FOUST'S

HAY LOADER.
A perfect machine for rapidly pitching hay, barley and all loose grain on the wagon in the field. Saves as much time and money as the mower and horse rake. Thousands in use by the best farmers in the country. Prices reduced. Send for Circulars to the manufacturers, STRATTON & CULLUM,
Meadville, Pa.

DOUBLE HARPOON
HORSE HAY-FORK.
BEST IN THE WORLD.
Descriptive Catalogue sent free.
Pennock Manufacturing Company,
KENNETT SQUARE, Chester Co., Pa.

CHAMPION
WINDMILL POWER,
(Underwood's Patent,)
Perfectly Self-Regulating.
For Pumping and Turning Light Machinery. All our Windmills are warranted, when properly put up, to stay and to do what we claim for them; also, manufacturers of the
ORIGINAL AND ONLY GENUINE
STAR PUMP
Porcelain Lined Iron Cylinder Pumps, Farm Pumps, Wood Eave Troughs, Tubing, Etc.
Illustrat'd Catalogue and Price List sent free.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MAY 4, 1878.

UNLESS something, which we cannot now foresee, happen to prevent, we shall present the new RURAL to our readers next week.

IMPROVEMENT OF VARIETIES.

THE ancients had very mixed ideas respecting the functions of the stamens and pistils in plant economy. Many vague notions were entertained and TOURNEFORT, late in the seventeenth century, rejecting the idea of fertilization, considered the stamens merely as excretory organs. We believe that SEBASTIAN VALLIANT, who was a disciple of TOURNEFORT, was the first to point out the phenomena of fertilization, explain the office of the stamens, and thus to open up a field for future investigations of which the present age is making a practical use the value of which we ourselves but imperfectly estimate. France may therefore claim a discovery which, if not among the most important discoveries of man, is at least the most important that has ever been made in the science of botany. A few years later, LINNÆUS by writings distinguished for accuracy and patient rearech, popularized the facts of VALLIANT.

That we can improve the quality of our crops by selecting the best seeds, is well known. Being well known, it is a wonder that farmers and indeed horticulturists as a rule, avail themselves of the benefits of careful selection to such a limited extent. But they can do more than this. The same as the best traits of different breeds of animals may be combined in their offspring, so desirable characteristics which reside in different varieties of plants, may be combined so as to produce in new varieties an improvement upon either parent or, it may be, a combination of their best qualities.

The word *hybrid* has been abused by horticulturists all over the world of late years. Hundreds of plants of no especial merits over others of the same species, have been lauded as "hybrids" of surpassing excellence. But among the mass of rubbish a considerable number which are improvements upon any of their kind hitherto known, have been introduced and to these we point as evidences of what may be accomplished by patient and persevering efforts in the way of discriminating crossing.

Many plants possess sexual organs which do not mature at the same time. Hence each pistil is therefore dependent upon the pollen from some other individual for an effectual pollenation. But here there is no selection, since it is as likely to come from an inferior as from a superior plant. It is the same with diclinous plants or those which have the sexes in different flowers, whether upon the same individual or not.

Many plants are self-fertile from the seeds of which through successive generations no improvement, from seminal causes at least, need be anticipated.

But he who is interested in producing new and superior varieties of plants, whether of grain, potatoes, fruits or what are generally known as ornamental plants, may select his own parents and bring about a union of blood which he believes may eventuate in combining those qualities which in the highest degree may be rendered subservient to his needs.

"If at first you don't succeed
Try, try again."

The farmer, we fear, will not feel that he is interested in the above remarks, and yet it is he whom we would specially interest. Let him not cast it aside as the vagaries of science, but begin the present season a series of experiments to test its value in practice. If, for instance, he would add to the sweetness and richness of the Black Sweet Corn, to which we referred last week, the size of the Evergreen, let him select a few kernels of each from the best ears and plant them, side by side, away from any other variety.

As soon as the tassels (which are panicles of male flowers) develop or, at any rate, before the pollen ripens, cut all of them off from either the one or the other variety. The silk, which is the thread-like pistils or females of the plants which have had the tassels removed, will then receive pollen only from the other variety and a cross between the two must result.

This is as simple a method of crossing as we can think of. In crossing other plants, such as potatoes, beans, grapes or currants—each flower of which has both pistils and stamens—the principle is the same. In order to prevent self-fertilization, the stamens must be removed before the pollen is shed, and then pollen must be applied by the aid of a brush or point of a knife, to the pistils. If fruit and seeds form, we know a union of the two has been effected. It is true insects—perhaps wind—may interfere. A gauze covering will insure against this.

THE EUROPEAN EMBROGLIO.

EACH day's telegrams from the other side of the Atlantic, although usually contradictory in matters of detail, are constantly becoming more bellicose in their general indications. Since the close of the late war, early in March, diplomacy has had ample time to effect some arrangement which would at least hold out a promise of a peaceable solution to the present complications. But despite the high character of the diplomatic chiefs who now direct European politics, despite the abundant facilities for rapid interchange of views afforded by the ubiquitous telegraph, despite the reiterated anxiety of all parties for a pacific issue to the existing entanglement, diplomacy has hitherto signally failed, not only to bring about an adjustment of discordant interests, but even to check the accelerating drift of the antagonistic elements towards a belligerent settlement of the questions in dispute. The meeting of the Congress from which so much has been hoped, which has so often been regarded as almost a certainty, is now more improbable than in the week in which the signatures of Russia and Turkey were put to the treaty of San Stefano. Even in the improbable event that Bismarck's influence should bring the assemblage together, the chances are even that its deliberations would merely defer not prevent hostilities.

Neither Russia nor England makes any secret of its determination that in case of an adverse decision on certain points which each considers essential to its present interests and future prosperity, it would refuse to be bound by the action of the body, and seek a more favorable verdict by force of arms. That some of these hitherto undivulged points on which each is resolute to assert its own views, should not be identical in both cases, is hardly possible, and in the probable event of both Powers insisting on an auspicious decision on the same condition, it would be impossible to satisfy both, and the disappointed malcontent would be very likely to nullify all the labors of the assemblage.

From present indications the preservation of peace depends: first, on the meeting of the Congress, which is unlikely to take place; secondly, on its accomplishing a well-nigh impossible task—to reconcile irreconcilable differences, or, at least, to compromise the resolute claims of two powers, both haughty, arrogant, and jealous, and each confident in the justice of its pretensions, and its ability to vindicate them by war. Viewing the European predicament from all sides, the conclusion is, therefore, inevitable that while peace is still possible, war is far more probable.

WHO IS IN FAULT?

The editor of the Germantown Telegraph notices that a certain nurseryman on the Hudson (shall we put it nurseryman-on-the-Hudson?) has gained access to the columns of a large number of newspapers, agricultural and religious periodicals, to proclaim the superiority of certain raspberries. His name and residence are given in full so that those tempted to purchase may know whom to address. By such means "this enterprising man must have obtained a thousand dollars worth of advertising." "We are amazed" says the Germantown Telegraph "that our contemporaries should be so easily hoodwinked by a sharper." We are glad that attention is thus called to this method of advertising, which is now-a-days far from uncommon. The objection seems to us to be that the reader becomes interested in special articles not knowing that the writer is advertising his own goods, for which reason he naturally places more trust in the writer's statements than he otherwise would. For several seasons past we have received "timely" articles from a nurseryman-on-the-Hudson, which last fall and this spring we declined to publish. The same articles appeared shortly afterwards in quite a large number of other papers, the editors of which we have little doubt knew full well the writer's motive. It is our impression that this person and he to whom the editor of the Germantown Telegraph refers are the same. He may be a "sharper." We do not know. The articles in question were written well enough and, so far as we know, were trustworthy. But we do not believe the editors who published these articles were hoodwinked in the least.

NOTES.

Stock Raising.—Experienced farmers agree that stock-raising, in its various departments, ought to be made a leading and in fact the most prominent feature of farm operations in Kansas. Corn is entitled to be crowned king of farm products. Its valuation for 1876 is estimated at $19,217,332.24, according to the Fifth Agricultural report of that State, or 42 per cent. of the aggregate valuation of all crops. Add to this the enhancement in value of that portion of the crop which is consumed by $32,489,293.00 worth of live stock, together with the invaluable factor this great staple is in maintaining the fertility of the soil by virtue of its flesh-producing qualities, thereby being fed to stock more than all the other cereals combined, and its claims to supremacy cannot be controverted.

Food For Canary Birds.—People who keep canary birds may grow nearly all the seed the birds require by sowing a small patch of Millet. The birds will do well on this with a little hemp and poppy seed for a change. The latter with the Millet are imported and are expensive, costing from ten to fifteen cents a pound retail. The aggregate consumption in this country amounts to many tons in a year.

BREVITIES.

THIS is a grand season for Tulips.

A CURE for sleepiness: Caross Laportea Canadensis.

IF a horticulturist is not zealous, he is not worth a cent.

"NOT only choose a proper mate, but proper time to marry."

IT is always wise to relinquish outposts that have become untenable.

"HARD crabs from Norfolk are packed in grass without ice." Crab grass?

WHEN you begin to suspect you are getting the worst of it, use oracular and grandiloquent phrases.

THERE are now 85,880 office holders. How can it be expected that such a gripe as this should ever let go.

THIS is about the season to advertise plans and specifications for chicken coops. The edible spring chicken will soon be around in paying numbers.

A WEED is a plant the supply of which is greater than the demand, that, while its merits are not appreciated, knows how to take care of itself in the struggle for existence.

CAMDEN Co., S. C., has produced $200,000 worth of turpentine this year. S-tar-tling intelligence. We can now comprehend the resin of the State's now prosperity.

IN the RURAL of April 20, an article upon the Apple-Tree Borer appeared in its appropriate place without signature. It was from the pen of WM. H. OLIN.

MR. J. J. THOMAS says: And what more enduring memorial of valuable service to posterity can we render than to trasmit a fine fruit which shall survive when we have passed from our labors on earth?

SPEAKING of the retirement of Mr. J. B. LAWES from participation in the Woburn experiments, the London Farmer says: "No person in the world is more competent to conduct practical experiments in scientific agriculture than the *savant* of Rothamsted.

MR. HEMSLEY mentions in his interesting and instructive series of botanical articles published in the London Garden, that he once traced the roots of Sanfoin to a depth of seven or eight feet and that their average depth in the field was five feet. He has also traced the roots of wheat to a depth of seven feet. There are records of it reaching a much greater depth.

OUR contributor, MR. E. PICKMAN MANN writes us: "I doubt the efficacy of washes for fruit trees unless the substance applied is of such a disagreeable nature as to repel the parent beetles and is kept on the tree. Rubbing with a bar of hard soap so as to fill crevices and leave a solid basis for new solutions whenever the rain falls, is better than any application of solutions ready made."

A LITTLE learning is a dangerous thing. There are other dangers of this sort that Lord BACON might have added. For instance, a little of truth and a good deal of deceit—an ingenious mixture which in these funny days is infused rather freely into the veins of the great mercantile animal. The secret lies in telling frankly a homely truth or so which does not cost too much and then, while the breath of candor is still upon the lips, uttering the falsehoods from which the gain is to be derived.

M. REVEL, the author of a prize essay on the milking of cows, states that owing to an unfortunate spirit of rivalry common among young milkers, they often make it a point of honor to try and get their pails filled in the quickest time possible; consequently they only draw from each cow as much of her milk as is given down rapidly and readily, and leave a considerable quantity behind; or, again, in the case of an easy-milking cow, they will drain her to the last drop, and leave nothing for the calf. In this way they may fill their pails rapidly, but the interests of the owner suffer for it ultimately; and he will do well to assure himself from time to time by personal trial that one cow is not left for another till she is fairly milked out.

ANTHRAX in cattle, according to the Report just published by the Royal Prussian Committee on Veterinary Affairs, has greatly diminished in that country in districts where drainage has been introduced. It also states that the disease is often caused by a contagium of very persistent vitality present in the soil, and that the existence of this contagium is to be ascribed to the insufficient burial of animals that have fallen victims to the disease. It is much to be wished that we had in this country, at least, if not in each State, a society whose duty it should be to collect and periodically publish for the benefit of the community at large, facts gathered from experience in every branch of knowledge of use to the agricultural and all other interests.

THE past week, ending Monday April 30th, has been one of clouds and rain though not too much of the latter. As we look over notes of past years and look upon vegetation, it is not easy to realize the earliness of the season. The air and the ground are warm, and grass, leaves and flowers are growing and developing so fast that the change is perceptible from morning to night. April 13, 1875, we had snow all day. On the 14 the trees were heavily laden with snow. Protection was not removed from beds or trees. On the 25th, we had an inch fall of snow. On the 5th of May we had a sharp frost, ice forming in places. Grape vines were not quite so far advanced in leaf on May the 15 of 1875, as they are now. May 15 of that year was the first bloom of cherry trees. This year cherry trees bloomed the 19th (April.) From other comparisons, we think the present spring is nearly three weeks earlier than the average spring of this section of the country.

Literary Miscellany.

THE SWEETER MUSIC.

A BROOKLET, playful flowing
Adown the rocky steep
Where ferns are greenest growing
And forest shades are deep,
Makes music, wild and sweet,
Among the trees' rough feet.

The forest warblers, singing
With many a happy trill,
Their gay notes outward flinging
As careless as the rill,
Through all the summer heat
Make music, gay and sweet.

Yet, not the brooklet, going
Its winding, wandering way;
Nor breath of breezes, blowing
Amid the leaves at play;
Nor birds on pinions fleet,
Produce the tones most sweet.

A baby's laughter ringing,
A sound of pattering feet,
The lips of childhood singing,
Makes music far more sweet
Than brook, or breeze, or bird
That mortal ever heard.

[*Boston Tran script.*

CORA.

CHAPTER XIII.

LIKE a skillful surgeon, Marianna had cut deeply; for though Cora suffered acutely, she came out of the suffering cured. She was too proud, too true to herself, to love anybody she could not esteem and trust; and by the death-blow to her esteem her love was killed. It was not momentarily extinguished, ready to rise again from the cinders at a moment's notice, but utterly dead; and in her heart there was no feeling towards him but scorn unutterable. She would not marry him now, she told herself with truth, were he to sue her on his knees; and whenever she recalled the honeyed words and gestures she had so delighted to dwell upon, it was with a shudder of disgust.

But still she suffered, suffered keenly, and the suffering changed her from a girl to a woman; colder and prouder, perhaps, than in the old, happy days—less impulsive—less easy to impress, but infinitely more worthy of love, infinitely more precious to win, than the Cora of old. More beautiful, too, in her quiet repose; and, though gentle and easily led by a word from one she loved, more reserved and distant to all others.

And so two calm, quiet years passed away, and Sir Alan was still abroad, though Lady Vincent yearned to see her son, and Cora grieved that it was on her account he remained away. If she had thought much of him after her return to England, when her heart was full of Lord Almane, she thought more of him now. On every side she heard him spoken of in the highest terms, and she recalled often and often the tender consideration which had marked his conduct to her at Rome. She thought of his kindness, his womanly tenderness, towards her sick brother: she remembered how, even after her own, Harold had sought his face with a last gleam of recognition and love; she recollected many a proof of his unselfishness, his unfailing goodness towards herself; and then, with a thrill of joy and pain, there would come back to her that last interview, when he told her how much he loved her, and had prayed for her love in return. She felt now, as then, unworthy of that love; and yet, were it offered now, Cora knew that her answer would be a very different one, and that the honor, the reverence she entertained for Alan Vincent would want but little to change them into love.

Christmas was drawing near—the second Christmas since Cora had come to The Bungalow; and one morning Lady Vincent came down to breakfast, her face radiant.

"What good news have you written on your face?" said Cora, coming in from a walk round the lawn, with bright eyes and glowing cheeks.

Lady Vincent kissed her and laughed.

"You shall guess," she answered. "Nay," said Cora, smiling, "unless it be about Sir Alan, I cannot guess."

"But it is about Alan," replied her ladyship, gaily.

Cora hesitated a moment; the glowing crimson faded a little when she spoke again.

"Is he going to give you a daughter?" she asked, smilingly.

"Perhaps—yes, I hope so," said Lady Vincent. "At any rate, he will be able to receive our congratulations in person, for he is coming home."

"Coming home! I am very glad dear Lady Vincent. How happy his return will make you!"

And Cora busied herself with the tea-urn, and said no more.

The news spread like wildfire through the household, and each one partook of Lady Vincent's satisfaction. Charles, the old soldier who had served under General Vincent, and left the army with him, living with his old general as butler, valet, and friend combined, was frantic with delight.

"Now we must keep Christmas Cora," said Lady Vincent. "It must not be dull for Alan, and I will do something to celebrate his return. What shall it be? An old-fashioned Christmas party: invite the little people first, and let them enjoy themselves, and let the grown-up children dance afterwards. Cora, what a prosy child you are! Cannot you imagine that you have a grown-up son coming home after a long absence?"

Three days after his letter came Sir Alan himself, and his delight at seeing his mother again was contagious.

"How well you are looking, mother darling!" he said, holding her at arm's length to gaze upon the still beautiful face. "Who has taken such care of you? I don't think you have missed me in the least."

"A daughter will not replace a son, Alan," she said smiling; "I want both my children with me. Why, where is Cora? She was here a few minutes ago."

But Cora had stolen softly away to let the mother and son have their first meeting alone; and it was only when Lady Vincent sent for her that she came down.

Sir Alan rose, and went forword to meet her with perfect cordiality, but with no trace of embarrassment; and his manner put Cora at her ease. On that first day he adopted towards her the tone he always afterwards used—perfectly familiar and friendly, kind and thoughtful, but with no trace of any deeper feeling.

Try as she would, Cora could not but feel disappointed. She had told herself again and again that he could no longer care for her, and yet his tone of indifference, kind though it was, pained her greatly.

One afternoon Cora had walked across the common to carry one of Lady Vincent's presents to some of her poor people. She was accompanied by a pretty young country girl, who was living at the Bungalow as under-housemaid. Although they had hastened to finish their business, it was dusk when they turned homewards, and it was almost dark when they reached half-way across the common. Neither felt nervous, however. The maid had been used to lonely country places, and Cora was naturally brave; still, both started a little, and quickened their pace, as they heard rather unsteady footsteps beside them, and a thick, husky voice said:

"It is rather a late hour for two pretty girls to be out alone."

They made no reply, but hastened on.

"Wouldn't you like an escort?" continued the man—a huge, hulking fellow, who had evidently paid more than one visit to the alehouses upon his way. "Only too happy to be of use to you ladies."

So saying, he put his hand on the housemaid's arm, and stooped to look into the girl's face. She attempted to disengage herself, but in vain.

"Pray allow us to proceed," said Cora, haughtily. "We are anxious to return home."

"Are you indeed?" he answered, with a coarse laugh; and Cora's courage almost failed her at the insolence of his tone.

"Let us run, Jane," she whispered; and they set off swiftly."

"Two can play at that game," laughed their tormenter, quickening his steps also.

Cora glanced back in despair. There was not a house in sight, and their only chance of assistance consisted in meeting any passer-by.

The man was gaining on them rapidly. Cora could hear his footsteps close beside her. She turned despairingly.

"How dare you molest us?" she said, trying to steady her voice. "You shall be punished if you do not desist."

"Punished!" he said, laughing, "Give me a kiss, my pretty one—that will be my only punishment to-night!"

"Will it?" said a low, stern voice, and the man felt himself seized by the collar, lifted off his feet, and thrown into a heap of furze and brambles in the bottom of a dry ditch which skirted the common.

CHAPTER XIX.

IT had been the work of a moment, and Cora hardly discovered that assistance had arrived when she heard Sir Alan's voice speaking in low, deep tones of indignation.

"Lie there, you scoundrel!" he said. "I cannot wait to give you your deserts now; but I owe you a hiding, and if we meet again you shall have it with interest."

"I'll pay you out, my fine swell," shouted the other, foaming with rage. "It's your turn now; but mine will come, and then we'll see."

Sir Alan laughed as he turned from him, and came back to the two girls.

"I am afraid you have been annoyed, Cora," he said, quietly. "It was fortunate my mother sent me to meet you. You must not take these long walks unattended for the future. Charles should accompany you, or I am at your service whenever you like."

How the quiet, cold tone jarred on Cora's excited nerves as they walked on. She was pale and trembling, and already wearied by her long walk, had some difficulty in keeping up with Sir Alan's hasty strides.

When they came into the lighter village streets, he perceived her agitation.

"Have I been walking too fast for you?" he asked, in the same quiet tone. "I have been unused of late to walking with ladies. Will you take my arm?"

Cora thanked him coldly, and declined.

Sir Alan glanced down at her in some surprise.

"You had better, I think," he said. "You must be very tired."

She shook her head impatiently, tears of anger and mortification at his cool manner rising in her eyes; and when they arrived at The Bungalow, she ran up stairs angry with him, with herself, and very thoroughly unhappy.

When Lady Vincent came into the drawing-room ready for dinner, she found her son already there, standing in the attitude dear to an Englishman's heart, with his back to the fire, looking handsome, and distinguished, but rather gloomy.

"What is the matter with Cora?" said Lady Vincent, as she sat down, and arranged her soft gray silk skirts to her satisfaction. "I just looked in upon her *en passant*, and she had evidently been crying."

"I suppose with annoyance at having to walk home with me," he answered, gloomily, as he told her the circumstance which had occurred that evening, concluding: "I believe the child hates me, mother. You wrote me that she seemed quite happy."

"So she did until you came," said her ladyship, quietly.

"Then let me go back," he said, impatiently. "Mother, don't be angry; but I was happier at Rome, and if I make the child unhappy——

"She is no longer a child, Alan," said his mother, half smiling.

"Child or woman, I think she hates me!"

And Sir Alan gnawed his heavy moustache, and stood looking fiercely down at the hearth-rug the picture of bearded annoyance.

"Well, that is a good sign," said Lady Vincent, smiling outright at Sir Alan's perturbation—"a very good sign."

"Don't, mother mine," he replied, imploringly. "I cannot joke about it."

Lady Vincent rose, and put her hand on his arm.

"My dear Alan, I am not joking. Nothing is so good as a good hatred—except love itself, of course."

"Did you ever hate my father, mother?" he answered, smiling sadly. He was too deeply in earnest to jest about his affection for Cora.

"Never hated him, Alan," she said, gently; "but I may have pretended to do so."

The last words were spoken *avec intention*, as the French have it; and Sir Alan started a little at the meaning she applied.

"Will you not trust to an old woman's wisdom?" she asked. "I think Cora's feeling towards you is anything but hatred. Will you give me leave to find out, Alan? I will not compromise your dignity in the least."

"Nor pain her mother?" he said, doubtfully.

"You may trust me, Alan," she answered, gently.

At this moment Cora entered. She was dressed very simply in black silk, with silver ornaments, and a silver comb fastening back her dark hair.

Sir Alan's face colored as he saw her; it would have been almost impossible for clouds to remain upon it with such a sweet vision in sight. Lady Vincent turned to her as she entered.

"Cora," she said, gaily, "we want your congratulations. Alan is going to give me a daughter."

Sir Alan started, but his mother's rapid glance told him that her words were but the beginning of the "finding out" she had spoken of. Watching Cora, he noticed that her face did not change; Lady Vincent, more observant, saw how the girl for a moment clasped her hands together as if in sudden pain.

"Congratulate me, little girl," she said, gaily, again taking Cora's hand in hers, and looking down smilingly into the dark eyes which met hers with a hunted look of pain. "Yes, I do," said Cora, a little confusedly. "Very sincerely."

Then, turning to Sir Alan with a sudden impulse, she held out her hand. "With all my heart, Sir Alan, I wish you every happiness."

Sir Alan was a bad dissembler, but he managed to say a few smiling words of thanks; and to Cora's great relief Charles announced dinner, and so put an end to any present conversation.

For the next two or three days Lady Vincent narrowly watched her young guest. Cora seemed restless and ill at ease, busied herself with almost feverish energy with the preparations for the coming party and seemed to avoid any time, for rest or relaxation. All these evidences of a restless state of mind were not unpleasant symptoms to Lady Vincent; on the contrary, she seemed well pleased; and Sir Alan, who was too unhappy him-

A MAY DAY SCENE.

MAY comes again, bright, sunny May!
To light the earth with purer ray,
To chase the mists that linger still
Adown the stream, or on the hill.
The woods with happy voices ring,
The fragrant breath of bursting spring
Pours gladness through the morning air,
And fields are green, and skies are fair.
Away cold winter, and dark night!
The world awakes to life and light.

self to be observant or really to enter into his mother's conspiracy, could not understand her satisfaction. He remembered too clearly, and with too sharp a pang, even now, Cora's passionate "It cannot be; not now, not ever," to have hope; and yet rarely were truer words spoken than "woman often changes."

He loved Cora now with a much deeper, more steadfast love even than the affection he had once offered her, and if she could not love him, no other woman should be his wife. He loved her, too, with a love characteristic of his ardent and jealous temperament; he almost hated any man to whom she spoke civilly; and this "green-eyed monster," which certainly was the young baronet's beselting sin, led him to be morose and abrupt in his manner. He knew it himself; but he excused himself with the thought that it was the uncertainty only of his position; that if he could be sure of her love being his, it would torment him no longer.

It was the morning of the day fixed for Lady Vincent's "old-fashioned Christmas party," and, the final preparations being made, Lady Vincent was resting from her labors in her own sitting-room, the only room the decorators and upholsterers had left intact in their operations.

Sir Alan had taken refuge there also, and was sitting in a cushioned recess, deep in a volume on sculpture, which was making a noise in the art world, and partially hidden from view by a heavy curtain which fell over the recess, and effectually shut it off if need be from the room.

The mother and son had been sitting in silence for some minutes, when the door opened quietly, and Cora came in.

"You look tired, my dear," said Lady Vincent. "You must have a rest before to-night."

"I am not tired," she answered, slowly. "Lady Vincent, can I speak to you for a moment, as you are alone?"

"Of course, my child," and Lady Vincent sent a rapid, entreating glance to Sir Alan not to disclose his presence, of which Cora was evidently unaware.

The young girl drew a stool to Lady Vincent's side, and taking her hand in hers, caressed it in silence for a moment, then, still with her face bent and hidden from view, she said:

"Lady Vincent, you will not think me ungrateful for your kindness, if I leave you?"

"Leave me!" said Lady Vincent, in a tone of some surprise, which was admirably feigned, for she expected something of the kind. "You can only leave me on one condition, Cora."

The girl lifted her eyes in questioning surprise.

"Only for a happy home of your own, dear," said her ladyship, smiling. "On that condition only will I consent to give you up."

The color flashed up for a moment in the fair face; but fading, left her white as death. She shook her head.

"Listen, dear Lady Vincent," she said, very quietly, with a strange, forced calmness. "When you consider, you will not keep to that resolution. I have been very happy here, and no mother could have been kinder to me than you have been. Ah! believe me, I can never forget it; but you will soon have another daughter—a real daughter—to love, and——" she hesitated, evidently speaking with difficulty—"you will not need me then."

"My experience of one daughter only makes me wish for another," answered Lady Vincent smiling. "What nonsense you are talking, Cora. The Bungalow is big enough for you and for Alan's wife,"—she felt the little fingers tremble as she clasped them—"when she comes." "No, no," began Cora, nervously, "Lady Vincent, don't urge me; it might make unpleasantness; it is better not. Sir Alan, I am sure would wish it so. I should not like——"

"Perhaps I have already consulted him," said Lady Vincent, with another entreating glance in the direction of the recess. "He thinks with me, that his wife and my Cora will get on very well together. You need not fear, my child; she is a sweet girl, and worthy even of my son's love—no small praise from a mother's lips"

She concluded with a light laugh; but Cora seemed distressed, and almost terrified.

"Lady Vincent," she said imploringly, "you will let me go. I could not stay—you do not know—I should feel as if——I cannot tell you; but do not urge me to stay; it is better that I should go."

"Why better, Cora?" Lady Vincent asked, coolly. "For our sakes or for your own? Or is it that you are tired of our quiet ways?"

At first the young girl eagerly denied; then she tried to contradict, and stammered something about "wishing to travel.'

"So you would like to travel?" was the elder lady's quiet remark. "You and Marianna? I am sure Sir Alan would not allow it."

There was a momentary silence; then Lady Vincent took pity on the silent distress, which Cora tried to repress all signs of, and she put her hands to either side of the girl's face, and gently forced her to lift it to her view.

"You tell fibs badly, Cora," she said, smiling. "Tell me, dear, why is it better for you to leave us?"

Her tone was very gentle and kind; but her eyes were fixed on Cora's face with a very searching glance.

The girl could not meet it. She struggled to free herself; but Lady Vincent's clasp, though gentle, was very firm.

"Nay; but I must be answered, Cora, even if I answer myself."

Cora uttered a little cry of pain, and her head sank forward on Lady Vincent's knee. For a moment her ladyship hesitated.

Sir Alan, looking very pale and agitated, half rose; but an imperative movemnnt of his mother's hand repressed his desire to betray his presence.

"Is it as I think, dear child?" said Lady Vincent, very tenderly. "Am I right? Cora—my dear Cora—don't sob so. Do you think I shall love you less for loving him?"

Cora shivered, and drew closer to her. Lady Vincent put her arms round the girl, and drew her into her tender, motherly embrace.

"Hush, my poor child," she said. "You will be ill if you distress yourself so much. I understand now; but do not make up your mind until to-morrow. Even if Alan's wife should not please you we need not separate."

"I could not stay here," sobbed Cora, passionately. "Heaven knows how I long, how I pray for *his* happiness; but I could not bear to see *hers* yet."

"You must wait," said Lady Vincent, decidedly; and she spoke as much for Sir Alan as to Cora now. "You shall see her to-night, and—well, to-morrow we shall talk it over. Now, Cora, you must go and lie down, and I will send Marianna to you. I cannot have red eyes to-night."

She kissed her tenderly, and dismissed her.

Hardly had the door closed, when Sir Alan emerged from his hiding-place.

"Well," said Lady Vincent, triumphantly, "who was right?"

"Oh, mother!" said Sir Alan, "you have made me so happy, and yet I feel like a thorough——"

"Oh! yes, I know," laughed Lady Vincent, enchanted at the result of her diplomacy; "but all is fair in love, you know, and to-night you must introduce poor Cora to my embryo daughter-in-law."—To be continued.

CHINESE MAXIMS AND PROVERBS.

The pleasure of doing good is the one that never wears out.

Receive your thoughts as guests, and treat your desires as children.

For him who does everything in its proper time one day is worth three.

The less indulgence one has for one's self the more one may have for others.

He who wishes to secure the good of others has already secured his own.

Towers are measured by their shadows, and great men by those who are envious of them.

The dog in the kennel barks at his fleas, but the dog that is hunting does not feel them.

He who finds pleasure in vice, and pain in virtue, is a novice both in the one and the other.

The truths that we least wish to hear are those which it is most to our advantage to know.

The wise man does not speak of all he knows, but he does nothing that cannot be spoken of.

RECENT LITERATURE.

Francatelli's Modern Cook Book. A Practical Guide to the Culinary Art in all its branches. Comprising, in addition to English Cookery, the most approved and *recherche* systems of all kinds of French, Italian and German Cookery, adapted for the use of Hotels, Restaurants, Cake Bakers and the largest establishments, as well as for the use of all private families. By CHARLES ELME FRANCATELLI, pupil of the celebrated Careme, and late Maitre d' Hotel and Chief Cook to Her Majesty, Victoria, the Queen of England. With sixty-two illustrations of various dishes. Reprinted from the 9th London Edition, revised and enlarged. One volume, Cloth, price $5. Phila. Pa.: T. B. Peterson & Bros.

THE whole of the above, comprising 1,462 recipes, is in one large royal octavo volume of 600 pages, printed on the finest tinted paper, strongly bound, and forms the largest and only complete work on all kinds of cookery, of various dishes, and bills of fare for all days in the year, ever published. Every family, every cook, every restaurant, every eating house, every boarding house, every hotel and every cake baker should have a copy of this new edition of "Francatelli's Cook Book."

Scola, Price $1.50. Boston: Lee & Shepherd.

SCOLA has been denominated a "unique romance" and it certainly may be said to possess the merit of originality of design. Milton has bequeathed us Paradise Lost, but it was reserved for the author of Scola to give to the world in these matter-of-fact days a romance in prose of primeval interest. It is easy to believe that the general idea of the work as well as some of the leading incidents, were suggested by the great poet's masterpiece but the sublimity of the Miltonic conceptions is never attained. The descriptions of the gorgeous palaces of the Devas, the marvelous architectural grandeur of Sippera the "City of the Sun," and the miraculous exploits of the "Giants in the earth in those days," read like the fanciful creations of a fairy tale and, though treating of historical characters of antediluvian fame and the imposing wickedness of Lucifer and his fallen angels, it is wanting in the realism which would impart the dignity essential to the success of such a work. The descriptions of Lucifer and his court form the main theme though it purports to be the biography of Scola. She is the neice of Noah and finally marries her cousin Japhet. The interest centers in the temptation of Scola and her mother by Hesperus and Lucifer respectively. The latter yields and is destroyed, while Scola's influence does more than "raise a mortal to the skies"; through love of her Hesperus, the fallen archangel renounces Lucifer and renews his allegiance to Heaven. The description of the flood which overthrows Lucifer's dynasty and destroys all living things upon the face of the earth, does not accord with the Biblical account of that event. The author,s fertile imagination revels in the terrible accessories of earthquakes, volcanic eruptions and frightful tempests, while the spirits of the air join in dreadful conflict.

If a suspicion of anachronism is sometimes suggested by a latent idea or turn of expression, it is disarmed by the prefatory explanation that the manuscript was hurriedly and imperfectly translated. Notwithstanding these defects the book will be found very entertaining, the appendix and notes abundantly illuminating the dark passages.

Buried Treasure. By HARRY CASTLETON. Price $1.25. Philadelphia: Porter & Coates.

WE highly commend this book to young readers. Although there are frequent allusions to "Yanks" and "Rebs," there will be found no sectional or partisan spirit, such allusions being generally ill-natured emanations from old "Godfrey," who is the incarnation of covetousness, dishonesty and all uncharitableness. It is simply a story for boys about boys and hunting, riding and other out-door sports, with enough of plot and diversity of incidents to insure very enjoyable reading.

MAGAZINE NOTES.

HARPER'S MAGAZINE for May well befits the month, with its Italian poets, its Western song birds, and its beautiful Easter poem.

The Number opens with a beautifully illustrated paper entitled "Coast Rambles in Essex," by S. A. Drake, the author of "Nooks and Corners of the New England Coast."

The "Song Birds of the West" is contributed by Robert Ridgeway, our great ornithologieal authority, and is exquisitely illustrated by Gibson and Beard.

Eugene Lawrence contributes an interesting illustrated paper on the "Italian Poets."

Mr. Frances L. Mace contributes a beautiful poem, entitled "Easter Morning."

The third paper of the series of "Old Flemish Masters" is about Rubens, and contains some beautiful engravings after his most celebrated pictures.

The Emperor William's summer palaces are described in an illustrated paper, entitled "Along the Havel," by Arthur Venner, who, in the course of his articles narrates an interesting adventure of Carl Schurz's younger days.

The two great serial novels of the year—"Macleod of Dare," by William Black, and "The Return of the Native," by Thomas Hardy—grow in interest with every monthly installment. There are also in this Number, besides the illustrated story already mentioned, two interesting short stories.

A very suggestive paper on a subject, always timely, is contributed by William Blaikie, entitled "Free Muscular Development," showing by how simple methods the best physical training may be secured.

The Hon. F. H. Morse contributes a brief but important paper on the English Civil Service, with especial reference to its consular and diplomatic branch.

Henrietta Hardy's poem, "May Flower," concludes the body of the Magizine.

SCRIBNER FOR MAY—Is the medium of introducing to its readers eight new draughtsmen, from the ranks of the painters, viz.: F. E. Church, S. R. Gifford, H. W. Robbins, L. DeForest, Will. H. Low, Frederick Dielman, J. Alden Weir, and Walter Francis Brown, most of whom have contributions in the present National Academy. Among the engravings of this number are two by Marsh, and two by Cole, with blocks by many others of the leading American engravers.

The opening paper, "Merry Days with Bow and Quiver," is by Maurice Thompson. The present paper, which is the outgrowth of the increasing interest in this sport, is made up of fresh material including an account of an unique shooting-match between Gen. Lew Wallace's rifle team and Mr. Thompson's archers, in which the latter came off victorious. Another illustrated paper is by Edward Eggleston on "The New York Post-Office."

Under the title of "Bohemian Days," Margaret B. Wright gives glimpses of the light and shade of artist life near Paris. William M. Tileston writes of non-sporting dogs, with cuts of some of the purest-bred St. Bernards, Yorkshire terriers, Dandy-Dinmots, pugs, etc. "Camps and Tramps about Ktaadn" is a paper descriptive of the wood-life of painters, with suggestions to campers-out in general, who may also see the humorous side of the thing in "Camping-out at Rudder Grange"—a droll sketch by Frank R. Stockton. The first of Dr. Brewer's papers on the curiosities of "Bird Architecture" is given in this number.

"An Impossible Sory," "Lissy," "Little Rose and the House of the Snowy Range," and a light essay, "Concerning the Use of Fagots at Geneva," by Leonard W. Bacon, together with the usual excellent editorial departments make an unusually fine number.

SUNDAY AFTERNOON, May number, sustains the reputation of the first number, and steadily advances to the attainment of its ideal. "Periwinkle," by Eggleston, opens the number. "The Donkey's Miracle" and "In the Church Tower" complete the short stories. Satisfactory installments of the serials "Tom's Heathen" and "The Crew of the Sam Weller" are also given. "College Morals," by C. F. Thwing, is a most pertinent subject. Dr. Bacon gives his opinion concerning "The Constitution of Benevolent Societies," and Geo. A. Jackson writes on "The Alexandrian Schools." "Reminiscences of Washington Allston," tells pleasantly of the great artist. "Dr. Franklin's Investment," by Horace E. Scudder, unearths a but little known project of the illustrious philosopher in behalf of posterity. Every one who ever had anything to do with a church fair, should read "Ways and Means." "One Summer's Work" tells of a recent commendable philanthropic effort. The Editor has a very interesting department of his own, managed in a clever way quite out of the common. Edward Everett Hale will begin in the June number a serial entitled "Aunt Huldah's Scholars."

THE May number of the Eclectic Magazine presents an exceptional variety of subjects. The leading paper is a biographical sketch of Lord Melbourne, by Lord Houghton; and there is also a brief sketch of Il Re Galantumo. In science there are a very suggestive article entitled Can we separate animals from plants? and the first installment of a series on The Earth's Place in Nature, by J. Norman Lockyer. The European Situation, by M. John Lemoinne; Modern Greece, by J. P. Mahaffy; Popular Superstition of the Turks, and Pope Leo XII. are timely. The poetry includes Tennyson's Ballad of the Fleet, the longest poem he has published in some time; German Universities, French Home Life: the Influence of Women, On the Decay of Fine Manners, a touching story entitled Only Jean, Albatross Notes, and four more chapters of Mr. Black's Macleod of Dare, also a fine steel-engraved portrait of Sir John Lubbock, with biographical sketch make an attractive number.

LIPPINCOTT'S MAGAZINE for May contains an illustrated paper on Roumania, by Edward King. Also one entitled "A Mountain-Holiday." There is a variety of short and interesting articles. H. A. Huntington summarizes the entertaining career of Colley Cibber; G. H. Putnam describes the quaint streets and houses of Old York; Mary Dean utters a humorous "Counterblast at the Married Folks;" Frank Furness, the architect, gives some useful "Hints to Designers;" and Charlotte Adams has some reminiscences of Gustave Courbet, the Communist artist; while Mrs. R. H. Davis writes about Cremation, and Mrs. Lucy Hooper about the Paris Theaters. "Theodolinde," by Henry James, Jr., is a story of Parisian life, in the author's peculiar vein: "Hephzibah Guinness" is by Dr. S. Weir Mitchell; "His Excellency 'Old Ugly,'" by Rev. Wm. R. Baker, and "A Tragedy of Sedan," which is a story in verse, by Anna C. Green; the whole forming a most delightful and entertaining number.

THE Atlantic for May has an unusually varied table of contents. Recent Florence, by H. James, Jr., and From Ponkapog to Pesth, by Aldrich, are two excellent articles in the department of travel. Mark Twain and C. D. Warner contribute the funny element, while the editor speaks of some recent volumes of verse. Who Pays Protective duties, and The Silver Question Geolgically Considered are pertinent. H. H. Trowbridge, and Boyeson contribute the poetry. R. G. White continues to define what are, and what are not Americanisms. Mr. Bishop's Delinoid increases in thrillingness. The first death has occured and the gloom and misery of the climax seems to be engulfing the devoted reader. The contributors Club is piquant, and Recent Literature is amply criticised.

THE ELMIRA FARMER'S CLUB has recently been discussing the question of cooking feed for stock. Carefully collected statistics from dairies fed on cooked food and from dairies fed on raw food are given. The club has has handled this subject with that thoroughness and intelligence which have made it so famous. The weekly reports of the discussions of the Elmira Club are a prominent and valuable feature of the Husbandman. Our readers should send for sample copies of that agricultural paper and make the acquaintance of the most prosperous and useful Farmers' Club in America. Address the Husbandman, Elmira, N. Y.

THE AMERICAN NATURALIST for May opens with a very interesting article from the clever pen of W. J. Beal on Hairs and Glandular Hairs of plants. Their forms and uses. C. V. Riley continues to talk On The Transformations and Habits of the Blister-Beetles. An Examination of Professor Leo Lesquereux's Theory of the Origin and Formation of prairies is made by O. P. Hay. Notes on Indian Manners and Customs by Edward Palmer is very interesting. General Notes, Recent Literature and Scientific news departments are as ample as usual.

"WOMAN AT WORK" (Louisville, Ky.,) appears this month (April) in a new dress, and one which reflects great credit on the taste of the publisher. It now contains 20 large royal octavo pages, printed on the finest book paper, cut and stitched ready for binding.

This magazine is devoted to the interests of women who are obliged to support themselves, and it aims to advance the welfare of the sex by ennobling labor, encouraging industry and promoting education and culture among women. So meritorious an object should commend the magazine to the patronage of all women who care for the welfare of their sex.

ST. NICHOLAS opens with a story by Mary H. Foote, illustrated by herself. L. P. Hale continues the "Peterkins," Irwin Russell tells about "Sam," and these together with poetry and illustrations and serials meet the demands its exacting young readers have been educated to make upon it.

BRIC-A-BRAC.

SHIP-BRED—Sailors.

MADE of awl-work—Shoes.

EVENING prayers—Burglars.

SLAY-RIDE—A cavalry charge.

GOOD name for a wood-cutter:—Hugh.

"BEAUTIFUL Ile of the Sea"—whale-oil.

BLUNT men sometimes say cutting things.

EVERY dove has a cote, and every dog pants.

AN admirable illustration of the sternness of English conventionality is furnished in an anecdote about a young lady who attended the last reception held by Queen Victoria at Buckingham Palace. This young lady was horrified at being approached by one of the functionaries, who informed her that her hair was coming down. She explained that her hair was not coming down at all, but that a *coiffeur* had expressly dressed it in that manner. "Put it up," was the order; and she was compelled to do so. A species of supervision is exorcised over each lady who enters, to see if there is anything in her costume that transgresses the rules.

TO BAYARD TAYLOR.

To-day, to thee two nations stretch their hands;
The palms of one, down bent and closing, tell
Of Love's distress at Duty's forced farewell;
The other beckoning, open-palmed, demands
Exultantly thy coming. Prideful stands
Thy Guild beside thee. Simultaneous swell,
With not a single unaccordant bell,
The chimes of two benignant Brother-lands,
In pœan each. To thee thy own hath said:
"We can to thee no plenary powers impart
Already are not thine. Envoy thou art,
'Extraordinary' by culture, to the head,
'Plenipotent' by nature to the heart,—
By every grace to every Grace 'accredited'!"

[Springfield Republican

POET'S CORNER, Westminster Abbey, is not so much of a poets' corner as it is popularly supposed to be. The remains of Shakespeare, Milton, Shelley, Byron, Wordsworth, Elizabeth Barrett Browning, Fletcher, Pope, Gray, Cowper, Keats, Coleridge, Marvell, Thomson, Collins, Goldsmith, Crabbe, Mrs. Hemans, Marlowe, Beaumont, Herbert, William Browne, Vaughan, Waller, Herrick, Shenstone, Chatterton, Hood, Moore, Southey, Leigh Hunt and Kemble do not repose there. Burns was buried at Dumfries, and Scott at Dryburgh Abbey. When one thinks of the multitude of England's singing birds, it is rather the exception than otherwise to find a poet buried in the abbey. It is true that in Poets' Corner are buried Addison, Jonson, Macaulay, and Lord Lytton, and they all wrote more or less poetry. But they were not, strictly speaking, poets. It is their prose writings that have gained them their reputation with mankind.

"BUCKET VERSUS BOTTLE."

Suggested by Samuel Woodworths' Poem, "The Bucket."

Athirst, in my dreaming, I sought for the bucket,
Immortalized now by the pen and the press,
I found it still hung in the well of the poet,
Away on the skirts of the vast wilderness:
"The old oaken bucket, the iron-bound bucket,"
Away on the skirts of the vast wilderness.

A hand in my dream, seem'd to hold out a bottle
And tempt me to drink; but the tempter was screen'd;
"Resist!" was the word, and the power came with it
And splash went the bucket and off flew the fiend:
"The old oaken bucket, the iron-bound bucket,"
And splash went the bucket, and off flew the fiend.

'Twixt hurry and skurry, he let fall his bottle,
Which dash'd into fragments, the liquor dispers'd:
An emblem, methought, of the ruin that follows,
When man to the bottle resorts in his thirst,
And not to the bucket, the health-giving bucket,
When man to the bottle resorts in his thirst.

Then come to the bucket, and fill up your glasses,
And turn not away from the drift of the dream;
There's death in the bottle, however attractive,
And life in the bucket, whate'er it may seem;
"The old oaken bucket, the iron-bound bucket,
The moss-covered bucket," whate'er it may seem.

WIT is sometimes of good service to the statesmen or diplomatist. When Queen Elizabeth first proposed to Defoe, the famous civilian, to employ him on a diplomatic mission to Flanders, she told him among other things, that he should have twenty shillings a day for his expenses, which at one time was thought a liberal allowance. "Then, your Highness," said the doctor, "I will spend nineteen shillings a day in your Majesty's service." "What will you do with the odd shilling?" said the queen. "Oh, I will reserve that for my wife and two children." This answer had the effect intended, and a considerable increase was made in his allowance. Notwithstanding this, he was pressed for money during his stay in Flanders, and thought of a novel plan to get a supply; he sent in a packet to the Secretary of State two letters: one addressed to the Queen and the other to his wife, which he misdirected, so that the letter to his wife was addressed "To her most excellent Majesty," and that to the Queen inscribed "To his dear wife." The Queen, having opened the letter, was surprised to find it beginning with "Sweetheart" and afterward interlarded with "my dear," "my love," and other affectionate expressions. It concluded with requesting her to be very economical, for he could send her nothing, as he was very short of money, and could not think of trespassing on the bounty of her Majesty any further. Whether the queen suspected the trick, or believed in his necessities, is not certain, but an immediate supply of money was sent both to the doctor and his family.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DRAWN!

THIS is a lady's sketching book,
Left careless in her favorite nook,
For any person who comes to find.
This is the landscape, looking hence;
This thing is probably a fence;
And—am I blind?—

A portrait! Seems to me I've met
The gentleman before—and yet
I *can* not know this fearful guy.
And yet—this coat—those trousers—that
Dilapidated Alpine hat—
By Jove, it 's I!

I really was not aware
I was so very short of hair—
And such an overpowering forehead!
And it may be that is my nose.
Peculiar, very! I suppose
She calls me "horrid."

Who is she, then, this artist fay
Who makes the hapless poet her prey,
Whom woodland solitude allures;
Who, under pretext of a sketch,
The unsuspicious, wandering wretch
Caricatures?

What saucy little fingers deft
These misused pages thus have left?
And did she know this was my path?
I wished that she would venture near;
She has no special cause to fear
My righteous wrath.

I am not very fair to see,
But for all that, sweet, I may be
A little wise—a trifle witty.
And I can only hope that you
Are very sweet and very true,
And very pretty.

Some day, just as I'm strolling now,
I'll meet you; and I hereby vow
I'll make you, ere I let you by me,
Raise that—presumably—fair head
While I from lips I know are red
Indemnify me.

[Puck.

TOBACCO.

STARR MORIS.

Although reform is the order of the day hardly anything is said against the almostuniversal use of tobacco nor of its deleterious effects upon the human system. Occasionally some Temperence lecturer includes it among the stimulants to be avoided, but as a general rule, the pernicious habit is passed by in silence.

In the Popular Science Monthly of November 1874, there was a paper by Mr. FRANCIS TERRY FAIRCHILD in which he gave with great minuteness, the details, of his investigation of the effect of tobacco upon himself. GODEY, of the Ladies' Book, in his review of the article, says, "men are inclined to believe that the opposition to smoking is a woman's notion, but MR. FRANCIS T. FAIRCHILD is a well-known and celebrated professional man, and his investigations were conducted in a most careful and rigorous manner. We have not space for detail: sufficient to say that tremor, sleeplessness, bad dreams, craving for stimulants, and general ill health, always attended the use of tobacco, and always disappeared a few days after the cessation of the habit"

Mr. GODEY further remarks "The disagreeable effects upon the senses of others, produced by the tobacco-user, it may be in vain to insist upon."

And this is the point to which I wish to draw attention: the effects produced upon those who are in close contact with the tobacco-user. For I have had an experience so unexpected and startling, that I should like to give it to the readers of the RURAL, premising only that that of which I write occurred before Mr. FAIRFIELD'S investigations were published, so I was not influenced in any manner by anything I had read.

I had for a long time been troubled with what I called terrible nights, nights spent with wide open staring eyes, or if I slept at all, my sleep was filled with such fearful dreams that I felt as Job did, when he said "Thou terrifiest me with visions." The trouble culminated after a short illness that had left me in a weak, nervous state. Then terrors took hold of me and my life became a burden. However quiet and peaceful my days and evenings were, as soon as I retired and fell asleep, the most dreadfull terrors assail me. I was plunging off a precipice down, down, into utter darkness, or I was being crushed under a railroad train, or I was drifting, alone in an open boat, in the wide ocean at the mercy of the wind and tide. Huge monsters of the deep threatened to drown me; the dreadful sea-serpent lifted his awful head over me and pierced me with his sinister eyes. The clouds dark with tempest closed down around me, while forked lightning lit up the awful scene.

Horrible forms surrounded and crowded upon me, fiends seemingly from Dante's Inferno leered and jeered and threatened me, until I awoke bathed in a cold sweat and trembling with fright to spend the rest of the night trying to assure myself that it was only a dream.

These experiences were all the more strange as I am not timid but am naturally strong and courageous. Physicians were consulted, anodynes were prescribed but without effect.

"The nights, just like the night before
In terror passed away:
Nor did the Demons vanish hence,
Until the break of day.

I noticed that sometimes, when away from home, I slept well and so concluded that something was amiss with my sleeping room. I repapered and painted it, but found no relief except at short intervals, occasionally.

At length we changed our place of residence and for some months I slept like a child and congratulated myself that I had left the cause of all my trouble in our distant home.

When upon retiring one night, tired and sleepy, all the old terrors returned and Oh! the horrors of that night I cannot describe.

In the morning, while thinking over what I had suffered the past night, I suddenly remembered that once, when I turned to my husband for sympathy I noticed a faint odor of tobacco on his breath. The cause of all my trouble flashed in an instant upon me.

My husband is rather erratic in his habit of smoking; sometimes smoking a great deal and then not smoking at all for weeks or months, as the notion takes him, and I knew that he had not smoked for some time past. Upon inquiry, he said he had smoked the evening before. Here, then was a revelation. The odor of tobacco when inhaled from his breath, had the same effect upon me that opium has upon others, with this exception, that their sensations are sometimes of a pleasureable nature, while mine were of the opposite character.

Now I do not dislike the odor of tobacco. Indeed, I rather like the smell of a good cigar and never thought of attributing my trouble to that. Upon comparing notes with my husband I found that in every instance, as far as we could recollect, my troublesome nights corresponded with his seasons of smoking—my restful ones with his abstinence from it.

To convince ourselves we tried experiments and found invariably, that the same cause produced the same effect. He, being rather incredulous, would sometimes smoke away from home and keep at a respectful distance after his return. I would retire unconscious that he had done so, only to spend the night in misery. So the habit was abandoned with some reluctance on his part I will admit, but with good results for me. I can count the time, not by weeks or months, but years, in which my sleep has been restful and quiet, undisturbed by the phantoms of a diseased brain. Now, if inhaling the odor of tobacco from the user's breath produced such an effect on a strong, robust person, what may not be its effect on delicate women and children?

We are called a nation of nervous invalids, and this is true of a large proportion of our women, and may not the cause be traced, in some measure, to the almost universal use of tobacco by husbands and fathers? It is said that the care of the life and health of the men of the family are entrusted to the women of the household; and that the women should be able to persuade their sons to abstain from *all* stimulants, as a rule of healthy life. I am afraid that it would be hard to persuade them against the constant example of their fathers.

It also may be said that some foreign nations smoke immodcrately, and yet their women are healthy. I think it might also be said that the women of those nations spend most of their time in the open air and in many instances occupy separate sleeping-rooms.

Leaving this question for others to discuss, I will only say that if my experience gives some poor, feeble, sleepless sister a hint to profit by, I shall feel amply repaid.

AUNT SUSAN'S EXPERIENCE IN DOOR-YARDS.

B. C. D.

THERE was an old-fashioned quilting at Mr. JONES', and the farmers wives from far and near were gathering in. Aunt SUSAN BROWN seated at one corner of the quilt beamed a kindly welcome on each arrival. In spite of her sixty years she was a general favorite. Presently a young farmer's wife whose face was marked with lines of care, and whose brown hands betokened hard labor, passed around and seated herself next to "Aunt SUSAN," greeting her with a wistful smile as if longing for a word of sympathy. While they were nearly alone in their corner, the younger woman said, "Now that I have a chance I wish to ask you how you manage to have such a nice dooryard. It is always a treat to me to pass your house and look at your plants and flower beds. I long so for such surroundings. When we moved on our place six years ago, I told JOHN that the mustard and pig-weed in the front yard made me feel homesick. He said that after this and that improvement was made, he would fix up everything in the yard in good shape, and he meant to, but so many things came along, one after another that must be done, that I seem just as far as ever from having what I prize so much. Something seems wanting in my life. You know that I have two small children and do my own work, and it seems like too great an effort to attempt anything alone. So I thought I would ask you how you had succeeded so well." "I think I can help you said Aunt SUSAN heartily. "When we started on our farm years ago it was a dreary looking place. We only had a zig-zag rail fence around the house and garden, very poor at that, and I know my husband had enough to do with looking after his crops, so I was left to my own devices. I had noticed that nearly every one failed by undertaking too much; they wanted a great many varieties of every sort, making in short a disagreeable hobby of their flowers

So I began moderately, first with a single root of red peony, and a damask rose-bush. I kept the sod away from the roots and gave them the benefit of fertilizing earth, from the barn-yard, and if I could only carry a spadefull a day—I always tried to do as much as that. The next year I added one or two more to my stock, but never more than I could keep in fine condition. I often had to let some of my sewing or housework go to attend to things in the garden, but it paid me in the end in health and enjoyment. I set out some phlox and honey-suckle between the currant bushes, and they grew and bloomed to my heart's content. The former owner had left a huge pile of stones, near the front gate, which troubled me a great deal until I thought of turning it to account. I took off the stones from the top, filled the hollow space with dirt, and sowed flower seeds in it, and when they came to blossom it was no longer unsightly, but on the contrary very ornamental. I worked in this way slowly, but by the time my oldest boy was large enough to help me I had quite an array of blossoms, which all the family have since taken pride in keeping in order. But when a common practical farmer like your husband and mine, will, after doing the regular farm work in his line, take interest enough in a door-yard or flower garden, to do much work there, he is too perfect a specimen for this world. We women who love the beautiful must take the first steps to gratify that love and we must hold fast to our innocent and elevating tastes, or else in the hurrying cares of life, they will never be gratified. If we are sneered at or ridiculed, for wasting our time on things which have no money value we need not argue the case, only work right on silently and persistently. Men grow to prize the beautiful things by seeing them and will often then lend a helping hand without being invited to do so. I see you get my idea." And Aunt SUSAN had the satisfaction of seeing her younger friend leave her side with a brighter expression of hope than she had worn of late, and she doubted not that the good seeds she had sown would in the future bear "abundant fruit."

A PLEA FOR THE MINISTER'S WIFE.

GRANDMOTHER.

I HAVE been thinking a good deal lately about ministers and their wives. Perhaps the reason is that the wives wear out so soon. I have seen women who, only a little while ago, were young, blooming brides, grow pale and thin, and look as careworn as women of fifty, while their husbands were young and bonnie as ever. I do not believe that a real healthy minister's wife can be found in all New England; that is, after they have been married half a dozen years. I think they are an abused class of humanity. Who cares how hard they have to work? No purses are ever made up to send them on European tours. Who ever thinks of the unending stream of visitors that are forever going to the minister's, to visit and call, not counting every minister that comes to make a hotel of the parsonage. Then the minister's wife must attend every prayer and conference meeting, in all parts of the town; she must be president or chairman of all the societies that are gotten up for various charitable purposes; she is expected to do her full amount of sewing for the *Circle*, and in fact about three times as much work as any other woman in the town.

Now, if I were a minister's wife (and I reckon it is a nice arrangement for some people that I am not), I should rebel. If they expected me to work for the society and the church, I should have a salary; and if I did more work than the minister did, I should demand a salary accordingly.

What right have a community to expect, or require, all these things of a little, inexperienced, delicate woman? Just because she happened to fall in love and marry a clergyman, is it any reason why she should be made a slave, for the convenience of the people in his charge? Her husband works for the good of his church and society at large, and he *has his pay for it*. Why should not his wife have pay too? She might then be expected to have an outside interest, and well afford to hire her own work done.

It is all wrong to demand more from the minister's wife than from the deacon's wife or the doctor's wife. Does society expect these women to devote their time and strength outside of their homes and families? Oh no! but a minister's wife is a different person entirely! She can do so much good! Pay her for the good she does, I say; and remember that she is mortal, and do not expect her to suffer martyrdom for the sake of the church and people.

A CHEAP BUT PRETTY ORNAMENT.

L. E. K. T.

I SAW a pretty cross the other day that perhaps some of the Rural girls would like to imitate. For the foundation, the pasteboard was rolled up and fastened in hollow cylinders (such as are used to wrap pictures on when shipping them.) The ends were closed with white paper. Letter paper was used for the one I saw, but if it had not been ruled it would have been prettier. A sheet of paper that had been doubled together and cut into fine strips, to within a quarter of an inch of each edge was then pressed out, doubled together and fastened around the cross with the cut part left rounding to give it a feathery appearance. These papers were fastened close together the feathery part of one overlapping the fastening of the one before it. At the crossing the fastenings were hidden by a rosette of the cut paper. The cross was fastened to a firm foundation and was about eighteen inches high. It was very dainty looking and many admired it.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

HOUSE-HOLD HINTS.

A good housekeeper takes pleasure in seeing everything fresh and bright as well as clean, and the heart of the "house-mother" sinks with dismay as she looks at the spotted, faded paper and worn paint, and remembers the collapsed state of the family purse. There is no reason why you should not do your own painting and papering. Any painter will mix the paint for you. At paint stores in cities are found ready-mixed paints of all shades that will give perfect satisfaction. This paint will sometimes require to be diluted with linseed oil towards the bottom of the pail, but it adheres evenly and looks beautiful when finished. You will need a large flat brush, and a small sash brush for windows. An old shaving-brush will do for the windows and corners, if you have no small brush. Do not fill your brush too full. Commence at the top, and paint down, taking as long a sweep as you can, spreading the paint evenly. If your paint is not white, it is always a safe and good rule to have the wood-work of the same shade as the ground of the wall-paper. For doors, a warm gray shade for the frame, and a darker shade for the panels are pretty. A little burnt-umber mixed with white paint makes a good pink shade, while a good deal makes a dark brown. My mother painted four rooms, (one coat,) this spring, at the cost of $1.60, or 40 cts., a room. All varnished paint should be washed with cold tea; for white paint, take a flannel rag, wring out and dip into a dish of whiting, and rub your paint until it shines. Rinse off with a clean cloth dipped in cold water. If your ceiling is very soiled, pour liquid blueing, freely, into the white-wash.

In choosing paper, you will have ample opportunity to exercise your taste. Even the yellow-backed kitchen paper may be put on with the wrong side out, presenting an even, buff shade that makes a good back-ground for pictures and looks well. This comes at 10 cts. a roll; better qualities at 20 cts; satin-faced at 25 and 30 cts., and gold papers at 75 cts. per roll. The plain satin papers are pretty, but very difficult to put on nicely. If your wall has been white-washed, wash the surface with vinegar to make the paper stick. If you find any difficulty in removing the old paper, make some very thin starch, and while quite hot, wash the paper, giving a second coat in a few minutes after. The paper will then strip off, in long pieces.

A good way to make paste to put the paper on with, is to soak white glue over-night, then boil until dissolved; rub flour and water together until smooth; add, and boil until like starch. Measure off the paper, and cut a number of lengths by it, being very careful to see that the figures match. Lay the lengths, with the face down, on the table, spreading the paste on the top one with an old white-wash brush. Double the bottom of the paper over, so the under sides will go together, stick the top fast, unfasten the bottom, and brush down with a soft rag, or whisk broom. Be sure and match the design, and bring the edges evenly together.

Kalsomining is cheaper than papering, but harder work. Take a quarter of a pound of white glue to six pounds of Paris White; cover the glue with water and let stand until soft; then put the vessel containing it, into a kettle of hot water, and stir until thoroughly dissolved. Put the Paris White in a pail and add hot water gradually, stirring all the time, until it is smooth and creamy; then add the dissolved glue, with water enough to enable it to work well under the brush. Put on with a fine white-wash brush. This can be tinted any shade you choose

If your carpet is badly worn in the centre, rip the seam and reverse the carpet, after the manner of turning sheets. For grease spots, a little fuller's earth, dissolved in hot water laid on the spots and scoured with a brush, is the most effectual remedy. A bullock's gall added to two quarts of water, is an excellent thing for reviving faded colors and removing dirt. Holes can be nicely mended with worsteds of colors to match the carpet. If the plating around the door knobs is worn off, put together in a glass vessel one ounce of nitrate of silver, two ounces of cyanuret of potassa, four ounces of prepared Spanish whiting, ten ounces pure rain water, cleanse the article to be plated, and apply with a soft brush, burnishing with chamois skin.

Curtains are a great help towards a pretty room, and cheap ones can be made from unbleached muslin, chintz, plain or dotted Swiss muslin. Even those of bleached muslin, trimmed with a fluted ruffle along the edge, are dainty enough to please any one. Unbleached muslin is now used to a great extent, and looks well. Colored canton flannel, in blue, brown and crimson, makes an effective trimming; put one or two deep bands of this across the bottom of the curtain stitched on in feather stitch with yellow silk or zephyr. A piece of muslin, two yards long and 18 or 20 inches wide, bordered with a couple of colored bands, and edged with fringe, is laid in deep plaits, and fastened to the cornice. Lambrequins are such an addition to a room that every one should make them. Chintz edged with a ruffle and pinked on either edge are easily made, and even the common red-and-white striped cotton goods, trimmed with fringe look well. Old curtains which are too short for the window can be pieced down under the lambrequins. If your window is low, you can greatly add to its apparent hight by placing the lambrequin on the wall above.

A divan for your room can be easily made by asking John to make you a box two feet wide, two feet high and six feet long. Spread straw on the top of the box, but do not allow it to come too near the edge. The straw should be covered with refuse cotton, laid on evenly, or with an old blanket; be sure and cover the sharp edges with the cotton. Cover the cotton with coarse brown muslin, and tack the chintz over this; the sides should also have a cover of cotton. Large square pillows stuffed with shavings, and trimmed with cord and tassels are laid against the back of the sofa. There should be a binding of braid for the cushion, to match the chintz. Barrels make easy chairs by sawing one-third in two, about 18 inches from the bottom, and sawing the staves in a curved shape for the back. The head is nailed in for a seat, and the back and seat are padded with straw or hay covered first with an old quilt, and then with the chintz. Ottomans to match are made of cheese or soap boxes.

A book-case can be made of two packing-boxes, set upon each other; shelves nailed in, and a cheap molding fastened to the edge of shelves and sides. If the boards are not perfectly smooth, sand-paper, then stain with walnut stain and varnish. A tiny valance of pinked leather fastened on the edge of the shelf is a great improvement. A foot-mat is beautifully made, by taking old pieces of woolen rags and cutting an inch wide on the bias; gather one edge with a strong linen thread, and sew the gathered edge on to an old piece of carpet, as a foundation. Make a center three inches in diameter of crimson-edge this black, then scarlet, next gray, then black, crimson and gray in order, and fill out the square with black; this is the design of mine. These mats have a velvety look, and are pretty enough for any sitting-room. Ida Atwood.

LEAMON'S DYES.

I received from the Editors of the Rural an assortment of Leamon's Aniline Dyes manufactured by Messrs. Wells, Richardson & Co., of Burlington, Vt., requesting me to give them a careful trial and to report the results without fear or favor. The trial has been made and I am pleased to state with results eminently satisfactory. Heretofore I have not had much faith in home-dyeing of goods, and with little expectation of success, I made my first attempt with these dyes, viz., that of coloring a soiled white ostrich-tip light-lemon. The feather was valueless as it was, but when colored and curled looked almost new. I have colored white stockings dark-blue, light-blue, brown and pink, dyeing a skein of darning-cotton with each color, to mend with as needed. They are free from spots and do not crock. A brown dress recolored was improved very much and I shall never feel that it is necessary to send another garment away from home to be dyed, as has heretofore been my practice. I also used them with satisfaction for baskets, grasses etc. Indeed, I fancy from my own tests that there is scarcely any articles that cannot be colored by their use. This does not involve much of either time or trouble and is certainly a decided saving of expense.

DOMESTIC RECIPES.

Batter Pudding.

One pint of milk; four well beaten eggs; two cups of flour; one teaspoonful of salt and a pinch of soda. Bake three-quarters of an hour or boil in a buttered mold or floured bag two hours; serve with sauce and eat at once.

Lemon Jumbles.

One egg; one cup of sugar; one half cup of butter; three teaspoonsfuls of milk; one-half teaspoonful of soda and one of cream-of-tartar; juice of two small lemons, and the grated rind of one; mix stiff.

German Puffs.

Three beaten eggs; three cups of milk; three teaspoonsfuls of melted butter; three cups of flour; a small spoonful of salt; pour into nine well buttered cups, same size as used in measuring; bake to a fine brown and eat as soon as done with sauce.

Ginger Snaps.

One coffee-cup of butter and lard mixed; one coffee-cup of sugar; one coffee-cup of molasses; one-half cup of water; one tablespoonful each of ginger and cinnamon; one teaspoonful of cloves; one teaspoonful of soda dissolved in a little hot water; flour to mix. Miss Alice Demarest.

River Edge, N. J.

Almond Rice Pudding.

Wash twelve ounces of rice and put into a stew-pan with little more than one quart of milk; eight ounces of sugar; four ounces of butter; four ounces of almonds blanched and pounded; add a little salt and boil *very gently* on the back of the range until the milk has become absorbed by the rice; remove from the fire and when cool mix in the yelks and whites—beaten separately—of four eggs; blanch and split into halves four ounces more of almonds and strew equally over the inside of a mold previously buttered; pour in the rice and bake for one hour and a half. Turn out and serve with any kind of preserve around the base.

Strawberry Cream.

Pick the calyxes from two quarts of strawberries and crush them in an earthen-dish with one-half pound of sugar; put through a sieve and mix with a pint of whipped cream, adding one ounce and a half of dissolved isinglass; pour into a mold and when firm turn out and serve.

E. M.

QUERIES ANSWERED.

Will you please give me a recipe whereby I can successfully can green corn and peas? I have tried several times and failed.

Deer River, N. Y. Mrs. S. S. C.

Ans.—Cut the corn from the cob and add water sufficient to cook; have dissolved one ounce of tartaric acid in one-half teacupful of water and when the corn is about one-half done, add of the acid solution one tablespoonful to every two quarts of corn; when done seal air-tight in glass or tin; the latter is preferable. Many punch a small hole in the top of the can the day after sealing to allow the gases to escape, resealing at once. To prepare for the table, pour off the sour water; add water, a little soda and sugar and boil; then season with cream, butter, pepper and salt the same as fresh corn. I have had no experience with canning peas, nor have I a trustworthy recipe. I will, however, give you my method of preserving peas for winter use. Shell and boil in salt water eight minutes; drain, dry on a cloth, and when perfectly dry, put into wide-mouthed bottles, not quite filling them, and cover the peas with melted mutton-fat, sealing air-tight with rosin or wax.

News of the Week.

NEWS OF THE WEEK.

At home, Mr. Gorham, of California, has been again elected Secretary of the Republican Committee. Mrs. Tilton's example of last week, has been followed this week by disgraceful confessions of rascality on the part of several officials and others who were connected with counting the votes in Florida at the last presidential election. Dennis, and M'Lin are the two chief self-confessed scoundrels whose fraudulent manipulations of the votes of some of the back-woods sections of the State placed Hayes in the White House instead of Tilden. It is said, however, that it is the latter's money that has awakened their consciences to a public confession of their villainy. Doubtless disappointment at their failure to get promised offices, together with a little encouragement from malcontent republicans has also had something to do with it. Then again even the *vilest* sinners may reform! It is very doubtful whether any Congressional action will be taken in the matter. The President says he will subscribe to the Republican fund for the coming campaign and will not object if office-holders do the same—so much for another item of his Civil-service Reform! To the disappointment of Packard, Anderson and Co., a Geo. L. Smith has been nominated for Collector of New Orleans, and seems to be acceptable to all factions in the Pelican State. This is one of the Republican Smiths. The President knows that third-rate men often meet with less opposition than those of first-class reputations. Savings Banks continue to burst up all over the country, but especially in this State; surely it's time to pass some stringent laws with regard to their management, and to place more of their managers behind prison bars for safe keeping. The President has been "swinging around the circle" a little in Pa: well received by the people at large, but neglected by politicians.

The present bankrupt law has been repealed by the House and Senate and will be signed this week doubtless, by the President. This does not affect proceedings taken before its passage. There have been terrible hurricanes in some parts of the West and South: barns, houses, fences, etc., destroyed; trees uprooted, a large number of people killed, some of them under ruins of buildings, and others by being taken up into the air by the force of the whirlwind. The Wood tariff bill seems doomed to defeat in the House, a majority there being counted upon against it. The movement to resume specie payment is spreading considerably, though there is little doubt that it is often a mere advertising dodge on the part of institutions which make a single payment or two in specie, in order to get their names before the public. The Moffet Bell Punch is now one of the legalized institutions of La., much to the disgust of the liquor dealers.

"We don't want to fight, but by Jingo, if you do,
We've got the men, we've got the ships, we've got the money, too."

Such, for the last six months or more, has been the chorus of the most popular song that has fired the British heart as it echoed from lips of street urchins and music-hall favorites in the towns and villages, or in rustic accents and various dialects, broke the stillness of thorn-hedged lanes and other country places. The belligerent spirit this lively doggrel has helped not a little to rouse, is likely, ere long, to find ample exercise; for across the Atlantic the prospect of peace is daily growing more gloomy. Already a second army corps is about to be got ready for service, and England has nearly completed her preparations for war. Gradually both at home and abroad, the conviction is growing stronger that amid the conflicting rumors that fill the public with uncertainty and doubt, a steady hand at the helm of the ship of State, is steadily steering her into battle, that Lord Beaconsfield—better known as Disraeli—has from the first resolved unalterably upon war in the event of England's demands being disregarded. Bismarck is still pressing the assemblage of a Congress at Berlin, and to clear the way for it, is urging a preliminary conference of ambassadors from the Great Powers in that city. Before accepting his invitation, however, England demands an explicit declaration from Russia that the latter will allow the whole Eastern Question to be treated as a matter of European not merely of Russian concern. Just here is where the hitch has been all along, and it has not been yet removed. Italy, prompted probably by Germany or possibly by Russia, has asked England to state openly what alterations she wants made in the treaty of San Sefano. England, unwilling to show her hand to her astute opponent, evaded the question by saying it would be useless to make such a statement until Russia had agreed to accept European intervention in arranging all the terms of settlement.

On the 30th Gen. Todelben succeeds to the command of the Russian forces in Turkey instead of the Grand Duke Nicholas, who returns to St. Petersburg on the 1st of May, on account of his health. He has just been raised to the rank of Field Marshal. Latest advices say that the English fleet will withdraw to the Dardanelles and the Russian army to Adrianople—a desirable consummation, but hardly probable. A fierce revolt has taken place in Bulgaria and upper Roumelia. The Bulgarians began to avenge past subjection and cruelty on the Turks resident in the country by out-Herodingd Herod in pillage, outrage and murder. The Turks hadn't yet learnt submission to brutality, flew to arms, retaliated, were joined by some of the Ottoman regular troops and hosts of disbanded soldiery that had found refuge in the mountains, and now the worst scenes of destruction and barbarity that ever disgraced the land are enacted therein. Several detachments of Russian troops have been defeated by the insurgents, and the Muscovites are calling loudly on the Porte to order the battling Turks to submit to whatever may be in store for them. Great mortality from fever is said to be prevalent among the Russians. Bismarck reported to be tired of his fruitless efforts at mediation. Servians again preparing for the field; Roumanians still recalcitrant; Russia may be content with a slice of Bessarabia—if she can't get more.

An agrarian offence of a novel character has, it is alleged, been committed by a man named Hyffe, now in the county jail at Limerick, Ireland. Hyffe it seems, rented some orchards at Adare, but he was, for some reason, evicted by the owners to whom his tenancy did not give satisfaction. It was discovered that all, or nearly all the fruit trees had failed; and the prosecutors allege that the prisoner, with an auger, bored a hole in each of the trees and destroyed their vitality by introducing a quantity of vitriol into their trunks.

Corinth, Maine, Feb. 12, 1878.

To The Davis Sewing Machine Co., Watertown, N. Y.—*Gents:* We are manufacturers of clothing; have been engaged in the business for the past fifteen years, manufacturing largely for Miner, Beal & Hackett, Isaac Fenno & Co., A. Sherman & Co., Smith, Richardson & Bates, Prager, Bock & Co. and Leland, Rice & Co., all of Boston. We have used the Davis Vertical Feed Sewing Machine for the past four years in manufacturing our clothing, and we know that it is better adapted to our business, and possessed superior advantages over any of the under-feed sewing machines.

Within the last three months we have had occasion to seam our clothing with double thread, and we find that the Davis Vertical Feed Sewing Machine (and no other family sewing machine) will do the work as well and easily as with the single thread. Yours, truly, T. Brackett & Son.

THE MARKETS.

PRODUCE AND PROVISIONS.

New York, Saturday, April 27, 1878.

Beans and Peas.—Mediums beans are firm without much activity. The demand however is quite equal to ordinary spring trade and holders are not anxious to sell. Marrows are a degree more active still the exportation is not large enough to give much buoyancy to the market. There has been some activity in pea beans but they close dull. White kidneys firm and held higher. A small trade in red. Black beans quiet. Green peas trending lower, $1.07½@1.10. Southern B. E. peas nominal at $2.80@3. Canadian in bulk and bond hold their old rates of 83@84c.

Receipts of beans, 3,550 bush.; exports peas, 21625 bush.; exports, beans 756 bbls.

We quote:—Beans, medium choice, $1.65@1.70; other. $1.30@1.50; marrows, free to vessel $1.85@1.87; fair to good, $1.60@1.75; pea, $1.35@1.55. White kidney, $1.40@1.70; red, $2.10@2.40; Black (Turtle Soup) $2.50@2.65.

BEESWAX.—Small sales are being made at 27@28c. for Western and Southern.

Exports past week, 4,331 pounds. Since Jan 1st, 76,600 do., or double the quantity of this date last year.

BROOM CORN.—A small trade is in progress.

Quoted at 6@7¼c for hurl and short brush; 5@6¼c.: for medium green, 4@4½c. for red and red-tipped, ₩ lb.

BUTTER.—The butter market is proverbially an uncertain one between "hay and grass" and the present period is not an exception to the rule. Regular and liberal receipts give buyers considerable independence, especially as the supply is chiefly white and must not lose an early sale. The business of the week has suffered from one or two rainy days and the accumulation that formed was sufficient to break down prices. Thus we have fine creamery pails and choice half tubs selling quite closely in prices. No style of purchase in State exceeds 25c. Western is very weak for white as some samples yellow are already coming forward.

State and Western creamery, choice 24@25c., other 20@23c.; State half tubs and pails selected, 23@24c.; good, 20@22c.; poor State 17@18c; Welsh tubs prime 22@23c; other 17@20c.; Western, dairy best 20@21c., other, 16 19c.; factory 14@18c. Old butter nominal at 22@23c.; fair to prime poor State and Western, 7@11c.; grease, 6@6½c.

Receipts for the week 16378 pkgs.
Exports past week 1940 pkgs.

COTTON has fluctuated only a trifle, having been very dull.

Latest prices are 10.85@10.90 for April, 10.92c. for May, 11@11.01c. for June; 11.07c. for July; 11.10@11; 11c. for August; 10.78@10.80c. for September; 10.59@10.60 for October; 10.48@10.50c. for November; 10.49@10.51c. for December; 10.57@10.59c. for January; 10.67@10.69 for February.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	7 15-16	7 15-16	8 1-16	8 1-16

Fair	12 7-16	12 7-16	12 9-16	12 9-16

Stained.

Good ordinary, 7 15-16c. Strict ordinary, 8 11-16c.; Low middling, 9 3-16c.; Middling, 9 13-16c.

CHEESE.—Exports for the week 13,700 boxes. The new cheese have been arriving moderately only and closely taken up, with about the opening prices sustained. It is presumed that with next week's supplies prices will scarcely be maintained.

For new 12½@13c. for best lots 11@12c. for good 9½@11c. for half skimmed, and 5½@7½c. for whole skimmed; old at 13@13½, for fancy; 12@12½c. for prime; 10½11½c. for good; 8@10c. for fair. Western factory good to prime, at 10@11c.; strictly fine, 12½c.; fair to good at 9@10c., and poor at 6@8c.

Liverpool cable, 63s. Gold closes 100¾.
Exports for the week, 13,583 boxes.
Receipts, 16,503 do.

DRIED FRUITS.—Apples of the higher grades have fair inquiries and rule strong in price but the common lots are dull and depressed. Peaches and small fruits generally are firm.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; unpeeled halves, 4½c.; quarters, 4c. Pitted cherries, choice new 23@25c.; Raspberries, 27c. New York State plums, 13@14.; southern plums, 11@12c. Apples —State quarters, old, 4¾@5½c.; do. sliced, prime, 6@7c.; Western quarters, 4@4½c.; Southern, at 6@7c. prime sliced, 5@5½c. for fair to good.; Southern quarters at 1½@4½c.; Tennessee quarters, in bags, at 2½@3½c.; prime fancy and North Carolina sliced at 8@12c; Blackberries 10½c. Exports for the week 700 bbls. apples believed to be mostly on owners' account.

EGGS.—Receipts for the week, 9,635 bbls. The week following Easter is apt to be a quiet one in the egg trade. Consumers become more or less cloyed during Lent, and spring table items are abundant and low enough, this season, to turn the current of trade into other channels. Hence, though receipts are falling off, prices are easy, without prospect of suddenly favoring sellers. Southern eggs are almost out of date. A few invoices of fine Canadian have appeared; not quoted above Western choice. Duck and goose weak with the close of the Easter feast.

New Jersey, 12@12 <c.; State and Penn., 10½@11c.; Western and Canadian, choice, 10@10½c.; Southern, in good order, 9½@10c.; inferior, 9c.; Duck, 16@17c.; Goose, 30@35c.

FEED.—Sales are at $17.50@18.50 for 40 lbs. and 60 lbs.; $18@19 for 80 lbs.; $19@20 for 100 lbs.; $18@19 for rye feed, and $20@21.50 for sharps.

FEATHERS.—Selling in a small way at 45@50c. for prime, and 40@42c. for mixed, which is better.

FLOUR.—There has been a more active business for export, and low grades are held firmly. The higher grades are plenty and easy in price.

Latest prices are $4.15@4.90 for poor to fancy superfine State; $5.00@5.20 for poor to good extra do; $5.20@5.60 for good to very choice do.; $4.15@4.90 for superfine, Indiana, Iowa, Michigan, Ohio, &c., (the latter in extreme); &c.; $4.90@5.20 for inferior to good shipping extra do., (mainly at $5.05@5.10 for lines); and $5.25@5.65 for good to choice extra do.; common to choice white wheat extras, $5.50@6.00; choice to fancy do. at $6.10@7.50; red and amber winter wheat, inferior to choice trade and family, at $5.30@6.50; round hoop Ohio at $5.00@5.35, and trade and family brands of do. at $5.50@6.75, the latter rate for very choice; St. Louis, $5.45@6.10 for very poor to good extra, and $6.10@7.25 for good to very choice (with a few brands of fancy quality quoted up to $7.25@7.50); Minnesota clear, very inferior to very choice at $5.10@6.10 (a few fancy brands selling as high as $6.15@6.25); Minnesota "straight," inferior to very choice, at $5.75@6.75 (few brands going above $6.35@6.50, and patent poor to fancy choice at $6.10@6.75; unsound stock at from $2.25@5.75; city mill extra at $5.20@6.25 for fair to very choice for West Indies; do. for England at $5.00@5.10; do. trade and family extras, $6.50@7.50; do. for South America, $6.40@7.35 for fair to fancy; No. 2 at $3.10@4.35 for inferior to very fancy.

CORN MEAL.—Brandywine quoted at $3.10@3.15, and Western yellow at $2.25@2.65.

FRESH FRUITS.—Apples are nearly out; quotations are merely made from regular customers for the remnant. Baldwins, $5@6; Russets, $4@5; poor, $3@4. Strawberries have been in light supply; Charleston prime, 30@40c., inferior to fair, 5@20c.; a few early Norfolk, 35@50c. Hot-house Black Hamburg grapes, $1.75@2.25 per lb. Cranberries are over with commercially. Peanuts continue dull. Handpicked, $1.35@1.40; fancy, $1.25@1.30; common to prime, 85c..@1.20.

GRAIN.—The English news has encouraged export operations, and with small receipts prices generally higher.

Sales of wheat are of ungraded spring at $1.20@1.33; New York No. 2 spring at $1.33; No. 1 Chicago spring in store $1.29; No. 1 Milwaukee and Minnesota spring at $1.33@1.34; red Western at $1.35@1.37½; amber Western, $1.40; ungraded white do. $1.13; New York No. 2 red at $1.37½@1.38; No. 1 red at $1.40; No. 1 white, at $1.41; extra white at $1.45; extra white to arrive by May 10 at $1.47; No. 2 Chicago spring, first half May, at $1.25; No. 2 Milwaukee spring, next weeks deliveries at 1.23; choice red State to arrive at $1.41; No. 2 northwest spring, May delivery at $1.26; New York No 2 spring, April delivery, at $1.27½@1.28; do. May, $1.24½@1.25; New York No 2 red, April, $1.38. Rye at 73@74c. for Western and 75@76c. for State. Corn—Latest sales are of New York No. 2 on the spot at 55½@56c.; New York No. 2 old at 57½c.; New York steamer mixed, 54@56c.; steamer yellow, 55½c.; ungraded mixed, 52@54½c.; No. 2 April delivery, 55½c.; No. 2 May delivery, 53½@53½c.; No. 2 June delivery, 54½c.; steamer mixed, April delivery, 55c; do., May delivery 51½c. Oats of New York No. 1 white, at 40½c.; New York No. 2 white, 36@36½c.; white State, 26@39c.; white Western, 35@39c.; mixed Western, 35@36½c.; New York No. 1 at 36½c.; New York No. 2 at 35½c.; No. 2 Chicago, May delivery at 35c.

HAY AND STRAW.—Receipts are higher and demand is very fair.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 35@45c. for short rye, and 35@45c. for oat.

Exports for past week 637bales; since Jan. 1st., 23,000 bales; same time last year 20,100 do.

HOPS.—Exports for the week have been only 185 bales. Trade is very dull, and prices are wholly nominal.

New Yorks, good to prime, 7@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

LEATHER.—Hemlock sole at 19½c. to 21c. for light, 19½ to 21 for middle, 20 to 21 for heavy and 17½@19 for good damaged.

MAPLE SUGAR.—The market does not warrant new supplies, and many of the prominent producing point have discontinued shipments this week. Prices from at 10@12c. for sugar, 75c.@100 per gallon for sirup including can.

OIL-CAKE.—Western quoted at $30@30.50 per ton.

PROVISIONS.—Hog products generally have been stronger in price with a more active export demand.

Mess pork, $9.75@10.00 for spot lots; $9.75 for April, and May, $9.85 for June and $9.95 for July. Bacon at 5½c. for long clear and 5¾c. for short clear. Lard—Western steam, 7.27½c. for spot, lots 7.25c. for May, and 7.35c. for June. Stearine, 7¾@7¾c. for prime and choice. Beef hams at $15.00@16.50 Beef—New extra mess, $12.@12.25; plain, $10@11.50; new packet $13.50@11.50 family mess, $15@16; extra India mess $25@26 for city brands; do. Philadelphia, $24.

POULTRY AND GAME.—Live poultry is in light supply and the advanced rates are strong for fowls. Ducks and geese have no special call. Spring chickens are quotable but in size are unattractively small.

Near point fowls, 12@13c.; Southern, 11c.; Western 12c.; Roosters, 6@8c.; Turkeys small but weighty, 12@14c.; other, 11@11½c.; Ducks, choice, 87c.@$1.12; other, 50@65c.; Geese, N. J., $1.25@1.50; other, 60c.@$1.

New Jersey and Pennsylvania dressed poultry combine most of the receipts, these are mainly contracted for at this season and city killers have almost the full market trade. Fine country dressed is strong.

Turkeys, prime, 16@17c.; good, 13@15c.; large 9@11c.; frozen, 16@17c. selected. Fowls are not extra in quality: fair to best, 11@13c.; other, 8@10c. Capons are lower, 28@30c.; slips, 25@27c.; Fancy Philadelphia chickens, 18@20c.; spring do., 30@35c.; winter, 23@25c.

Game is quiet with easy prices; the low rates for pigeons are higher than they have been as supplies have been large. Wild ducks out of market. Wild pigeons and squabs, 65@75 ₩ doz.; English snipe, $1.12@1.25.; Sand Snipe, 35@40c.; plover, 90c.@$1.

SEED.—Clover is quoted at 7¾@7¾c. for State and 7¾@7¾c. for Western; Timothy at $1.30 to $1.40.

SUGAR.—Refined at 9¾ for cut loaf, 9¾ for crushed, 9¾ for powdered, 9¾ for granulated, 8¾@9¼ for soft white and 7¾@8¼ for soft yellow.

TOBACCO.—Export demand has been fair and the local trade is improving with prices generally strong.

Iowa, Vermont and Illinois—34@36c. X and XX, 36@40 for No. 1, No. 2, 32@34c.; combing, 45@48.

Missouri, Kentucky, and Tennessee—Washed fleece, 35@41c.; unwashed, 26@28c.; unwashed combing, 28@32c.

LIVE STOCK MARKETS.

NEW YORK, April 27, 1878.

BEEVES.—Receipts for the week, 10,600 head: do., last week, 8,674 do. Average quality runs well. Receipts have weighed enough upon the market to weaken it, and prices are lower than at our last. Corn-fed Cherokees and Texas sold at 8¾@9¼c.; fat bulls, part stall-fed, 3½@4c.; medium to good native steers, 8¾@10c: selected, 10@10¾c. Trade in live for export steady.

COWS AND CALVES.—Receipts are moderate and the former ranges are still current: $35@40 for fair: $60@70 for really good to extra milkers.

VEAL CALVES.—Receipts for the week, at the yards, 3,870 head; do. last week, 2,624 do. The market has ruled weak without really being dull. Dealers think the decline is checked. The range for common to prime has been 1@6¼c. Buttermilk calves, 3½@5½c. Hog-dressed dominal: 5@6c. fair to good; poor, 3@4½c.

SHEEP AND LAMBS.—Receipts for the week, 18,517 head; do. last week, 17,887 do. Market firm at both Jersey City and 60th Street. Poor clipped sold at 3c. ₩ lb.: medium to fair sheared, 4½@5½c.; unshorn, 5½@6¼c. Lambs run fair in quality; quoted 6¾@9c.

SWINE.—Receipts for the week, 25,397 head; do. last week 29,718 do. The market at the close was a shade firmer. Ohio, 152 lbs., sold at 5¾c.; country-dressed, 4½@6c. for fat heavy to medium and their pigs.

Marsh's Cylinder Bed Foot Lathe.

PLEASURE FOR THE AMATEUR.

BUSINESS FOR THE MECHANIC.

This is a NEW LATHE, on a NEW PLAN, having a Cylinder Bed, which is much more simple and convenient than the old style. It has attachments for circular and scroll sawing and bracket moulding. **New, Novel,** and the **Best Invented.** Manufactured and sold by the BATTLE CREEK MACHINERY CO., BATTLE CREEK, MICH.

Send for Circular and Price List.

TRADE MARK. 'VIBRATOR' Reg. March 31, 1874.

THE ORIGINAL & ONLY GENUINE "Vibrator" Threshers,

WITH IMPROVED

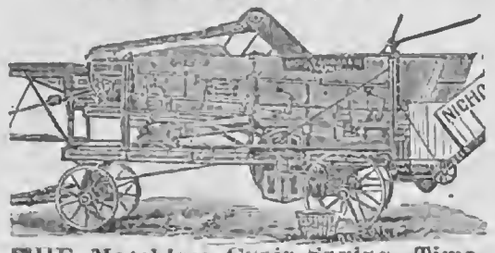
MOUNTED HORSE POWERS,

And Steam Thresher Engines,

Made only by

NICHOLS, SHEPARD & CO.,

BATTLE CREEK, MICH.



THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all Rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

GRAIN Raisers will not Submit to the enormous wastage of Grain & the inferior work done by the other machines, when once posted on the difference.

THE ENTIRE Threshing Expenses (and often 3 to 5 Times that amount) can be made by the Extra Grain SAVED by these Improved Machines.

NO Revolving Shafts Inside the Separator. Entirely free from Beaters, Pickers, Rubbers, and all such time-wasting and grain-wasting complications. Perfectly adapted to all Kinds and Conditions of Grain, Wet or Dry, Long or Short, Headed or Bound.

NOT only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than One-half the usual Belts and Gears. Makes no Litterings or Scatterings.

FOUR Sizes of Separators Made, ranging from Six to Twelve Horse Size, and two styles of Mounted Horse Powers to match.

STEAM Power Threshers a Specialty. A special size Separator made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, with Valuable Improvements and Distinctive Features, far beyond any other make or kind.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "Vibrator" Thresher Outfits are Incomparable.

FOR Particulars, call on our Dealers or write to us for Illustrated Circular, which We mail free.

Use the Anti-Friction Hay Carrier.

For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "J," to C. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

USE THE BUFFALO

HONEST FERTILIZER

Ammoniated Bone Super Phosphate,

AND

Pure Ground Bone.

To Preserve and Beautify Your Homes Use

GUTTA PERCHA PAINT.

THE BEST PRESERVATIVE EVER USED for Wood, Iron, Stone or Brick Structures, FOR INSIDE OR OUTSIDE WORK. Send for Sample Colors and Price lists (FREE) to GUTTA PERCHA PAINT COMPANY, 356 Euclid Ave., Cleveland, Ohio.

Halladay Standard.

The only Wind Mill awarded

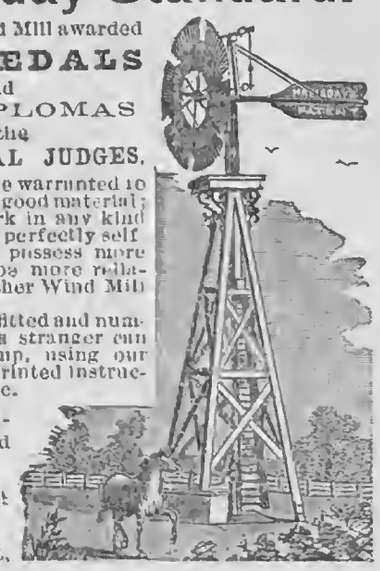
TWO MEDALS

and

TWO DIPLOMAS

by the

CENTENNIAL JUDGES.



Every machine warranted to be well made of good material; to do good work in any kind of wind; to be perfectly self regulating; to possess more power and to be more reliable than any other Wind Mill made.

Each piece is fitted and numbered so that a stranger can put the Mill up, using our drawings and printed instructions for a guide.

Send for Catalogue "B" and Price List.

U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

LADIES IF YOU WISH TO COLOR—

Use Leamon's Dyes.

Warranted the best and cheapest Dyes for all family and fancy dyeing. Dresses, Cloaks, Coats, Ribbons, Ties, Feathers, anything, can be colored any shade. Anyone can use them. The expense is trifling. We especially recommend the Black as much better than logwood. Sold by druggists, or any color sent by Mail, large size, 25c., small size 15c. Send for Dye Book and beautiful Samples, Free.

WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

THE HAIR is Rendered Soft and Pliable, and its vigorous growth promoted by the timely use of Dr. Jayne's Hair Tonic. Being a good dressing for the hair, and an excellent tonic for the scalp, any one threatened with baldness should give it a trial.

Reading for the Young.

OUR SCHOOL DAYS.

BY T. HAGAN.

CROWDED back, we look upon them
Past, yes past—forever gone—
Scenes of pleasure, hours of treasure,
Sweet to gaze and look upon;
Past, yes, like a fleeting moment,
Oft they constitute an age;
Budding forth from early childhood,
Soon we turn life's gayest page.

Mingling with our infant comrades
Life stamped naught upon our mind:
But when school-days dawned upon us,
Footprints then were left behind:
Traces of a new-born era
On the way by which we trod,
Like the plow which marks its furrow,
Leaves behind the upturned sod.

Thus do we in pensive silence
Wander thoughtfully through the field,
Gathering flowers of early childhood,
Fragrant with life's morning seal;
Straight, perhaps, our course has led us,
Sweetly smells each glowing flower,
Planted well and watered duly,
Index of a happy hour.

Not alone we find we've labor'd,
Many hands came to our aid;
Cheering words, like dews of heaven,
Gave a vigor not to fade.
Helping hands and toiling comrades
Made our interest all but one,
While our troubles, light and narrow,
Soon were lost in blithesome fun.

Pass'd we've now the span of boyhood,
With its memories flooding on,
As the bosom of a river
Ever bears its tide along.
Launched upon more rnffled waters
And beset thy greatest fear,
Swift our bark floats down the current,
And the verdant leaf grows sere.

Pause we then—yea, stop to wonder
How our happy school days sped;
Years rolled by and days long number'd
Would we could again but wed.
Thus we look upon life's morning,
Ushering in a noonday sun;
Veering round, it shrouded leaves us—
Thus the race of life is run.

DEEDS OF KINDNESS.

Sequel to "A Memorial."

BERTIE A. WINKLER.

IT was a sultry day in June when HARPER ARGOW, exhausted by the heat and fatigue of the long walk, seated himself on a log in the shady lane leading to the home of ASHLEY GREY. Pulling his hat over his eyes he wearily leaned his head on his crutch. Midday silence reigned; only at long intervals a harmless locust would break the stillness or a grasshopper disturb the languid air as, snapping his wings, he flew from stalk to stalk on his destructive errand.

In deep thought, he paid no heed to the youthful figure which approached on tiptoe, and only turned with a slight start as he felt his hat removed and the well-known face of ASHLEY GREY peering anxiously into his.

"Sick, HARPER, or asleep?" he asked, taking a seat beside him.

"Neither, ASHLEY," HARPER replied, cheerfully, "I was merely planning while I was resting."

"Just like you for all the world, ever busy with brain or hand. Some new game for the boys, eh?"

"Well, not exactly. I was just on my way to look for you—" he broke off abruptly, "Have you anything to do?"

"No. I'm just ready for some fun. Come tell me your plan," he urged as he saw HARPER hesitate.

"Well, ASHLEY, you know widow BROWN whose twenty acres join your father's woods? Mother sent me to her this morning, and when I asked her about the crop, she commenced to tell me of her troubles; how the only farm-hand she had was suddenly taken sick during haying, and being unable to hire others while the farmers were all so busy, she is in a bad way. Her hay is to be gotten in before the rain which I don't think is very far distant. "Suppose," here he continued the conversation in a whisper until his companion interrupted him with a loud "Bravo, HARPER! that will be capital fun for us. You ought to have the first prize as the inventor of——"

"Hush," said HARPER quickly, "let's go, keep your compliments until it's done."

Arrived, after a brisk walk, near Mrs. BROWN'S premises they concluded that ASHLEY should go ahead and see if the field was clear, in which case he would signal to HARPER. Silently ASHLEY crossed the stream and crept cautiously along the thick underbrush which answered for a fence about the orchard. Five minutes elapsed and no sign of his comrade, HARPER was growing impatient, when a low, prolonged whistle came across the fields, and HARPER hastened to join his friend who with a proud smile on his face, said, "Good news, HARPER, the house is closed, no one in sight. She has no doubt gone to get help. We must hurry or she'll catch us."

This said, ASHLEY crawled through the window of the stable and noiselessly opened the door to admit his comrade. To harness the horse and hitch him to a wagon was the work of a few minutes. Fortunately the lane was covered with soft green sward which effectually muffled the noise of wheels as they drove off, all the while casting furtive glances behind. Arrived on the hay-field they began work in earnest. Ashley conveying the bundles of hay to the wagon, while HARPER was busy with hands, feet, and crutch in loading.

They had cleared more than half the field when, pausing to rest, HARPER pointed to the western horizon where thick black clouds came rolling up. ASHLEY understood the mute language of his friend and with renewed vigor turned to his work. Neither spoke; every minute was precious, every muscle was strained to meet the emergency. Never did boys work harder, and never did HARPER regret the loss of his leg more than now, as with a frown of impatience he flung his crutch over the wagon.

The gale blew fiercer, the lightning flashed sharper, and the horse was growing restless. There was still a large patch of hay to be gathered.

"Oh, for some kind angel to hold back that tempest for a few moments longer," murmured ASHLEY, almost breaking beneath the heavy load he was reaching up to the wagon.

"Hello, boys! What are you doing here. Have you hired yourselves out?"

With a startled look, as though caught in some guilty act, they turned and faced the new-comer.

"Oh! GUY, you're just in time to do us a favor; come lend us a helping hand. I will tell you all about it when we're done," cried HARPER greatly relieved to see it was one of the boys.

"All right, ASHLEY, jump on the wagon, I will bring you the hay while HARPER holds the horse" laughed GUY as he reached his hand to HARPER to help him from the wagon.

The three soon finished their work, and when the horse was comfortable in his stable, hay safe under the shed, HARPER told GUY the whole affair: how they thought they would have some harmless fun, by quietly spiriting Mrs. BROWN'S hay from the field and lodging it under her shed, and him warned not to say a word about it to any one.

"Good! good!" laughed his companions. "That's one of the best tricks you ever played, HARPER. Won't she look, though, when she finds her hay high and dry! She'll begin to believe in spirits."

Suddenly HARPER started and exclaimed "Boys I've lost my watch!" All started in search of it, but after a long vain search on the field HARPER turned for home full of vexation and grief. The watch had been sent to him, when he was lying half dead with his shattered leg, by a strange lady who passed through the village on the train he saved from destruction. It was therefore priceless. After his companions were out of sight, HARPER seated himself on the same log where, in the beginning of the story, he had so hopefully planned a deed of kindness to a neighbor. "Is this my reward?" he murmured almost heart-broken; in spite of his efforts the big tears welled up to his eyes. He sat there until the sun was sinking in the west. He concluded at length to make another search for his lost treasure, when he was confronted by Mrs. BROWN'S flushed face.

"Ah! HARPER ARGOW you are just the one I want. It will save me the trouble of going to your house. "There," she said dropping a gold watch into his hand, "my help found it in the hay he was unloading, I knew it was yours the moment I saw it. I don't know how to thank you enough, though, for getting that hay in before the rain," she murmured as she laid her hand gently on his shoulder and, with eyes beaming with pleasure and gratitude added "your mother may well be proud of such a SON."

"It was'nt me altogether Mrs. BROWN," replied HARPER, his face beaming with joy at his recovered treasure, "ASHLEY GREY, and GUY FORBES did the main part of the work and——"

"Never mind. I known you well enough to know you must have been on the wagon loading it, for it was there your watch was found. I am going to have a grand party in your honor as soon as the busy season is over, will you come?" she asked.

"Yes, if you will invite *all* the boys" he said hesitatingly "Oh! certainly, *all* the girls too." she replied with a merry twinkle in her eye.

OUR INDUSTRY CLUB.

The Queen of the Darners!

IT is over! The prize was justly carried off by a little six-year-old maiden, Miss Elinor Baldwin, of Chula, Virginia.

Any little striped stocking ought to be proud of a pair of such dainty darns, and as for the mother of the little darner——well! we *think* she ought to be a happy woman.

Miss Flora Barton besieged a rent of mammoth proportions and wrought it more skillfully than work we have seen executed by young ladies with college diplomas in their bureau drawers. She is certainly entitled to the position of First Maid of Honor—and to a second prize.

It seems such a pity to abruptly close these pleasant relations that we have decided, with the Editor's permission, to establish an "Industry Club," that shall be permanent—*at least until it closes!*

We had in our mind, for future use, an offer for that class of persons too often overlooked—the boys. However, it does not seem exactly fair that they should wait while the girls are enjoying the benefit of their pets—for we have long since discovered that boys are quite as appreciative admirers of Flora's treasures as are the girls. So we make the following offer:

For the best specimen of fret-saw work (any small article), done by a boy of not over fourteen years, his choice of two dollars' worth of hardy plants from a very fine list which we will send.

The girls shall have an opportunity to compete for a plain-sewing prize. For the best specimen by a girl under ten years, her selection of four beautiful, hardy plants from our list.

After we have awarded the prizes, lists will be sent to the successful competitors.

These offers will close upon the 25th day of May.

ROSE GERANIUM,
Care RURAL NEW-YORKER.

GRANDMOTHER SPEAKS.

I DECLARE! I do not know what this world is coming to. So much extravagance! so much idleness, shiftlessness, thriftlessness and a universal good-for-nothingness! Talk about every generation growing wiser! The wisdom of the present generation is foolishness. Call it croaking, the querulousness of old age or what you please, I know that the girls now-a-days cannot hold a candle to the girls of fifty years ago. Now, how many hours in a day do young ladies sit perfectly idle, with folded hands? If a stranger calls, if a friend drops in for an hour, if they have gentleman-callers in the evening, they must sit still and entertain them. It is not fashionable to do anything; you must devote all the time to the particular entertainment of your company.

When I was in my girlhood, if company called I always had some nice needlework at hand, ready to catch up; and I embroidered yards and yards of nice edging and insertion, and made elegant collars and cuffs in just the very time the young ladies now do nothing at all. I know you can buy Hamburg embroidery so cheap that it does not pay to embroider; I have heard that till I am tired of it. It is not half as nice as that you could make yourself, and does not wear as well, either; and where is the money coming from to pay for Hamburg?

Money does not grow on bushes any more than it did when I was young. A penny saved is better than a penny earned, and if girls only knew how much prettier they look when they are busy than when sitting idle they would do something. It makes me sad to see girls try so hard to be graceful: first try one posture, then another; and if they only had some work in their hands they could be graceful and at ease. Then think of the hours that are lost. Time is money, or ought to be. How much they would give if they could only have a few of these very hours that they squandered away—doing nothing!

I tell you what, girls! I believe in being polite, in treating guests hospitably, and the best rule I ever saw for true politeness is to do to others as you would that they should do unto you. You will find this the best rule for etiquette, ever laid down; and no one would enjoy a call, or a visit, one whit less if you were employed while they were present, in some light work. You can converse just as well if your hands are busy, and sensible persons would be very apt to tarry longer if they saw they were not delaying your work than if you sit like a statue trying to be genteel and interesting. I should rather cut up paper and make lamp-lighters when I had calls, than to be idle. Don't you know the good Dr. WATTS said, "Satan finds mischief for idle hands to do?" and it is just as true as preaching.

No, I din't mean the new-fashioned preaching. I just mean gospel preaching; the preaching that tells us to be good, and we shall be happy. It is a strange pass that this world has come to, but let me tell you the religion that makes ourselves and our neighbors happy, that does good to all, is the genuine article. Those whom I would trust are the every-day Christians that *live* religion. I never had faith in Sunday Christians, any way. But I was telling about girls, not religion. You turned the switch, throwing me off the track. I suppose you don't like me to talk to you about being idle; but really, it makes me feel sad to see the young girls grow up in such a useless way. They don't consider how hard their mothers have had to work to take care of them from babyhood up to childhood, night and day.

But mothers or grandmothers won't last forever, and at the rate girls go on there will be a lack of hard work in the household. Sewing machines, will not patch, darn or do half the work nimble, well-trained fingers can do. I am not sure that the invention of sewing machines is a blessing. I think that girls are not as well off in our country to-day as they would have been if these things had never been made. They might have been well enough if they had not been made to pamper extravagance but, oh dear, when one thinks of the hosts of suits that girls have stitched their very lives away in ruffling, flouncing, and all the superfluousness that machines brought into fashion, the rattle of the thing has a melancholy, knell-like sound to my ears.

There, who has turned the switch this time? Well, I have gone so far off the track this time that I will not try to get back at present, but take another day to finish in. GRANDMOTHER.

DO EVERYTHING WELL.—If you have something to attend to, go about it coolly and thoughtfully, and do it just as well as you can. Do it as though it were the only thing you had ever to do in your life, and as if everything depended upon it; then your work will be well done, and it will afford you genuine satisfaction. Often much more does depend upon the manner in which things, seemingly trivial, are performed than one would suppose, or than it is possible to foresee. Do everything well, and you will find it conducive to your happiness, and that of those with whom you come in contact.

Sabbath Reading.

HOLY COMMUNION.

"As the living Father hath sent me, and I live by the Father; so he that eateth me, even he shall live by me."—ST. JOHN, vi. 57.

"Amen, Alleluja!"

WE sing the everlasting truth
Of words that Jesus said:
There is a holy human life
Upon the earth we tread.
It was poured out our faith to win,
It has prevailed against our sin,
It brings eternal glory in,
E'en here among the dead.

O Lord of all the angel host
And of the church above,
We know Thee in the midst of us
By thy descending dove.
When in our prison stained and dim,
With cherubim and seraphim,
Lift up to thee the heaven-born hymn
Of joy and praise, and love.

Hail, bread of God that men may take!—
His spirit teaches how,
The dying soul that eateth thee
Shall even live as thou.
"Come, eat," the faithful witness saith
To sinners breathing mortal breath,
"And live forever after death;
Yea, live forever now."

This being, with its ransomed powers,
Oh let that body feed,
And make the very life it lives
An endless life indeed.
With faith in thy anointing shod,
It chooses paths which thou has trod,
And offers to the living God
Its whole immortal need.

Soldiers and servants by thy grace,
But heirless children first,
We gather round or Father's board
In hunger and in thirst.
Bold through the love which thou has shown,
Rich without substance of our own,
We give thee, not our best alone,
But all our least and worst.

The treasure worthless in our hands
Transformed in thine we see.
Thou takest from us what we are,
How spoiled soe'er it be.
In thy participating name,
We pour our sorrows, tremblings, shame,
The empty hope, the failing aim;
And then we feast on thee.

It is for service that we live,
Destroyer of our sin.
It is to keep the children's place,
With all its discipline.
But sweet be our communion song,
The whole contented way along,
God gave us thee, and we are strong
For life to triumph in. [*Sunday Magazine.*

A TYPOGRAPHICAL CRIME.

IF one must be singled out and doomed never to receive decent typographical treatment, it should be any other rather than the Bible. I should like to see what would be the effect of giving it a fair chance. I believe it would be read if it were made readable. We ought to have one edition of it without marginal references and without footnotes—unless in the rare cases where these are absolutely necessary. Where the italicised words are necessary to a complete and idiomatic rendering they should be printed in plain Roman; where not thus necessary, they should be dropped. Instead of verses we should have paragraphs, and all figures or other indications of the verses abolished. Conversation should be printed in broken paragraphs, with quotation marks, just as in a novel. Poetry should be printed as poetry. Instead of being crowded into one volume, the book should be in four or five moderate duodecimo volumes, with large type and good paper, so that it could be at once held without tiring the arm and read without straining the eyes. Finally, this book should have a good analytical index, and does not serve the purpose of one. If presented in such a form, the Bible might be enjoyed as literature and perhaps better understood as a divine authority.—*Rossiter Johnson, in Sunday Afternoon for May.*

THE VALUE OF BEAUTY AND UTILITY.—Which is the more valuable, the cup-shaped blossom of the purpled convolvulus, or the ripened ear of corn?

Each has its value, and probably in value neither exceeds the other. We prize the flower, although its bravery lasts only a day, since every beautiful object delights the soul and is in truth a smile from God. And we likewise prize the ear of corn, which is also a thing of beauty, though of a humbler kind, for it has a mysterious power by which it sustains the strength of man, and fills his heart with joy.

THERE is no other name, no other nature, no other blood, no other merits, no other persons to be justified and saved by, but Jesus Christ. All the tears in the world cannot wipe off one sin, nor can all the grace and holiness that is in angels and men purchase the pardon of the least transgression. All remission is only by the blood of Jesus Christ.

GOD keeps an exact account of every penny that is laid out upon him and his, and that is laid out against him and his; and this in the last day men shall know and feel, though now they wink and will not understand.

PERSONAL ITEMS.

James Gordon Bennett is said to have made $60,000 on O'Leary's walking victory.

It is said that the Prince of Wales has none too much of the hair apparent about him.

Senator Cameron and Miss Sherman are to be married in Cleveland on the 9th of May.

Ex-Queen Isabella will sell in July in Paris a large proportion of her finest jewels, the value of which estimated at $2,500,000.

Henry Ward Beecher at sixty-five is very red in the face and puffy, and seems always in earnest, even when he walks. There is an idea, when you see him, that he is rushing, as if he might lose a train.

A brother of the late Vice President Wilson politely opens the door for visitors to the Senate chamber, and a brother of Senator Blaine, who only slightly resembles him, helps fold speeches, etc., in the document room.

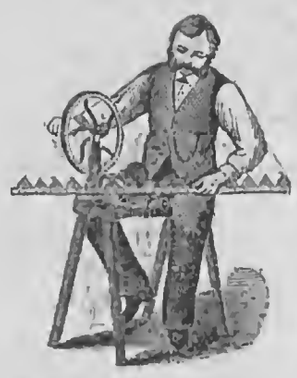
Senator McCreery does well for a humorist, because he is comical in appearance. His large head is completely bald, except a fringe of black hair to border it. He is tall and broad-shouldered, and always wears a swallow-tail coat. His face wears a solemn expression, that renders his jokes all the more surprising.

When Eugene Hale married Miss Chandler, Papa Zach. Chandler gave him $100,000 for a wedding present; and at the advent of every grandchild, a check for $20,000 is forthcoming, to be placed to the credit of the child as a nucleus of its future fortune. Babies are never unwelcome in that household.

Mrs. Charles Dickens has become reconciled to her sister, Miss Hogarth, who, after the separation of the novelist and his wife, acted as the former's housekeeper. The two sisters are now living together. It was of Miss Hogarth that Dickens said: "She was the truest and best friend man ever had."

Hon. Montgomery Blair resides in one of the most elegant mansions in Washington, directly opposite the Executive park and the magnificent State, War and Navy departments. He has a country residence in Montgomery county, Maryland, and thus secures a seat in the Legislature. He has a charming family, and an invitation to a *soiree* at the Blair Mansion is considered the acme of social superiority.

Implements and Machinery.



LIVINGSTON & CO.'S
SICKLE
GRINDERS.

Price $10.

Every owner of a Mowing Machine should have one.

They pay for themselves in a single season.

N. B.—The first 500 machines will be sold at $7.50 each.

☞ Order early.

Send for Descriptive Circulars. Agents wanted.

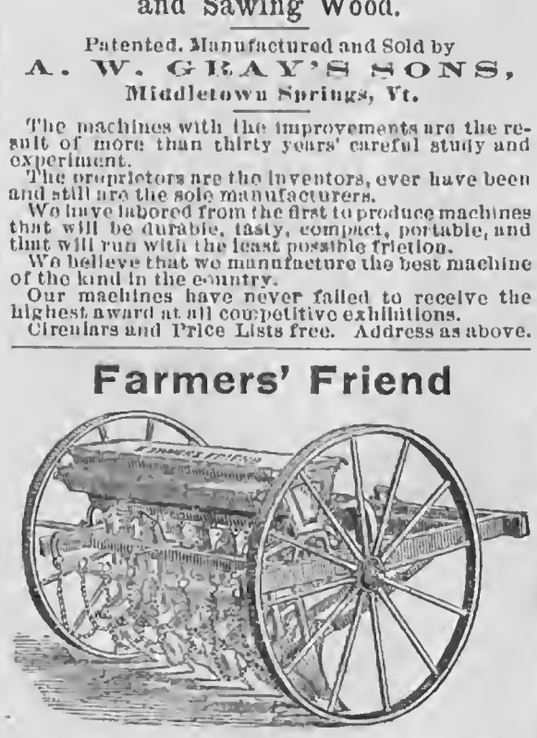
MACHINES FOR
Threshing and Cleaning Grain
and Sawing Wood.

Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.
The proprietors are the inventors, ever have been and still are the sole manufacturers.
We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.
We believe that we manufacture the best machine of the kind in the country.
Our machines have never failed to receive the highest award at all competitive exhibitions.
Circulars and Price Lists free. Address as above.

Farmers' Friend



Grain & Fertilizer Drill.

The quantity is regulated with gear-wheels in a CONE, so there are no loose wheels or movable feeders, and it will sow any grain perfectly and accurately.

It has the best Spring Hoe, and every Drill has a Force-Feed Grass-Seeder, Patent Shifter, and Surveyor free.

Illustrated Catalogues, with description, prices, and a Full Centennial Report, sent on application. Agents wanted in unoccupied territory. Address, stating where you saw this notice,

FARMERS' FRIEND MF'G CO.,
Dayton, Ohio.

SPARKS AND SPLINTERS.

A BRIGHT boy wants to know if by eating dates enough he will become an almanac.

A HANDKERCHIEF flirtation is a very simple affair. It only requires two fools and two handkerchiefs.

"I SAY," said a rough fellow to a fop with conspicuous bow-legs—"I say, don't you have to have your pantaloons cut with a circular saw?"

No wonder a ship is called "she." She has shifts, stays, an apron, hooks and eyes, pins, caps and ribbons, hoods, poppets, and a husband.

KANSAS teacher: "Where does all your grain produce go to?" Boy: "It goes into the hopper." Teacher. "Hopper? What hopper?" Boy, (triumphantly): "Grasshopper."

"GENTLEMEN, I introduce to you my friend, who isn't as stupid as he appears to be." Introduced friend, with vivacity: "That's precisely the difference between my friend and myself."

REV. JOSEPH COOK said that "Darwin's hypothesis of pangenesis involves several untenable subsidiary hypotheses." Very few people supposed it was as bad as that.

A VACUUM would be the best place for a fellow to fall into, wouldn't it Bill? for then, you know, he wouldn't fall against anything." "Yes, he would, though," stoutly answered Bill; "he would fall against his inclination."

Two wealthy wood carvers in Massachusetts have founded a home for destitute members of the craft. Why don't some of our wealthy poets found a home for destitute poets? This could be done by roofing in one or two continents.—*Danbury News.*

A BOSTON girl fell while dancing on New Year's night and broke her arm.—Exchange. Her brother should have taken her partner out and schottisch head off.—Harrisburg Telegraph. We have red ow a better way than that, but less fatal. Hit him on the head a few time s with a polka.—Norristown Herald. This would doubtless have the effect of putting a quadrillateral head on the poor fellow.—Oil City Derrick. Waltz the matter with your fellows? Such puns are enough to make the strongest man in Virginia reel.—Fulton Times.

A Suggestion to the Traveling Public.

Tourists, emigrants and mariners find that Hostetter's Stomach Bitters is a medicinal safeguard against unhealthful influences, upon which they can implicitly rely, since it prevents the effects of vitiated atmosphere, unaccustomed or unwholesome diet, bad water or other conditions unfavorable to health. On long voyages, or journeys in latitudes adjacent to the equator, it is especially useful as a preventive of the febrile complaints and disorders of the stomach, liver and bowels, which are apt to attack natives of the temperate zones sojourning or traveling in such regions, and it is an excellent protection against the influence of extreme cold, sudden changes of temperature, exposure to damp or extreme fatigue. It not only prevents intermittent and remittent fever, and other diseases of a malarial type, but eradicates them, a fact which has been notorious for years past in North and South America, Mexico, the West Indies, Australia and other countries.

NOT QUITE THE SAME THING.

SMALL CHILD (whose favorite Aunt is "engaged.") "Grandma, where is Auntie May?"
GRANDMAMMA.—"She is sitting in the Library with Captain Herbert, my dear."
SMALL CHILD (after a moment's thought.)—"Grandma, couldn't *you* go and sit in the Library with Captain Herbert, and Auntie May come and play with me?"

To OUR READERS.

WE beg to announce that the RURAL NEW-YORKER issue of May 11th, 1878, and thereafter will be enlarged to the extent of four columns. This will be in effect the same as issuing a four-page supplement every four weeks. In other words by lengthening and widening the columns we shall give our readers what is equivalent to seventeen of our present pages.

This change which involves considerable expense, we submit, is in accord with our reiterated statement that we should by every means in our power respond to the gratifying appreciation which has been extended to the present management of the RURAL NEW-YORKER.

We take some pride in the fact that no other family paper in this or any other country has, during the past eight months, placed before its readers, in its several departments, a higher class of writings, and offer this as an earnest of what may be counted upon for the rest of the year.

The price of the RURAL NEW-YORKER will remain, at least for the present, the same as heretofore.

Entomological.

CARRION BEETLES.

NATURE'S means of protecting one portion of her children while providing for another portion, are illustrated excellently in the workings of scavenger insects. The rapid dissolntion which follows the death of the bodies of animals would fill the atmosphere with noxions gases, were this dissolution to take place solely under the influence of the elements. By the intervention of insects the dead remains of animals are converted quickly into living tissues, and that part of the animal creation which would otherwise suffer from a tainted atmosphere is providentially delivered from annoyance and danger.

The accompanying figure represents some of these scavenger insects at their beneficent work The principal insects which are represented as attacking the mole, belong to four families of beetles and one family of flies. If we take up these families one by one, we may get a clear idea of the several parts which they play in the order of nature.

The Short-winged beetles, called Staphylinidæ in the books, are easily recognized by the character which gives them their name. Two large ones and one smaller one are figured near the middle of the body of the mole, others are represented on the grass and flowers in the lower part of the figure. More than four thousand species are known. Most of them live on the ground in companies, nnder decaying matters, many of them in manure, in carrion, in woody fungi and quickly-perishing mushrooms, or under the bark of trees, under stones, or in sandy places; a few live in the colonies of ants and others upon flowers.

The "Carrion beetles" which are by the best rights entitled to monopolize their name, are called Silphidæ by the naturalists, and like other beetles here represented, have the tips of their six feet developed into five joints. The antennæ, those wonderful organs of touch, taste, smell, hearing and perhaps social intercourse, are usually eleven-jointed and thickened gradually towards the tip, but sometimes they end in an abrupt knob. The hip-joints of the front and middle legs of the Silphidæ are conical, projecting freely from their sockets, and the rings of the belly are six in number and freely movable; by these characters the Silphidæ are distinguished from all the rest of the five-toed beetles which have clubbed antennæ. They are all found abont the carcases of animals, either eating them or laying their eggs upon them, and have a bad odor. If choice food is lacking, they eat decaying vegetable matter, each other, or other living insects. They have a very acute sense of smell, and are attracted from great distances by the odor of decaying bodies. Four hundred and sixty species are known in the world, and a large proportion of these occur in North America. The two principal genera of this family are called Necrophorus, or the burying beetles, and Silpha or the special "Carrion beetles." In the figure the lowest insect at the left hand is a Necrophorus; the one next to the right of the left hand, a fly; the similar one nearly above it, and the other similar one higher up in the same direction are Silphas. So also is the larger one, resting on the ground near the Necrophorns.

The larvæ of the Silphas feed upon carcases as they lie, but are sometimes so nnmerous that their usual food does not occur in sufficient qnantities; then hey have been known to do considerable damage to turnips by eating the young leaves. In some regions, where sugar-beets are raised in great qnantities, the larvæ have been fonnd on the young plants in broad daylight in such quantities as to make the plants look black, althongh usually the larvæ remain hidden.

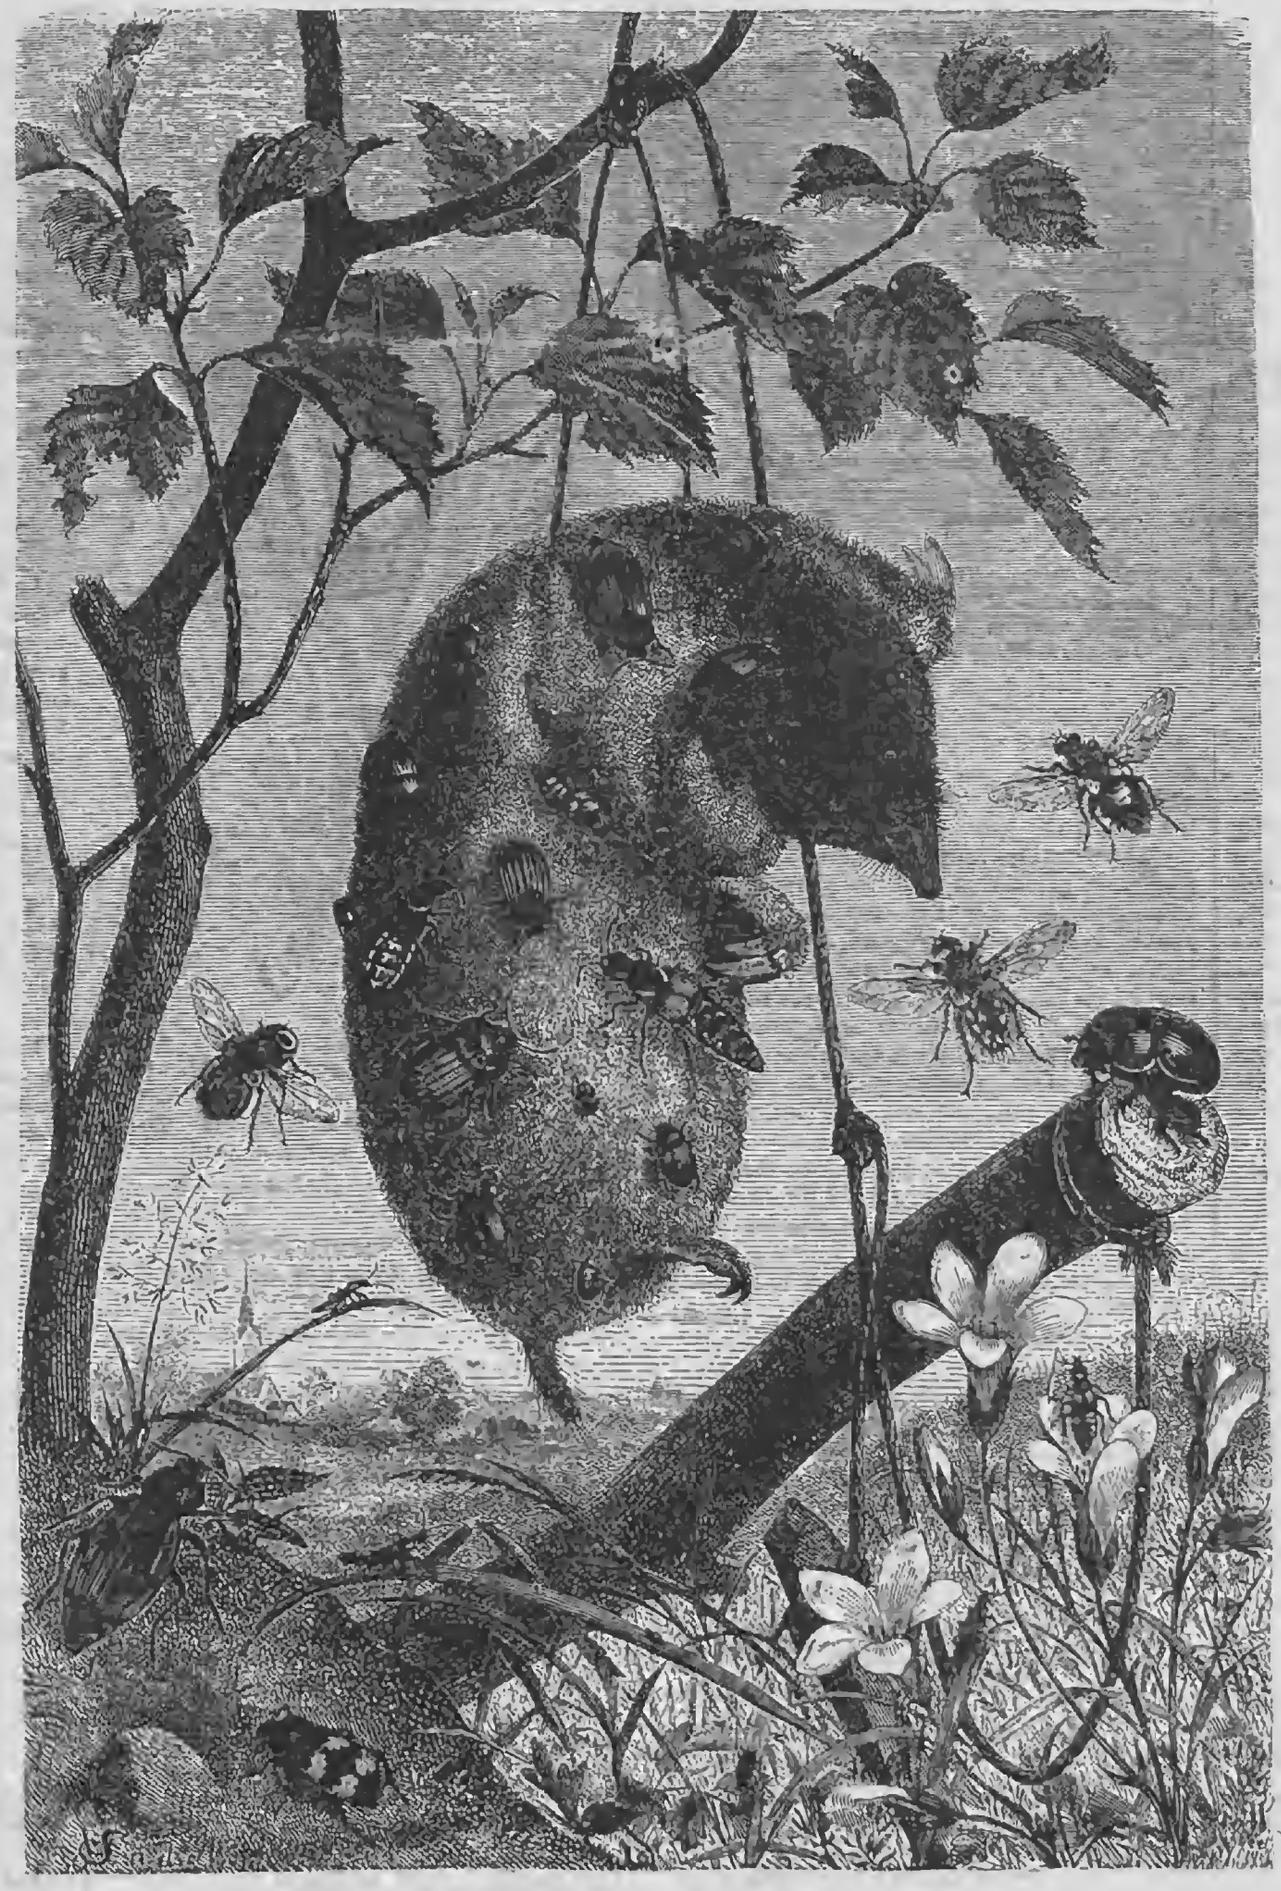
The third family of beetles which are represented as attacking the mole is that of the Histeridae. To this family belong the beetle near the tail of the mole, just below the lowest Silpha, and the two similar beetles on the back of the mole. These beetles are very compact and hard, and, when frightened, draw the head and legs so close to the body as to seem destitute of limbs. They feed on decaying vegetable or animal matter, in manure, in fleshy fungi, under bark or in ants' hills. On account of the very small size of their months they can only feed upon liquid food. Eleven hundred and fifty species are known.

The fourth family of beetles is that of the Scarabæidæ, or the Leaf-horn beetles, so called because the club of the antennæ has the form of three or four leaves laid face to face together. To this family belong the beetle highest up on the neck of the mole, the one just above the hind leg and the one on the end of the stick. About six thousand five hundred and fifty species are known, and these have very unlike habits. The ones figured usually feed upon and lay their eggs in manure, but content themselves at times with the flesh of carcases.

The flies which are figured are different kinds of blow-flies, whose maggots consume decaying flesh.

Hornets do not disdain to eat the flesh of newly-killed animals, nor bntterflies to drink the juices of animals, even when they are far gone in putrefaction.

By their united labors the insects make quick disposition of wasting organisms and make room for the growing ones to develop in their stead.



CARRION BEETLES.

Farm Economy.

ARTIFICIAL MANURES.

A Letter from J. B. Lawes, of Rothamsted, England.

DEAR SIR:—You ask for some hints upon the subject of artificial manures, to aid your farmers who are about to experiment largely with them.

Assnming that these experiments have for their object to ascertain whether artificial manures can be profitably nsed, I do not think there can be mnch doubt in regard to the snbstances which should be employed. I am often told that the experiments carried on here have but little valne beyond the boundaries of the farm. I see no reason for such restrictions. An English pig fattens perfectly well upon maize grown in the States, and your home-grown pigs would doubtless fatten upon English-grown barley. Why? Because both contain the same chemical ingredients, although in slightly different proportion. The food of a cereal crop cannot differ, in whatever part of the world it may be grown. Until experiments prove I am in error, I shall certainly assume that the soils in the United States are more likely to be benefited by nitrogen in some active form, such as nitrate of soda, salts of ammonia, than by any other snbstance, and after that by phosphoric acid in some solnble form.

The United States is essentially a grain-producing conntry, and the statistics show that cereal crops occupy 77 acres ont of every 100. For reasons which I have explained in several papers, land under constant grain crops is exhausted more rapidly of its nitrogen than of mineral constituents, such as potash and phosphoric acid. While, therefore, I should be disposed to say that experiments should be tried with nitrogen in some active form, alone, and in combination with solnble phosphate of lime, and that in all probability one or both these manures will supply all the requirements of the crops, I do not pretend to give any opinion in regard to the profit which would be derived from the use of these manures, as I know nothing in regard to the cost of them, or the value of the products grown. I will, however, point out how this question of the profit attending the nse of artificial manures should be considered. Our cereal crops (straw and grain together), as we harvest them, contain about one per cent. of nitrogen, and as nitrogen is by far the most costly element in purchased manures, the profit or loss from its use will depend more than anything else upon the amount which can be recovered in the crop. To give a plain illustration of my meaning, I will take the case of an application of 100 lbs. of sulphate of ammonia to an acre of maize. Maize is so low in nitrogen, compared with the other cereal crops, that probably 100 lbs. of the total crop would contain less than one per cent. of nitrogen; but calling it one per cent., 100 lbs. of sulphate of ammonia ought to increase the crop by 2,000 lbs., as sulphate of ammonia ought to contain 20 lbs. of nitrogen. On an average of seasons the increase obtained will certainly be less than this.

In my experiments where grain crops

are grown continuously, and receive the same amount of nitrogen every year, I do not recover more than one-half the quantity of nitrogen in the produce, and I generally obtain a better result where I use nitrate of soda as the source of the nitrogen. If experiments are tried with nitrate of soda in comparison with sulphate of ammonia, the proportion of the two substances supplying equal amounts to the soil, should be 80 lbs. sulphate of ammonia to 100 lbs. nitrate of soda. In 1847, or a little more than thirty years ago, I directed attention to the question of recovery of nitrogen, and to make it plain, I said that it required five pounds of ammonia to add one bushel increase to a crop of wheat. Although the farmers of this country have used artificial manures continuously ever since the time I name, they have never grasped the idea, nor does the question of increase in relation to the supply of nitrogen in the manure, ever become the subject of discussion amongst them.

Whenever the agriculture of a country demands a more concentrated produce than the soil can furnish from its own resources, the supply of nitrogen in manure and its recovery in crops, assume an importance superior to all other questions relating to manures. Both as a question of science and economy the subject is equally interesting, and should your agriculturists view it in the same light as I do, they will hardly allow thirty years to pass without attempting to measure growth by the amount of force supplied to the crop.

SOMETHING ABOUT GOOD TOOLS AND A GOOD TEAM.

PROFESSOR W. J. BEAL.

For a beginner it is better not to buy a very large assortment of tools at the outset. His expenses are likely to be large and he may not know exactly what he wants. Of this he may be certain that poor tools are not economical. Remember that a day's work of a man is often worth a dollar or a dollar and a half, while a good hoe can be bought for half that amount. Labor that is performed with a dull, rusty hoe that is loose on the handle, will cost more than that performed with a nice new implement. It is economy to throw away poor tools and buy good ones. To some extent the same is true of a team. It takes as much time of the driver to care for and drive a poor team as it does a good one, while the cost of feeding each may be about equal. The wages of a driver will cost about as much as the wages of a team of two good horses. Why waste a half or a third or even a quarter of the labor of a valuable man in setting him to work with a cheap, light or inferior team?

A good handy *fast-walking* team is more economical at a high price than a team which walks slow or which is awkward or of poor quality. A poor tool or a poor team is always dear at any price and is one of the signs of mismanagement and poverty. An implement should be as light as is consistent with strength. There is a great satisfaction in handling excellent tools. It is well to be a little shy of patent high-priced implements of all kinds, unless you have plenty of money to spare.

The thrifty man, on garden or farm, will take care of the tools and the team. He will paint the former, oil them, clean them, and house them. The careless man will leave them in the open air, scattered about the premises where they were last used, or he will leave them along the road or in the lane, or in front of his barn or dwelling-house. We can nearly always judge of a farmer's care, and generally of his success, by seeing his tools and how he takes care of them. Many men are heavy-fisted and twist and pry and break or soon spoil nearly every implement they lay their hands on. They are proud of displaying their strength. They are very unlucky. Others, or the best of hands, take hold of tools with care and use them properly. Such men are handy, lucky (?) and profitable to employ. To which class will each of my young readers strive to belong: the handy and expert or the clumsey and slow? These remarks will apply to men everywhere, in all trades, in every business or even in the professions.

The gardener or farmer will need a few carpenter tools. It will be very fortunate for him, if he has had some instruction and practice in the use of such tools and in keeping them in good repair. Other things being equal, the natural mechanic will have much the advantage over the one who has no tact in using tools. Mechanical ingenuity is a priceless gift, but those who have not this gift can learn to do much better than they usually do. Some of the most profitable and interesting work I ever performed was in planning and in making suitable places for all of my tools and implements. When of suitable size and shape, an implement always looks better when standing up or hanging up. For small tools, a sort of cupboard, four feet wide eight feet high and twelve or eighteen inches deep, is convenient. Two doors swing open in opposite directions. A narrow strip, up and down the center of the front, will hold the doors closed when desired. Such a case will hold a surprisingly large number of tools. They may be hung on the inside of the doors on convenient blocks or pins made for the purpose. On each side of the inside of the case I have made small pockets for an assortment of nails, screws, bolts, rivets, wire, gimlets, cold-chisels, twine, a vice, small rope, and numerous other small articles which cost but little and are often needed in cases of an emergency. A person will save much time and perplexity by thus being a little fore-handed. In saving perplexity, he enjoys life the better, makes money faster and will probably live the longer.

A small slate or shingle should hang near, on which should be noted down at the time whenever any article gives out. This may be consulted each time before going to town and the supply should then be replenished. The proprietor can thus save much time and be saved many journeys to town in going for small articles without which it is impossible to proceed in his work. After a little it will be a good thing to have an extra plow, hoe, rake, spade, fork, saw, hatchet etc., in cases of an emergency. Often half the value—yet, the full value of an implement—may be saved by having it on hand in case of breaking something or in case of wanting to employ more help. It is not always economy to use the fewest number of tools possible.

The Garden.

THE FARMER'S GARDEN

In times gone by and even now too frequently the farmer's garden was a quarter acre, more or less, of land inclosed by a fence, and where well cultivated, it contributed largely to the health and comfort of the family as well as to the prosperity of the farmer himself. But these little gardens are expensive luxuries, requiring a large outlay of severe, back-aching work. Where land is so plentiful, as on most farms, the model garden will be so arranged that all crops can be cultivated by horse-power and some one of the many improved implements adapted to the work.

Where necessary to inclose the garden, leave, for turning a border of grass, about twelve feet wide, on all the four sides. Plant no trees on this border, for unless an ample space is occupied they will soon cast a shade over a large share of the area. Plant in rows running the whole length and far enough apart to allow a horse to pass. These must be regulated according to the varieties planted and the training of the horse. I remember working successfully a well-trained horse attached to a common cultivator of one tooth among carrots only fifteen inches between rows, thereby saving time and hard labor. I sometimes plant double rows of onions, lettuce, etc., that is, every second space is just wide enough to admit of using a hoe while the others are wide enough for horse cultivation.

I have found fall plowing beneficial, especially on heavy lands. When the earth is thrown up in rough ridges it gives the frost a better chance to operate on the soil during winter. On the arrival of spring, when soil and weather are propitious, then let the cultivation commence.

Begin at one side with long rows of the early kinds which, when large enough to be seen, can be safely worked with a light cultivator, using common harrow teeth as being cheap and effective, in lieu of something better and more costly. As often as you work that portion already planted, go over the whole, thus destroying a vast number of weeds and preparing, for the later plantings, such a fine seed-bed as will push the vegetables to their best growth and require much less labor than where the weeds are allowed to riot until planting time. Then, again, as the early crops are removed and no second crop is to follow, give that portion a thorough fall fallowing. Some advise planting the coarser vegetables in the field with the corn; but as is often the case, since the cornfield is a half mile or more away, the overburdened house-wife will find the walk rather too much on a hot morning when the butter must be worked and the bread watched in the oven; hence it is quite likely the good man would find but few vegetables on his table after they were grown. I plant my beets, beans, peas, onions, potatoes and everything else that can be grown in that way, in hills instead of drills and find a great saving of labor, especially hand-weeding. I admit that a larger crop may be grown by close planting, but yet I grow vegetables by my plan at a less cost, and moreover the "no time" excuse for a poor garden will not apply in this case, as a half-hour's work per week during the season for each member of any farmer's family, will produce an abundance of the usual vegetables.

M. B. Prince.

TAKING NOTES AND MAKING PLANS FOR THE GARDEN.

PROFESSOR W. J. BEAL.

Where several varieties of one or more species are raised, they should be accurately labeled. Do not trust to memory for a single day. You may be ill or called away from home or wish to entrust the harvesting of the crops to new persons.

Nice suitable labels can be bought much cheaper than they can be made by hand. To prevent errors by loss or misplacing of labels, a small plan of the grounds should be made. Even a rude pencil sketch which is not mathematically drawn to a scale, may often save confusion. On the plan, record the name, relative position of the plants and number or number of rows of each, their length etc. This will aid in making accurate experiments.

These simple notes, requiring but little time, will also often serve a useful purpose in arranging for a rotation of crops in succeeding years, and serve to aid in planting the right amount of each variety and in determining the proper time to plant it.

To aid in keeping the sorts pure and unmixed, samples of plants, like strawberries, raspberries or any other thing which is likely to spread, should be planted in squares or blocks with considerable space between them; or still better, separate the varieties which look alike by a plot of some other crop. The nearer any two kinds look alike, the greater the need of leaving a broad space between them or of planting unlike things between them. Small seeds of new plants and all seeds which start slowly should always be sown in rows or drills, never broad-cast. This will aid in early weeding.

The careful gardener will take notes of his successes and failures; the merits and demerits of this and that variety; the proper time of sowing ripening etc. These notes will be taken every few days in the field, not trusting to memory. He will thus preserve and make use of all his good ideas. They will be impressed on his mind.

The plans should be well studied and worked over during the early part of winter. Most people never have a definite plan of operations, but shift often and work in many ways to a great disadvantage. Every person can accomplish more with less labor and consequently with greater profit by working to some plan. In case of an emergency, he is the better prepared to change with intelligence, success, and little loss of time.

Agricultural College, Lansing, Michigan

OKRA, OR GUMBO.

The seeds of Okra may be treated the same as coffee and answer very well as a substitute. It is usually cultivated for its fruits, however, which when green are cut up and used as a flavoring for soups. Sometimes they are used pickled, the same as capers.

Okra (Hibiscus esculentus) is a half-hardy annual, needing a rich soil and a warm, sheltered situation. The seeds should be sown in drills a foot apart and the drills three feet apart. There are several varieties, of which that known as "Improved Dwarf" is as good as any. The cut shows the leaf and fruit.

CULTIVATION AND USE OF OKRA.

Okra is grown here extensively, though not in as large quantities as most other sorts of vegetables. It is very productive and of easy culture, so that almost any family that possesses only a small garden, raises a few plants to draw its own supply from. It would not pay the professional gardener therefore to devote much labor and space to its growth.

At corn-planting time, about half-a-dozen or so seeds are dropped in hills, from three to four feet apart, in properly prepared ground. When about four inches high, the plants are all thinned out to one, kept hoed and clear of weeds. Any ground of medium fertility suits it, provided it is not too much shaded. In order to keep the plants bearing through the whole season, the pods ought never be allowed to harden or form seeds. There are two varieties of it, the long-podded tall, and the short-podded dwarf sorts. The latter is generally preferred.

Okra is used in soups; it is also stewed and served like asparagus or salsify. French cooks make a sort of dish—called gumbo—by conglomerating a variety of vegetables, herbs and spices; the chief ingredient of it being okra. The ripe seeds are sometimes used as a substitute for coffee. Parched and ground, they are sometimes given in the last stage of yellow fever, it being the popular belief that they are a specific against the black-vomit. Okra stalks, treated like bass-wood bark, yield a tough fiber which is not unfrequently used by market gardeners for the purpose of tying their vegetable bunches. Okra as an aliment is considered wholesome.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Old places are always interesting, but an old farm-house and grounds which have been in the hands of thrifty owners, are especially so. We love to hear the children say, "Grandfather planted that tree; that bush was a favorite of grandmother; father raised that tree, and mother set out that shrub." Old homesteads should have hallowed associations. They should link us with the past in life, and the future in death. Here our ancestors lived, and from here they went, waiting for us to follow. The very air is to us not like other air, but filled with memories so tender, and the rustling of the leaves, and the murmurs of the branches overhead and all around, are so suggestive and so full of memories that it is all sacred. We must teach our children to have more respect and veneration for age. Let them guard carefully what our fathers planted, and have a jealous care for the things they loved.

How welcome spring is to the animals! They look over the barn-yard fences as one would look out of a prison, and long for the green grass. Instinct tells them it is the very medicine they want to clear their systems of fever, to purify the blood, and renew all the functions of life. Get them out as soon as possible, and at night feed a little hay so that the change may not be too sudden. We had a cow abort once by turning her abruptly out to pasture. Sheep will not eat much hay after they go out to grass, but they will eat oats, and this will keep up their strength. The first grass, or rather the young grass, is weak, immature, and stock need something with it or it will make them too loose; generally there is more or less old, dry grass mixed with the new to act as an antidote or check, but this is not always the case, and then they should have some dry fodder; straw is better than nothing.

We turned the sheep out into a lot we are going to sow with oats, and as it was surrounded by a stone wall they have got into a way of climbing over it. To-day they have been put into the regular sheep pasture. If this experiment of keeping them a few days, or trying to, in the oat lot results in making them unruly, we shall regret it. Last year they did not get out once, because the field was fitted for them. It is a poor practice to let stock of any kind run out in the spring before the fences are fixed, and then they should be put into the lot intended for them and kept there without changing, as long as possible. This is one objection to changing pastures, as it is apt to make stock uneasy and breachy. We have taken up dividing fences and made the fields larger so stock could range longer without being moved from one lot to another. With a large range a poor fence will keep animals, while in a small field the fence must be higher and stronger.

The pet lambs are growing finely, showing that instinct was, and is, a better guide than old notions. They have got too big now to eat through a rubber nipple and have been taught to drink. What a stubborn instinct that is which makes a lamb, or colt, or calf, look up to find food when first born, and how hard it is to make them look down and drink! These lambs have grown as fast as the best ones in the field. What rollicking fellows they are!

Old Jack sprained his ankle two months ago. Bottles of liniment and gargling oil were applied. He was used a little, but it made him lame, and so, finally, he was condemned to the hospital and another horse put in his place. We made up our mind that rest was the best medicine for sprains, so his water was carried to him and he was not taken out of the stall for a month. Meanwhile nothing was put on. He simply stood still or lay down as he liked. The swelling went down, and now he is out to grass and does not limp at all. He is going to have another month of rest to give the muscles time to recover their natural tone and strength, and then old Jack will be himself again. By the way, he is twenty-four years old this spring and a veteran of the late war.

We sigh every day for rye straw. It is so nice and clean for bedding the little pigs and calves. Oat straw gets so broken up by the

machines and it is dusty and wets up so quickly. Rye straw would be clean and would last five times as long for a bed as oat, and then the pigs would be so much cleaner. The old hogs have all had to be scrubbed with soap-suds. It did them good. No animal will thrive when dirty. It took the man a half of a day to scrub the hogs, and it was time well spent. He put a slipping-noose on their upper jaws and tied them up, and with a scrubbing-brush get the dirt off and made them look really handsome. When tied up he put rings in their noses and now they are ready to go out to pasture as soon as the grass gets a little larger. A rainy day is a good time to wash the hogs, and the cattle too. Use warm water and rub them quite dry so that they will not get cold.

Veterinary.

MALIGNANT ANTHRAX.

I wish to inquire if any of the readers of your excellent paper can give a cure for or preventive of black leg in cattle. I have just lost three good yearlings. When first taken they were a little lame in one hind leg; the hip soon swells and feels spongy. They died in twelve or twenty-four hours after first noticing them. Examination shews the leg and side very dark and bloody. (All were in good condition.) In former times I have lost six in about the same way.

Wright Co., Iowa. O. E. French.

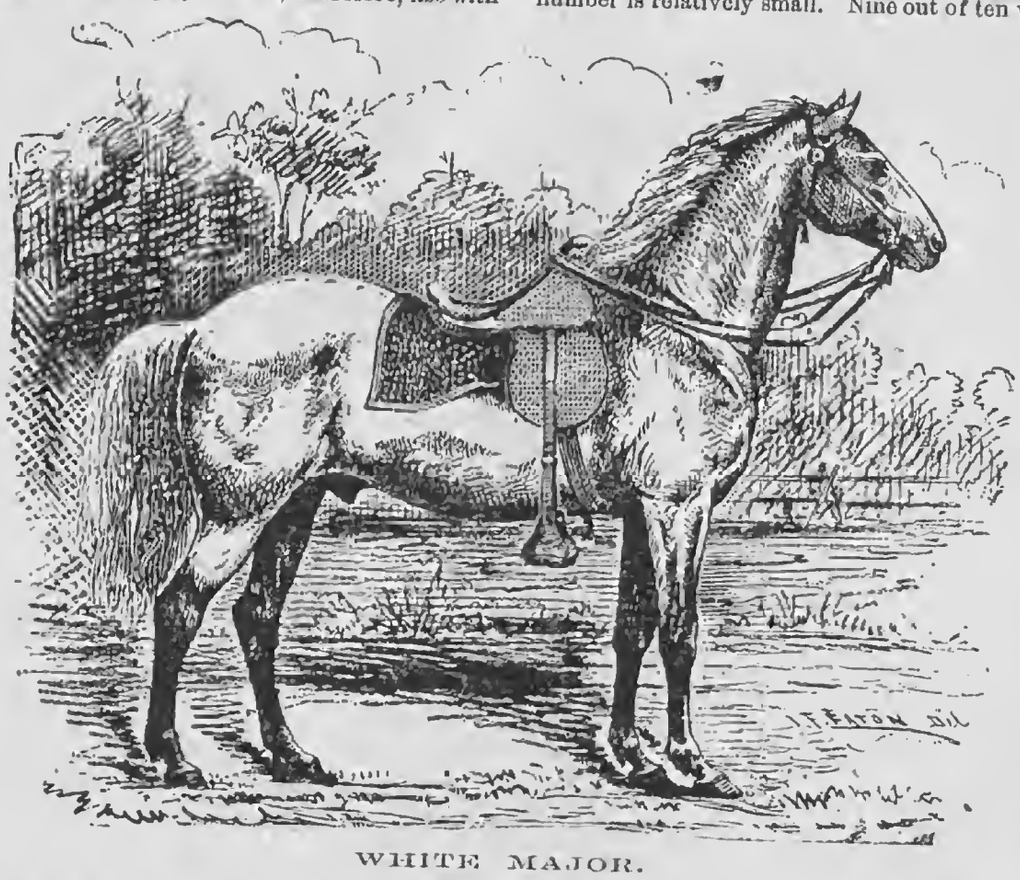
ANSWER BY D. E. SALMON, D. V. M.

Black leg is one form of the disease known as malignant anthrax or charbon; and as there are so many inquiries in regard to the different varieties of this trouble at this time of year, I will give such particulars as are necessary to an understanding of its nature. Anthrax is a disease of the blood and belongs to that class of maladies known as contagious fevers. Whatever the form of the disease, there are certain peculiarities by which it may be known; the chief of these is the condition of the blood, which has a black, tarry, viscous aspect, becomes red but slowly by contact with the air, does not coagulate, or at best coagulates but imperfectly; the globules are broken down or dissolved so that it leaves a dark, peculiar stain on tissues with which it comes in contact, or even passes through the walls of the vessels, causing large black patches of flesh (extravasations). In addition, the blood contains certain microscopic bodies known as bacteria, which have been considered as peculiar to the disease, and by some as its direct cause; there have lately been some experiments made in Germany which tend to confirm this latter supposition. But, even if such experiments should prove conclusive, they are far from having the importance that has been ascribed to them. We know, for instance, that bacteria develop in blood from healthy animals, which is allowed to decompose in contact with the air; consequently, such spores must be continually floating in the air, and as all animals are not affected with anthrax, it shows that there must be a certain condition of the system, caused by the food or surroundings, which assists the development of the disease. And of this we were equally certain before these experiments were made. In this disease the spleen, liver and lymphatic glands are enlarged, the mucous membranes are often a dark red color, there is a great tendency to decomposition, which makes the animals very offensive, even before death; there is also formation of gases in the tissues, which causes the crackling sound when handled.

In some cases we find only the changes in the blood and internal organs—this is *anthrax without localization;* in other cases there are swellings on the limbs, tongue and different parts of the body—this form is called *anthrax with external swellings*, and is commonly known, according to the point attacked, as *black-tongue, black-quarter, black-leg*, etc. In all these cases the disease is essentially the same; there are the same condition of the blood and the same contagious properties. And here is an important point that every one should remember: it is now well established that anthrax may be communicated from any animal to any other one, or to man; contact with the blood, saliva, excretions, etc., is sufficient, especially if these touch a sore or abraded surface.

This disease is much more liable to develop on certain farms than on others; and low, wet soils, without drainage, are looked upon with reason as causes of the disease. As prevention, therefore, drain such soils, or keep animals from such pastures; see that they are supplied with pure water, and have healthy surroundings and food. See that animals dying from the disease are deeply buried, with their litter and manure; that the places where they have been are thoroughly disinfected; and be sure that dogs, pigs or other animals are unable to get to their bodies to eat them and thus spread the disease. Keep sick animals at a distance from healthy ones; if you value your own health or life, cauterize all raw sores, no matter how small, on the hands and face, with lunar-caustic; be careful not to get blood or saliva on you, if possible to avoid it; wash well with soap and water in which a small quantity of carbolic acid has been dissolved, both before and after you go around such animals.

When the disease first appears there is usually little opportunity for treatment, as the animals die in twenty-four to forty-eight hours; later, when the disease is less rapid in its course, there is more hope of success. First, act upon the bowels with Glauber salts, then use mineral acids, antiseptics, tonics and stimulants. Remember that acids corrode the flesh, destroy clothing, etc., with which they come in contact before being largely diluted; therefore, use with great care. Dr. Law's treatment, to which I called attention lately in answering an inquiry of this kind, has been the most successful of any, and every farmer should have his book on the diseases of animals. I will give a modified form of this treatment, which may be used by any one with the precautions against contracting the disease which I have mentioned. For cattle, give morning and night a drench composed of sixty drops nitro-muriatic acid, three grains bichromate of potassa, and two drachms chlorate of potassa dissolved in two quarts of water; and at noon give a drench composed of thirty grains of sulphate of quinine, one drachm iodide of potassium and two drachms of bisulphite of soda in a pint of water. If chinoidine can be obtained it may be substituted in double the dose for the quinine as it is much cheaper; in case bisulphite of soda cannot be obtained, use the sulphite or hyposulphite; if one of these is not to be had, give the other ingredients as directed. In case the animals show signs of weakness and sink rapidly, give every hour a solution of camphor in sweet spirits of niter, made by dissolving an ounce of gum camphor in eight ounces of liter and dividing into four doses; each dose should be mixed with a pint of water before giving.



WHITE MAJOR.

DOCTORING ANIMALS.

D. E. SALMON, D. V. M.

Is there any reason why the principles and practices recognized in the treatment of disease in people should not apply to the treatment of sick animals? Each is made up of the same apparatus, organs and tissues; by microscope or chemical analysis of similar tissues of the bodies, we find cells in the one case that are almost identical, and in the other, a resemblance so close as to preclude any attempt of the chemist to distinguish between them. Going farther, we find each affected by the same local disease; that both people and animals have inflammation of the lungs, stomach, bowels, heart, of the mucous and serous membranes, and indeed, of almost every organ which goes to make up their bodies. There is a difference in the frequency of certain diseases, but this depends rather on the use to which the affected organs are put than on any essential difference between them. Thus, people are more subject to diseases of the nervous system, because that is more highly developed than with animals; horses are oftenest affected by diseases of the locomotive, digestive and respiratory apparatus, and cattle by those of the digestive and milk-producing organs and those in sympathy with them, because in each case such organs are most used. Coming to the contagious diseases, there is more difference; still a large number of them are intercommunicable; as, for instance, glanders, anthrax, hydrophobia, trichina, cow-pox and epizootic aptha.

Admitting this similarity, no one can fail to see that it must be as difficult to recognize the diseases of animals as those of people, in some cases even more so, because of the depth at which the affected organs are seated, and of the lack of ability to communicate the feelings. Again it is not difficult to understand that the treatment of similar diseases must be based on similar principles, and that this treatment, with animals as with men, must be varied to suit individual peculiarities, or the peculiarities or complications of the disease. In other words it requires the same knowledge of the structure and uses of the different organs, and the modifications to which they are subject, to recognize a disease with animals as with man, and to treat it, requires the same knowledge of the properties and effects of remedies in the one case as in the other.

But how many stock-owners are there who recognize these facts? I am sorry to say their number is relatively small. Nine out of ten will say when a horse is sick, "Mr. ——, has been brought up in a stable, has always been with horses and he ought to know what to do if any one." But what nonsense this is! Haven't we all been brought up among people, associated with them when sick and well, talked with them about their feelings, nursed them when sick, and, after all, what do we know about their diseases or the proper remedies to use, unless we have made the subject one of special study? And how can it be supposed that a stable-man is going to learn more about horses!

Then, there is another class of people who depend on their agricultural paper for prescriptions for all the troubles affecting their stock. No matter how good a veterinarian may be within call, he is utterly ignored, and a letter dispatched to the paper for information, which is duly supplied in the course of a few weeks. In case the animal does not recover the doctor may be called; but then it is usually too late for profitable treatment, or the disease has been aggravated by improper remedies. And if the doctor gives a different opinion from that furnished by the paper, as he often is obliged to do, he is denounced as an ignoramus and his services dispensed with—for has not the paper said otherwise, and can a paper be wrong!

Now, I want to ask if every step in this proceeding is not just as ridiculous as to suppose that a man brought up among people or in a stable should necessarily understand the diseases of his associates, or the actions and uses of medicines? Every observing man knows that there are many cases in which a physician is put to his wits' end to diagnose a disease, when he has the patient under his eye and can make the most careful examination. And who would write to the most skillful physician, and expect him to treat an obscure disease without seeing the patient and having only the most general description of his condition? The thing in most cases is utterly absurd, but no more so than it is to expect a man to prescribe for similar diseases, under similar conditions, with animals.

The symptoms generally given by inquirers are those which might arise from a dozen diseases, and to answer with certainty is impossible. I seldom take up a paper with a column of such inquiries and answers, without seeing one or more where the advice will obviously do more harm than good; in some cases the recommendation, if carried out, would ruin the animal; in other cases it would require a large and useless expense. In these cases the writer has made a plain mistake in diagnosing the disease, or has prescribed improper treatment. But this system often brings disaster from other causes. The dose of medicine should be graduated according to the size, age and temperament of the animal, and data for this are seldom given; the time required to get an answer often makes it useless when received; very few farmers understand the nature of medicines and are liable to injure themselves or their animals by improper precautions with poisonous and caustic agents which in many cases must be used; and, finally, animals are frequently injured and *very often* killed by want of care in giving medicine. It requires understanding and experience to give medicine safely to horses, and many people pour it into the air-passages oftener than into the stomach.

Taking all these things into consideration, it is incomparably safer and cheaper to employ a veterinarian at professional pay than to accept advice through a paper, though it cost nothing. Of course, much general information in regard to the nature, causes, symptoms and treatment of diseases can be obtained from agricultural papers, and the publishers of these deserve the greatest praise for their efforts to disseminate such knowledge; but a person ignorant of the subject attempting to apply this to individual cases will, excepting diseases of little gravity, fail oftener than he succeeds. It is safe to say that the more our farmers know about the diseases of animals, the more will they desire and appreciate the services of competent veterinarians.

And, just here, there is one more very important point to which I wish to call attention. The millions of capital invested in live-stock make it a matter of importance that our country should have enough educated veterinarians to supply every part of it; and can it be expected that this profession will increase to such an extent while its members are treated as an inferior order of beings; while quacks and ignoramuses are systematically given the preference; and while treatment prescribed in a newspaper is more relied upon than the judgment of a practitioner who sees the animal? No; when there is a demand there will be a supply, but not before. At present, there is little inducement for a young man to enter this profession, which should be as lucrative and honorable as any, though the practice is more laborious and less pleasant than some others.

The profession needs national and State recognition; it needs laws for the protection of its members; it needs a national veterinary school; but more than all, it needs that encouragement and appreciation which the farmers and stock-owners alone can give. When it gets this, nothing can prevent its growth and prosperity; while this is lacking, its members will be few, and the great mass of farmers will be unable to avail themselves of its assistance.

Buncombe Co., N. C.

The Horseman.

"WHITE MAJOR"

We have had "White Major" engraved as an excellent illustration of the sprightliness, vigor and beauty which may distinguish a horse to an advanced age provided he receives kind and judicious treatment. The animal belongs to our friend and correspondent Mrs. M. G. Rand, of Lyons, Iowa. As to his pedigree: He is half Morgan and half St. Lawrence. He was "born and bred" on a farm in Schuyler Co., N. Y. where he was kept until nearly seven years old. He was bought for a carriage horse about fourteen years ago. "Major" is now, therefore, in his twenty-first year, but he does not act or look half that age. His picture is pretty good, though he is much more beautiful than is here represented. He is gay and spirited, but easily managed and is a noble specimen of what a horse can be, under kind and gentle treatment. His health is so perfect that he is at all times full of vigor; never having a dull day. Once in two or three years, his shoes are taken off, and he is allowed to run in pasture for a few weeks in autumn. "Major's" eyes are large and bright, the nostrils finely formed; and on the whole his face has an amiable, and very intelligent expression. When a colt, his hind legs were slightly dapple-gray, but he soon lost that, and for years has been everywhere known as "White Major." He is noted for the pure white of his coat, mane, and tail, the only color about him, being on the extreme end of the nose, which is a beautiful pale slate or drab.

In regard to feeding: Oats and hay of the best quality only, are ever put before him, and at regular hours. His breakfast hour is 6. A. M. and the currying process begins as soon as the bedding is removed and his stall swept. The stable is always clean and well ventilated. Each stall has a good window that opens at the top, with wire grating inside to protect the glass, and awnings outside to protect the horse's eyes from the sun. "Major" is never driven hard, therefore never over-heated: but even if a little warm after exercise, he is not fed for an hour, and not watered until one hour or two after feeding. An open bridle is generally used on account of his apparent dislike to blinders; and then it is a pleasure to have his beautiful eyes in sight. He travels well alone or with another horse. By many people the Morgan horses are said to be naturally inclined to lameness, but such is not the case with "White Major," though pains are always taken to have him properly shod.

In view of the beauty of form so eminently possessed by the horse, his grateful appreciation of kindness and the valuable services he is constantly throughout life rendering to man, surely he deserves much higher consideration and much better treatment than generally falls to his lot. If our conduct towards him were regulated by the value of the services he has rendered to us, this noble animal would be a pet throughout the land, and so far as he was concerned, Mr. Bergh's society would have no cause for existence.

Hygienic Information.

PNEUMONIA.

DR. GOODENOUGH.

PNEUMONIA, peripneumonia, or lung fever, is an inflammation of the spongy substance of the lungs. There are numerous varieties of the disease, founded on the different portions of the lungs, or the different constituents of the portions, that may be inflamed; on the relation of the disease to other diseases with which it may be associated, and upon the character of the accompanying fever, or the state of the system. Pneumonia is called lobular, when small, isolated parts of the lungs are affected, which is common n children; double, when the inflammation involves both lungs; vesicular, when it affects only the air-cells; inter-vesicular, when its seat is in the cellular tissue intervening between the air-vesicles; pleuro-pneumonia, when large portions of the pleura are affected; typhoid, when associated with a low or typhons condition of the system; bilious, when complicated with disorders of the bile; primary, when it is the only ailment; secondary, when it is a sequence or accompaniment of other maladies; acute, when it is of short duration; chronic, when it is of long continuance; and lobar or croupous pneumonia, when a considerable extent of the lungs continuously is affected, embracing a whole lobe or a large portion thereof, or even the whole lung. This is the common form of the disease, and the one usually meant by the simple term, pneumonia. It is to a brief description of this that the present article is necessarily circumscribed.

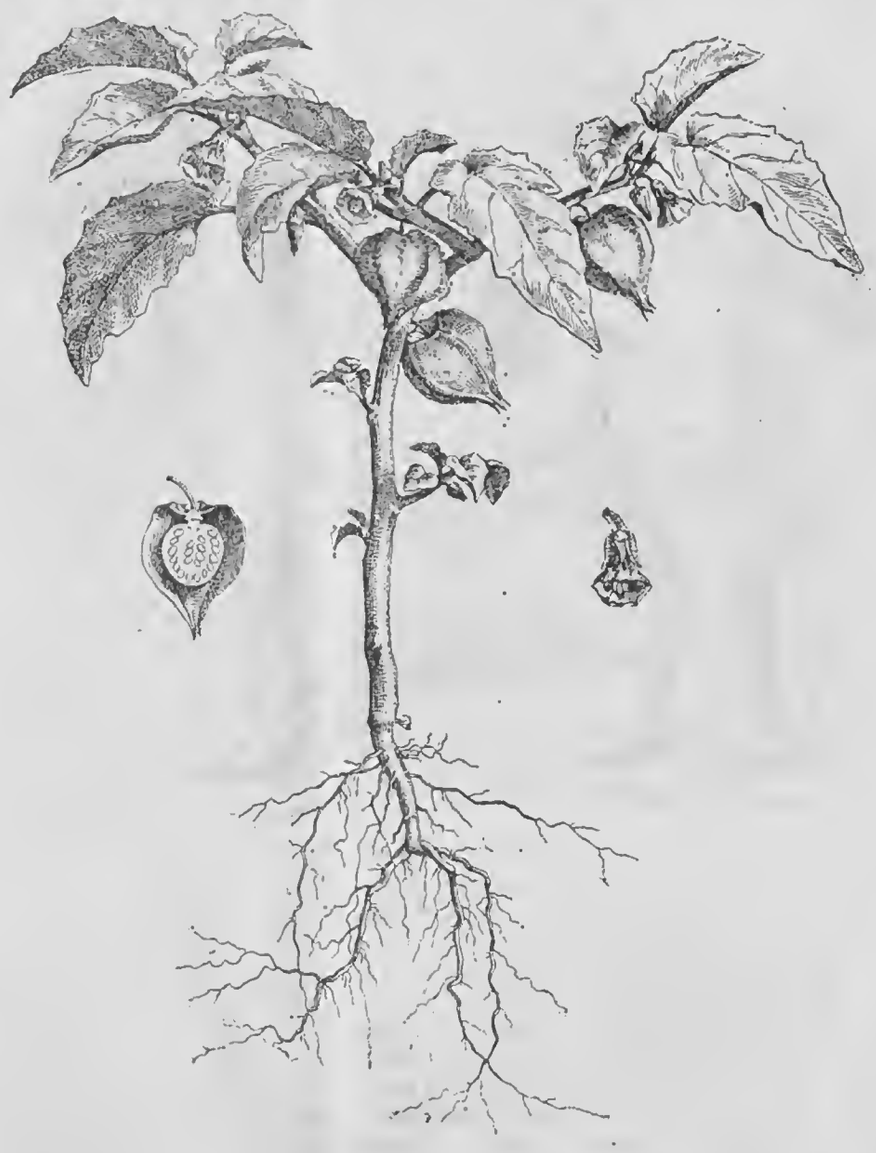
Pneumonia is one of the most frequent forms of inflammation, and carefully compiled statistics show that, next to consumption, it is the most dangerous enemy to human life. On an average three per cent of all ailments that afflict humanity, and 6-4 per cent of all those of an internal nature, are due to this disease, while of the total motality from all causes 6-6 per cent, and of that from internal maladies 12-7 per cent are the result of this scourge; and in these percentages cases of so-called secondary pneumonia are not included. It occurs in all latitudes and does not seem to be more frequent in one latitude or climate than in another. The widest differences in mortality from it are found in places very near each other and possessing the same climate; while statistics show the same ratios in localities widely separated and whose climatic conditions are entirely dissimilar. About two-thirds of all cases occur in winter and spring, and only one-third in summer and fall. Tables of mortality lately compiled for London, Paris, Vienna, Berlin, Stockholm, and several other large European cities, show that for an insular climate the maximum of deaths occurs from December to February; the minimum from July to August; while for a continental climate, the maximum mortality is from March to May; the minimum from September to November.

Owing to its numerous complications, and the differences in the number of these included by various cities under the head of pneumonia, in their statistical compilations, it is at present impossible to ascertain with satisfactory accuracy the average proportion of deaths to attacks of this disease; but from a careful comparison of the different tables of mortality a fair approximate estimate can be made. While to a vigorous child, the malady is not dangerous, feeble children rapidly succumb to it, and the bulk of the 10 per cent, who fall victims to it under the age of 10 years belong to this weakly class. From 10 to 20 the rate of mortality falls, the ratio amounting hardly to six per cent. From 20 onwards, there is a gradual increase in the proportion of deaths to cases until old age comes on, when this increase becomes rapid. Contrary to the general opinion, pneumonia is not dangerous to a man in vigorous health, provided his physical powers are unimpaired by excessive labor or exercise, or by immoderate use of alcoholic drink. From 20 to 30, the average ratio of deaths to attacks is only about nine per cent.; from 30 to 40, say 11 per cent.; from 40 to 50 about 15 per cent.; from 50 to 60, it jumps up to 24 per cent., and after 60, half those who are attacked die in Paris, and elsewhere a very large proportion. As an instance of the great differences in the compiled ratios of mortality in different places—while the average proportion of deaths to cases, at all ages, amounts to 24 per cent. in Vienna, it is only 13.83 per cent. in Stockholm.

Although it is often impossible to assign any cause for this malady, rapid changes in the daily temperature are certainly productive of it. Those who lead mostly an out-door life suffer less from it than those who are sheltered within doors. Women are somewhat less liable to it than men, but among them the ratio of deaths to cases is considerably greater—in proportion of three to two. One attack predisposes to another. Among the recognized exciting causes are: prolonged exposure to cold; a sudden chilling of the body when warm and perspiring; intemperance; violent exertion or emotion; over-crowding in ill-ventilated apartments; poisonous exhalations; and physical injuries to the lungs. In its secondary form it is also a frequent accompaniment of bronchitis, measles, whooping-cough, consumption, small-pox, scarlatina, erysipelas, and it is probably most common between 20 and 35.

There is no disease that presents so great a variety of aspects as pneumonia, the only features always present being a change in the lungs, manifest to the physician by percussion and auscultation; and an increase in the frequency of the respiration in comparison with that of the pulse. The ordinary relation of four pulsations to one respiration is disturbed, and the breathing becomes disproportionately quicker until, in very severe cases, it is sometimes as rapid as the pulse. In upwards of one-half the cases a chill, lasting seldom more than four or five hours, is the initial symptom. Then follow quickly difficulty of breathing, pain in the side or back of the chest, and a short cough attended with severe pain in the side, but generally at first, with no expectoration; headache, vertigo, heaviness in all the limbs. Soon the face becomes flushed, the muscles of the nose often begin to twitch, the cheeks assume a purplish tinge and the countenance an anxious expression; the cough grows interrupted, hoarse and harsh; the pulse increases in frequency; the patient is tormented with an intense thirst, and within a few hours the disease has already reached its hight. At other times, for several days before the actual invasion of the disease, the patient feels unwell and chilly or feverish; then the affliction is ushered in by one or more fits of shivering and the usual symptoms. Or, the chill may be absent and the scene opens with convulsions and complete loss of consciousness. Or, again, a frequent initial symptom is vomiting, either before or with a chill, especially in the case of children, and generally this is repeated. If there is a chill the illness may be dated from that point; and in its absence, from the moment at which the patient, having previously been in good health, can fix with certainty that the change commenced. Usually for the first 24 hours at least, the signs are uncertain, but if the patient has had the chill and has a pain in the side, rusty expectoration and a high fever there can be little doubt but that he is suffering from pneumonia.

The course of this disease is usually marked by fever with the temperature of the body varying from 104 to 106, falling from 2 to 2½ degrees in the morning and rising as much in the evening. The pulse varies from 100 to 110, and is generally still higher in children; the respiration is from 30 to 50 per minute, and sometimes as high as 80: headache, vertigo, exhaustion, thirst, difficulty of breathing, pain in the side. This pain is not indicative of the seat of the disease, but is caused by an accompanying inflammation of the pleura: the lung is comparatively insensible. The pain is sometimes absent, though not often, as Grisolle found it present in 272 patients out of 301. The skin at first dry, usually becomes moist about the third day, at least temporarily. The expectoration at first mucuous, then slightly purulent, becomes more and more bloody until the ensanguined streaks extend over the entire expectorated mass: its color is reddish-brown; quantity always small: it is mixed with air-bubles and clings tenaciously to the vessel that contains it. The urine is less, dark-colored, heavy and on cooling deposits a brick-dust sediment; in three-fourths of the cases the bowels are constipated; the tongue is generally moist and coated with a white or yellowish-white fur, sometimes clammy, dry, red or cracked. Generally towards the close of the first week, an abatement of the symptoms takes place; the pulse becomes softer, and slightly irregular; the cheeks less congested; the perspiration more profuse, especially on the forehead; but the temperature does not fall, nor does the patient feel any improvement. Within from four to 16 hours, the temperature becomes normal, the pulse and respiration diminish in frequency, and all the symptoms abate. At the same time the whole surface of the body breaks out into a warm, free perspiration; a deep, continous sleep follows, and on waking, the patient feels comfortable, relishes his food, and convalescence commences, and in course of usually about a fortnight, all local signs have disappeared and health has fully returned. If the attack terminates without any marked crisis, the restoration of health is more gradual, there are occasional temporary relapses, and convalescence can scarcely be said to begin until towards the middle or end of the second week.



PHYSALIS VISCOSA.

Death takes place sometimes within a few days, with intense heat, severe cerebral symptoms, convulsions, and delirium. Usually, however, it occurs from exhaustion of the heart towards the end of the first week. Then the deep red color of the cheeks becomes more and more bluish and at last takes a deep yellowish tinge, the patient falls into a low delirium, talking little and moving his hands. He understands what is said, but answers in a low, indistinct tone. The skin becomes insensible to pain; the breathing gasping, coarse and loud; the sufferer can swallow nothing; anon, the respiration grows feeble, interrupted by pauses, longer and longer; the pulse can no more be felt; the tip of the nose first grows cold; then the extremities, and death closes the scene, generally a couple of hours after the commencement of the crisis. Occasionally the patient rises suddenly in bed, gasps, and falls back a corpse. In elderly persons the struggle is generally brief, and the end a collapse.

Of course, all these symptoms are manifested in only very few cases, while many of them, together with others not here enumerated, are seen in every instance.

Out of 721 cases mentioned in a recent Vienna statistical report, 279, or 38.7 per cent, terminated on even days, and 442, or 61.3 per cent on odd days, the fifth and seventh days being the two most critical, 120 of the cases terminating on the former and 165 on the latter. Among the even days the eighth was the most decisive, 86 cases having terminated on it. According to the figures therein given, the ratio between the even and odd days is as two to three, and the most critical period is from the fifth to the eighth day, though the cases terminating each day dwindled gradually down to only one out of the 721 on the nineteenth day.

The favorable signs are: moderate fever, temperature not above 104° F. in the morning hours; spontaneous remissions; regular, full pulse; not averaging above 110; respiration not very frequent, ratio to pulse one to three; deep respiration possible without much pain; no continued paroxysm of cough; expectoration entirely absent or only moderate in amount; rusty-brown, not changing in color; and eruptions on the face. The latter come on usually from the second to the fifth day, and are decidedly a favorable symptom. Of 182 cases of pneumonia marked by facial eruptions, only 17, or 9.3 per cent, died; of 239 cases without eruptions, 70, or 29.3 per cent, died. Of these 421 cases, 159 were over 30 years old. Of these, 50 had eruptions and 10, or 20 per cent, died; 109 had no eruptions, and 58, or 53.3, died. The unfavorable symptoms are the reverse of these, and also profuse sweating with high temperature and markedly livid checks; a yellowish white appearance at the angles of the mouth; and, in females, pregnancy.

There are few diseases in which special treatment adapted to individual cases, is more important than in pneumonia; for the measures that would be salutary in one case, would be injurious, or even fatal, in another. In the belief, therefore, that such general directions as could be given in the limited scope of this article, would be likely to do quite as much harm as good, the few remaining remarks shall refer to the office of nurse rather than to that of doctor: The patient should lie with his shoulders somewhat elevated. In protracted and debilitated cases, his position should be changed occasionally in order to prevent the settling of the blood in any part of the lungs. Care should be taken to expose the chest and body as little as possible. The air of the sick-room should be of a uniform temperature, and warm, yet purified by sufficient ventilation. In early stages, what little diet the patient can take, should be farinaceous drinks, such as gum-water, barley-water, thin gruel to which may be added a decoction of ripe fruit or the juice of oranges or fresh grapes, the indigestable portion being carefully rejected. As the fever abates, give tea with toasted bread or crackers or a little rice; then, Indian mush, milk, broths, lighter meats, eggs, oysters. In this as in other diseases, nature powerfully aids a sound constitution, and with good nursing, little medical treatment will very often suffice.

Horticultural.

PHYSALIS.

BOTANISTS differ as to the species of Ground Cherry. Physalis Alkekengi, the strawberry tomato, is by Gray said to bear a bright red berry.; Others say that the berry is of a greenish-yellow others that it is yellow; others that it is of an orange color.

Physalis viscosa—see engraving—is common in dry fields and road-sides, both here and in Canada. This is also called P. heterophylla, P. nyctaginea, P. viscido-pubescens, P. Pennsylvanica, P. tomentosa. Physalis Pennsylvanica is also called P. lanceolata and P. maritima, while Gray makes P. lanocolata a variety of P. Pennsylvanica.

We call attention to our remarks two weeks ago, respecting P. Peruviana which is the species generally cultivated in this county, and suggest to those who have the time and inclination to experiment with a view to cross-breeding, that there is yet time this season to do so.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

NEW HAVEN, Ct., April 6.

I WISH to express the gratification I have experienced from the series on "Bulbs" by W. C. L. Drew. He mentions and describes several which I have never seen mentioned in any catalogue, and new species also of old sorts. Is W. C. L. D. a florist? mercantile I mean, as in that case one might procure some of the new beauties. G. H. ALLING.

PITTSFIELD, Mass.

I HAVE flowering Almonds, straw-colored, sweet-scented Lily, Perennial Phlox, Gladioli bulbs; Peony, Oxalis bulbs; viz. Bowiei, bright pink, common white and pink; straw-colored variegated Ledum; these I wish to exchange for Pansy and Aster seeds, Centennial seed field-corn and Murdock's corn; Lily bulbs except Tiger; Campanula, except white.

MRS. M. M. WASHBURNE.

WILL CO., Ill.

I HAVE never seen in American catalogues the "English Vegetable Marrow" mentioned. There are many thousands of them sold in the London markets annually, and wherever I have given one for trial, the request has been made for seed. In case you may not know it, I inclose you a few seeds. They require the same treatment as pumpkins or squash; only want to be cut and cooked when young, and before they begin to ripen; boil half an hour and serve up with butter-sauce, taking out seeds and cutting into quarters. A. E. BEADLE.

CARROLTON, Pickens Co., Ala., April 21, 1878

MANY thanks for the plants sent. I received them in good condition, and as they are all new to me I am very much obliged for them. I should like to join in your exchange, but as it commences too late in the spring for most of my bulbs, I will have to try and find some one that will exchange in the fall with me. I have fresh Hyacinths from the open garden for the Christmas holidays, and most of the Spring-

blooming bulbs are then showing their leaves. I have single and double white, and single and double blue, and a single black (?) Hyacinth. Then single and double Narcissus and lemon and orange color and white Polyanthus Narcissus and the Pheasant-eye Narcissus, but as they ought to be sent in the fall I will have to write to some of your exchanges. I have other kinds of bulbs. I should like to get in exchange some Dahlias and Gladioli and Peonies. I want to get shrubery and bulbs rather than annuals. I will exchange seed of such as I have for Pansy and Verbenas. I have a large yard and have been trying to get Roses to fill up the space. I have a good many, but most of them are spring-bloomers. They are in full bloom now. Then sweet-scented evergreen Honeysuckles and red and yellow coral Honeysuckles are all in full bloom. I love flowers and love to work with them, and succeed well with what I plant. I have a Madeira Vine which is ten feet high that has grown this spring. For annuals, I plant Morning-glories in variety and Thunbergias, Ipomœas and ornamental gourds: I have a fine show of vines in summer. I have some hanging-baskets that are nice. I should like my flowers to look pretty but my baskets do not show well. I have a few Geraniums that are growing nicely. I shall try some in the open yard this year. The sun shines so hot here in summer that such things do better shaded. I had a Coleus, but it died in the winter. I was very sorry, for I think they are very pretty. I plant my seed in a mixture of well-rotted cow manure and leaf mold with a generous supply of sand, and they do well. All pot plants get the same to grow in, and I always meet with success, if my plants are not bruised when I receive them. ALABAMA.

CATALOGUES, &c., RECEIVED.

A CIRCULAR from the State Agricultural College, Kansas, calling the attention of Western breeders of Berkshires to the importance of securing a permanent record for their herds in the pages of the American Berkshire Record.

NINETEENTH Annual Edition Sorgo Hand-Book. A treatise on the Chinese and African Sugar Canes—varieties, culture, and manufacture. Blymer Manufacturing Co., Cincinnati, Ohio. Also catalogue of Cane Mills and Evaporators, Steam Engines etc., manufactured by them.

ABRIDGED New Catalogue of flower seeds and plants. WILLIAM E. BOWDITCH, 645 Warren Street, Boston, Mass. House established in 1837. Free.

PROCEEDINGS of the New Jersey State Horticultural Society at its Third Annual Meeting held at New Brunswick, Feb. 6 and 7, 1878. GEO. SUCH, President; E. WILLIAMS, Montclair, Recording Secretary; B. B. HANCE, Red Bank, Corresponding Secretary.

The Swine-Herd.

WE invite the attention of our readers to the liberal offer of Col. Curtis found in the advertising columns. Now is the time to get a fine pig at half the usual rates.

SOME NOTABLE BERKSHIRES.

BERKSHIRES are a very fashionable stock both here and in England, and that they are profitable needs no demonstration other than the satisfactory bank balances of those who breed successfully.

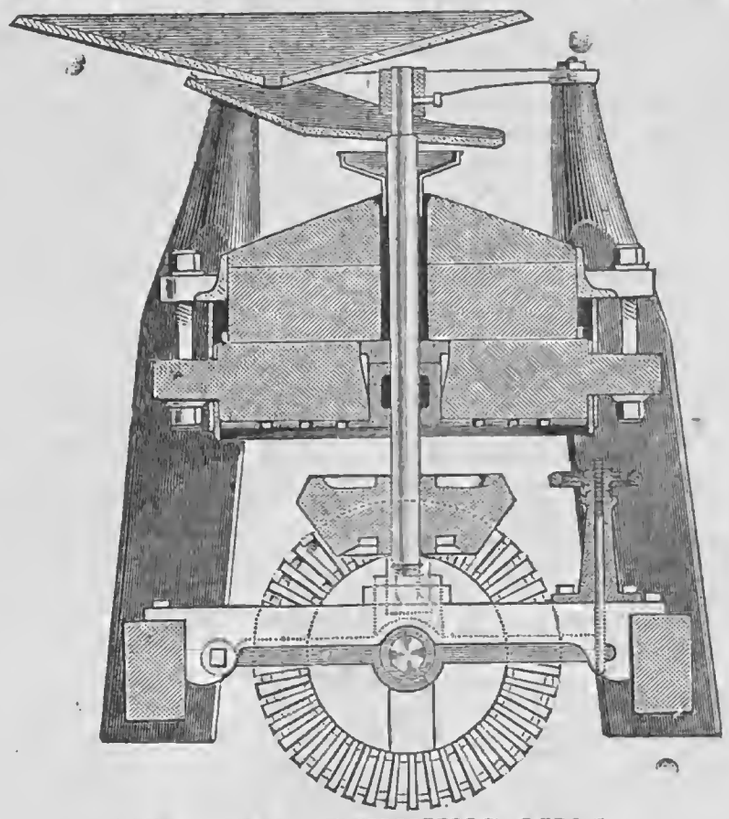
Foremost in the ranks of this class is Mr. T. S. COOPER, who by his judicious selections from the best English herds, and his subsequent careful breeding has produced one of the most admirable lot of Berkshires to be found in this country. Mr. COOPER imported his first lot, gathered together by personal selection, in 1875. Such men as STEWART, SWANWICK, HUMFREY and BAILEY supplied the animals. At intervals since then, in person or by proxy, he has added to previous purchases, until he has at present in his herd as breeders, nine boars headed by Hillsmere, and forty-one sows whose names are a record of the best blood.

We illustrate three sows, Prima Donna 1st, Belladonna's niece, and Prima Donna 2d. These animals are shown in the illustration in the order named, beginning at the left hand, Belladonna's niece being the middle animal in the background.

Prima Donna 1st was bred by Mr. HUMFREY of England and imported in 1877. She was got by Duke of Swinetown, dam Belladonna's sister. Her aunt, Belladonna, was the Sweepstakes sow of the Centennial, an animal for which her owner refused sixteen hundred dollars: This sow's last litter is most promising. The get was by Royal Maybourn and the ten youngsters at birth weighed twenty-nine pounds, and a week later came within one pound of doubling this weight.

Belladonna's niece is also from Mr. HUMFREY and was imported in August, 1877. This sow is a full sister to the above mentioned animal. Soon after her arrival in this country she was exhibited at several prominent fairs, notably at St. Louis, where she took the first premium as the best Berkshire on the grounds.

Prima Donna 2d was imported from the same source, May 1877. She is hardly the equal of her excellent sister, but possesses in a concentrated degree and smaller compass the qualities of a good Berkshire. The trio are exceptionally fine representatives of the breed and those who secure their produce will not, we think, regret the purchase.



AN UNDER-RUNNING MILL.

Industrial Implements.

AN UNDER-RUNNING MILL.

IN answer to an inquiry concerning under-running mills, we give an illustration of one, and the points claimed in its favor. Our cut is a representation of the mill known as the "Queen of the South," and we are under obligations to the Straub Mill Co. of Cincinnati for the information we now give.

In these mills the under stone is the running stone in all cases, and on this account, it is claimed, grain may be run in through a very small eye, and be ground nearer the center. It will not choke. As gravitation tends to force the running stone away from the upper one, there is little fear of injury to either stone if the mill runs empty. There is no bush in the mill, and the gearing being below the stones—in sight—is easily oiled. The admirable construction of the mill, the perfect face of the stones, and the precision of motion, no matter what the speed, cause a superior product to be run off, without undue heat or dissipation of carbon—in short, cool grinding. These mills are made of varying sizes, and can be operated by any man of ordinary intelligence, without special training as a miller; hence they are well adapted to farm uses. Steam, water or ordinary farm powers will operate them. During a business career of upward of thirty-four years this firm has put in operation over seven thousand of these mills, which is a good test of their popularity.

The following brief description of the improvements in the structure of this mill will, with the aid of the illustration, make its claims clear.

(1.) A cast-iron back with hub extending upwards through the running stone, where it is secured with iron wedges and metal; it is also secured by the band around the stone. The hub of this plate is bored out with a taper reamer, and the spindle is fitted to this taper hole, and prevented from turning by a feather secured in the spindle.

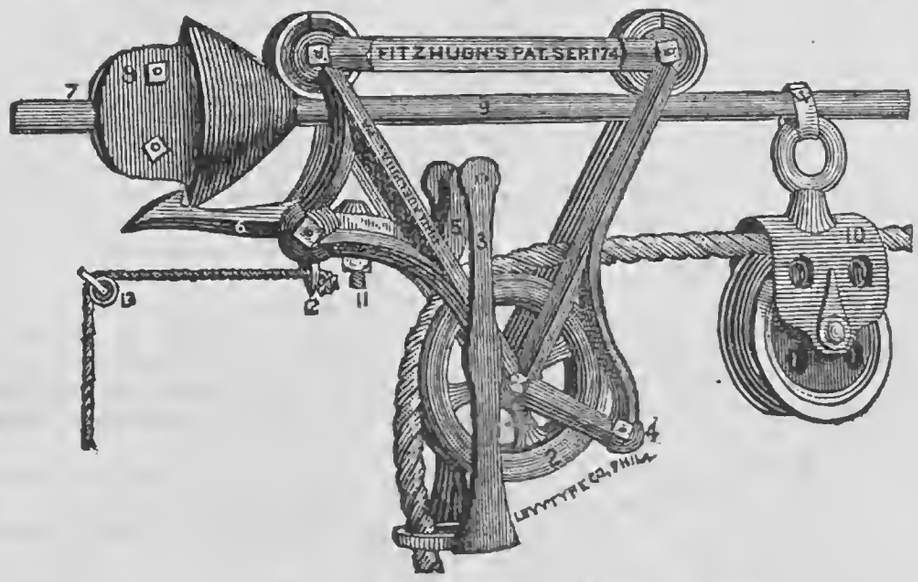
(2.) The cast-iron bridge-tree is provided with a lighter-bar, post and regulating screw, and is secured to the girths of the mill; the link passes down through a bored seat in bridge-tree, and rests on the lighter-bar, giving a perfect center lift to the spindle.

(3.) The counter shaft in geared mills is hung to the lighter-bar, keeping the gear always to a uniform depth.

(4.) The device for framing consists of a long nut in the frame of mill, through which passes a stud with a jam nut under the frame to prevent the stud from turning; on the upper end of the stud is a six-sided collar, on which the lug of the bed or upper stone rests, and above this lug is another nut to fasten the bed stone to the stud and frame. Three of these studs are used (instead of five as in the old plan), making it much easier to adjust the bed stone to the runner.

(5.) The upper box of the spindle is made of cast-iron, lined with Babbitt-metal, and is adjustable by means of four set bolts, through the hopper stool. There are other minor improvements, such as style of finish, etc.

The Company issue an interesting and instructive pamphlet on mills, that it would be well for our readers to read. Its distribution is free on application.

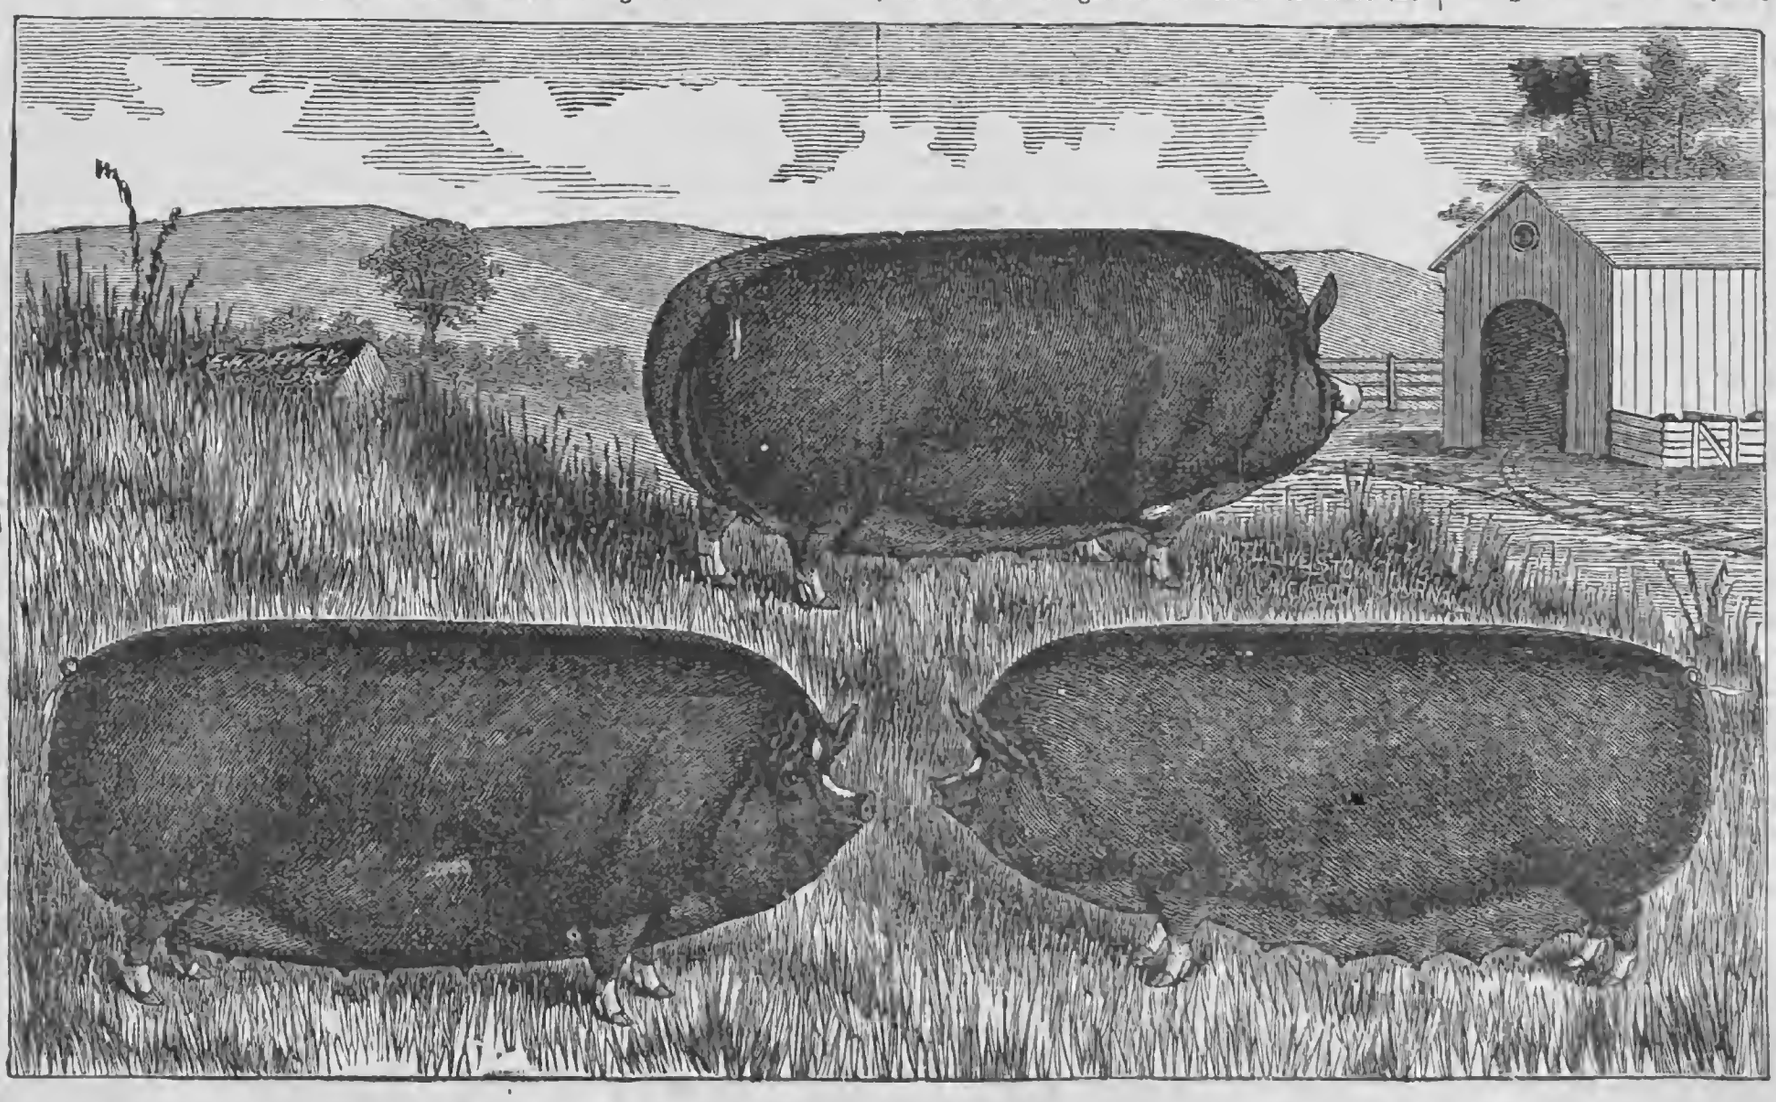


THE AMERICAN HAY ELEVATOR.

THE AMERICAN HAY ELEVATOR.

THIS elevator first attracted our attention at the Centennial. The cut we present showing single-geared implement tells the story without much explanation being required. This cut is an exact representation with numbered parts, which will be found duplicated on the castings for convenience in adjusting elevator. The single gear has some advantages over the double, viz.: the horse travels one-third the distance, requiring a third less rope, while raising the hay one-half faster. In the double gear there is a double purchase which gives an advantage of nearly one half of raising hay. A practical and important feature of this machine is the eccentric brake which holds the hay up after the car is unlatched and while passing back into the mow. This brake is automatic and works perfectly without the aid of springs, ratchet, or rings on rope. Figure five in the cut shows its position. The car in operating, is brought back to the "catch" by means of a weighted cord, and when the longitudinal distance to be traversed is greater than hight of barn a "spool" is used in connection with this cord which does away with any assistance on part of operator, as the car runs back promptly. The advantages of this elevator may be briefly summed up. It is made of the best malleable iron, and is without springs, or traps. The track is of ¾ inch iron rod, well braced, and as the elevator runs on both sides of this rod jumping the track is out of the question. The rod and wheels of elevator presenting a beveled surface to each other, the car swings with ease to any required angle, consequently the hay can be handled at either end of the load while the draft is always from the center of the elevator, avoiding side pulling, straining, and rope-cutting. The return spool brings the car back from any distance, accomplishing automatically a task that heretofore has devolved on the operator. Hay may be loaded from within or without the barn, and in short the "American" is a convenient, low-priced, serviceable implement. Mr. FITZHUGH, the inventor, has met with flattering success both in this country and abroad. The elevator may be seen, or circulars procured by addressing J. R. FITZHUGH, 1708 Barker Street, Philadelphia, Pa., or 55 Beekman Street, N. Y.

THE Towanda Eureka Mower Co. have shipped two of their New Direct Draft Mowers to Australia, and six to New Zealand, this season.



PREMIUM BERKSHIRES.

The Querist.

ANSWERS TO CORRESPONDENTS.

Adams Co. Wis.

H. B., Peoria, Ill., asks for information about the climate, soil and state of society of Adams Co., Wisconsin, and its adaptability for farming purposes.

ANS.—In reply our friend Mr. S B PECK, who is extensively acquainted with the north-west, says:

I know little about Adams County, Wis., but have an idea that it is a fair farming county, but I can tell H. B. that the same latitude in this State has many decided and important advantages over the region of which he speaks. Among these are its special adaptation to fruit in all the Lake Shore counties and to winter wheat all over the State, there being a difference in favor of the east side of Lake Mich., over the west side, in the extremes of winter's cold and early and late frosts, of from 10 to 20 degrees of Fah. We never have floods or tornadoes, and though we have fewer rainy days, we have also less droughts in these Lake Shore counties than east or west of us. Furthermore, the fact that the counties of Muskegon, Oceana, Mason, Manistee, Benzie and Grand Traverse are engaged mainly in lumbering has a two-fold tendency; first, to cheapen the price of lands for agricultural purposes and, second, to raise the home market price of all farm produce. Now all the facts I mention are not only susceptible of proof but of the most lucid explanation, but this would take more time than I could spare and more room than the RURAL would allow me. Those coming into these counties to settle in the farming business, must expect either to clear up their farms or purchase small and rather rude improvements, for what this country lacks most of all is practical farmers, and next, manufacturers in other industries than lumber. Its shipping facilities are hardly equaled, its climate unequaled east of the Rocky Mountains in this latitude; its fruits of world-wide renown, and its people remarkably healthy. Owing to the peculiar situation of this country in regard to early thoroughfares of travel, it has, until within a very few years, been little known abroad.

About the Arkansas Valley.

Henry Oliver, Baltimore Co., Md, asks 1. whether the lands in the Arkansas Valley, along the Atchison, Topeka and Santa Fe Rail Road are good for farming; 2. whether there are any Government lands close by; 3. what are the prices there of ordinary farm horses and what are cows selling at.

ANS.—From a trustworthy source we learn that the lands along the A. T. & S. F. R. R. are as rich as can well be found anywhere; excellent for all kinds of farming. 3. For Government lands, it will be necessary to go further west than old frontier settlers think it prudent to go. The further west, however, the dryer and more uncertain the climate. 3. Good horses suitable for farm work, can be bought for from $75@125; good grade stock cows just now can be got for about $25 a head.

Strawberry Mixing.

N. Williams, Montgomery Co., N. Y., asks whether two varieties of Strawberries planted side by side, mix so as to affect the varieties; in other words, will runners from each plant or variety be affected? Will the fruit also mix? Which is the best variety for garden or home use without regard to its adaptability for transportation.

ANS.—No, except as they become entangled and it is difficult to tell "which is which." There is no mixing. Strawberries can only be mixed (crossed) through the seed. Some flowers are perfect (*i. e.* possess both stamens and pistils); some possess only pistils. These latter, if they form fruit, must receive pollen from other flowers which possess stamens as well. The edible portion of a strawberry is not the fruit properly speaking. It is a fleshy growth of the receptacle. What we call the seed is really the fruit. There is a general notion that melons and cucumbers mix. The seeds may. But the effect is shown only the next season in the fruit raised from the mixed seeds. In our own grounds we prefer Borden 30. But it may not do well with you.

Lawn Mowers.

L. D., Hempstead, L. I., makes certain inquiries respecting lawn-mowers.

ANS.—When your lawn becomes hard and the sod close and thick, a roller can do no good. Lawn-mowers with large iron rollers are excellent for seeding grass, at least for the first year and also for sodded lawns until the sod is established and has become level. Otherwise a light-running machine without an iron roller would answer your purpose. The "Philadelphia" is as good as any we know of, and the 18-inch may be managed by a strong boy twelve years old. It is a simple contrivance and except that it should be oiled often, may be regulated once for the entire season. 2. This is the lawn-mower which was used upon the lawns at the Centennial. At least we saw it in use there and noticed no others. R. H. Allen & Co., 189 Water St. are agents for this city.

A Cheap Green-House.

E. A. Beadle. Will Co., Ill. says: I have taken the RURAL for several years, and although only a mechanic, I am much interested in it especially in its designs for houses. I would ask as a favor, that it would tell me how to construct a small green-house on a cheap scale, as I have at present more time than money, and could do the work myself.

ANS: BY MRS. ANNIE L. JACK.

Knowing that our contributor, MRS. JACK, had constructed a green-house in an economical manner, we submitted the above question to her and and here give her answer:

For years we have gathered every summer a few choice plants, and last season one of the RURAL editors sent us a box of green-house plants, so fresh and lovely that we were a family of exclamation points. But the winter so long and severe, with the unequal heat of our sitting-room, the coal gas, and dry atmosphere, had a direful effect on our pretty treasures, and this spring I hinted to the head of the house-hold my desire for a miniature green-house of my own—not expensive, of course, but suitable for our needs. I left home for a few days, before the spring work began, and on my return, a new and unusal noise at the back door caused me to proceed thither.

It was the "guidmon" and all the boys at work in an excavation, six feet below ground, the length of the kitchen, and altogether 21 feet long by 12 feet wide. This cellar-like place was built round with stone, gathered at times on the farm and laid aside to be utilized as building-stone whenever needed. The lime cost about $1 50, the sand was obtained near-by, and the work so far was done by the willing hands of the household. About six inches of stone above ground, and two panes of glass on the straight, then a slope over one of the kitchen windows, giving 14 feet of glass. This window was cut down to form a door half glass, and from the kitchen range we intend to place a pipe for hot water to heat the building in the coldest weather, while the heat from the kitchen will be sufficient in moderate winter weather; but this is a matter to be decided only by close observance of the thermometer. A door at the south end is useful as a passage-way through which to carry the plants out and in and, in the summer, we intend to train a couple of Black Hamburg grape-vines over the rafters. These are to be planted outside and taken in through holes left for the purpose in the wall. The carpenter's work was such as any mechanic could do, the children being able to assist with glazing, and helping in many ways. There are seven hand-made sashes, 14 feet long by three wide costing, each, two dollars. The wood for rafters and plate cost three dollars. The glass, seven by nine, can be procured cheaper in many places than with us. The carpenter's work of framing, outer door, and steps, amounted to ten dollars, and the benches and stands we make at home. This green-house is specially constructed to suit our cold climate, the depth below ground causing it to be easily kept warm. It is suitable for green-house but not for stove plants, and any mechanic having time to spare, can save everything but the actual cost of material.

The "Cricket" Again.

C. E. M., Spring Hill, inquires whether in case of his sending a dollar, he could get a "Cricket Clock."

ANS.—The offer of the Clock was made to induce old subscribers to influence others to take the RURAL, and to give them a valuable consideration for their efforts. All along the effect intended has been to increase the number of our readers. If C. E. M. will send us five dollars in payment for two new subscribers, he will have aided our efforts to this end, and be handsomely rewarded with a *gift* of a "Cricket Clock." We could not accede to his proposition without violating our contract and, moreover, losing money. Our main object, we repeat, is an addition to our subscribers, not to our coffers. Could we consistently do so, it would give us pleasure to gratify him and hundreds of others who have made a similar request.

Blue Stone, Blue Vitriol and Copperas.

Charles Mungham, Lambton Co., Ontario, asks what is the difference between blue stone, blue vitriol and copperas.

ANS.—Blue stone and blue vitriol are two names for the same substance, sulphate of copper. It is best prepared by dissolving oxide of copper with dilute sulphuric acid; a large quantity is also produced in the process of roasting copper ores. The salt crystalizes in large, prismatic crystals, which contain almost exactly one-fourth their weight in metallic copper. It is used in dyeing, preparing various pigments, in medicine as an emetic, and also to destroy the germs of smut in wheat, by soaking the grain in a solution of the salt. COPPERAS, known also as green vitriol, is sulphate of iron, and forms green, transparent, prismatic crystals, readily soluble in water. It is largely obtained by the decomposition of iron pyrites as well as by dissolving metallic iron in dilute sulphuric acid. It is used in dyeing, tanning, the manufacture of pigments, and making black ink, and in medicine as a tonic. The term copperas was formerly synonymous with vitriol and included blue, green and white vitriols, respectively the sulphates of copper, iron and zinc: now, however, it is applied only to the sulphate of iron.

Miscellaneous.

W. H. Perry, Jefferson Co., Neb., being entirely a novice on a farm, inquires for the name of a book of some kind that will help him in learning "how to farm it."

ANS.—There is no one book that will give you the information you need. Many topics, such as drainage, dairy, poultry, manures, cattle, etc., etc., all of which constitute important farm interests, are treated separately and at length. If "How to farm it" could be treated exhaustively in one book, there would be little need of agricultural literature. The following books occur to us which, no doubt will render great assistance:

Mason's Agricultural Cyclopedia; Waring's Elements of Agriculture; Johnson's Elements of Agricultural Chemistry; Jacquo's Manual of Garden, Farm and Barn Yard; Bossingault's Rural Economy; How Crops Feed—How Crops grow, by Prof. Johnson; Allen's New American Farm Book.

Mrs. R. C. Kerr, Richmond Co., Ga., asks where the following plants can be purchased:

1. Camphor; 2. Guava; 3. Coffee; 4. Pine-apple; 5. mouse-colored Iris; 6. Fine, large Pelargonium, such as the old Lady Washington, now never advertised; 7. She also inquires whether she can get a Cricket, and 8, some of the plants and flowers gratuitously offered by the RURAL.

ANS.—1. The Camphora officinarum (Camphor Tree) is an evergreen of large size. Dryobalonops camphora, a tree from which a far more costly article of Camphor is obtained, is a native of Sumatra, also a tree of large growth. Do not know where they can be obtained.

2. The one best known is Psidium guaiava of which there are several varieties. This is a small tree, a native of the West Indies, and may be cultivated under glass for its pretty foliage and flowers as well as for its fruit. Try Geo. Such, South Amboy, N. J.

3. The botanical name of the coffee plant is Coffea Arabica, a native of Abyssinia and Western Africa. It will not stand frost and in this climate can only be grown under glass. Perhaps Commissioner LE DUC can supply you with a plant.

4. The pine-apple is Ananassa sativa, probably a native of Brazil. The fruit may be raised in any greenhouse in which the proper degree of moisture and temperature can be maintained. Can be obtained of any florist that deals in stove plants.

5. We do not know of any Iris of this name. There are many varieties which might be called "mouse-colored." Those of Iris Germanica are very pretty. Woolson & Co, Passaic, N. J.; Hoopes and Bro. Thomas, West Chester, Pa.

6. There are hundreds of varieties of what were once called "Lady Washington." Almost any florist can supply them.

7. See answer to C. E. M. 8. Our next seed distribution will be announced later in the season, when an application will be duly attended to.

M. W. F., Bryn, Mawr, Pa., would like to know how and where to propagate such shrubs as Wiegela, Spiræas, Tartarian Honeysuckle, Box—the evergreen shrub—and what is commonly called "Mist Tree"—a handsome ornamental shrub.

ANS.—Wiegelas are best propagated from cuttings of the half-ripened wood in the fall, though cuttings of this and the others mentioned (except Mist Tree) may be struck from mature wood. Box is propagated freely by divisions of the plant or by cuttings. We would advise our inquirer to plant seeds of Wiegelas next fall. They germinate readily, making fine plants in a year and often run into well-marked varieties. By "Mist Tree" we presume the old but beautiful Rhus Cotinus is meant. This is best increased by pegging down layers and covering them with earth.

A. G., Seneca Falls, N. Y., inquires where he can procure President Lincoln, Gt. American and Downing Strawberries.

ANS.—E. P. Roe, Cornwall-on-Hudson, T. B. Miner, Linden, N. J., E. & J. C. Williams, Mount Clair, N. J.

F. K. G., De Golia, Pa., asks whether the name China Pink, given thereabouts to a tender biennial plant with very showy flowers, is the correct one, and sends us seeds from which to determine.

ANS.—The seeds are, no doubt, those of the China Pink, Dianthus Chinensis.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MAY, 4TH.

RURAL SPECIAL REPORTS.

ST. CHARLES, Kane Co., Ill., April 28.

THE past week has been one of almost continuous rain; consequently but little advancement was made in farming. A good deal of corn-planting would have been done, had it not been so wet; but as it is, none has been planted hereabouts as yet. Should this week prove as fair as the present weather promises, most of the corn will have been planted by the middle of next week. So far this country never had a better prospect of an abundant yield of all her products than she has the present season. All the fruits promise exceedingly large crops. All the farmers have to fear at present in this neighborhood is that the prices of milk, butter, etc. will drop too low to leave any margin for dairy products; and just now it seems to me as though this would be the case during the summer months. As this country is eminently a dairying region, the prices of those products affect us more than those of all others. This is, indeed, the "banner" dairy county of this State, as some of the readers of the RURAL must, of course, well know. J. B. T. W.

HARRIS CO., Texas, April 28, 1878.

THROUGH the month of March, and as far as the present in April, we have had but very little rain, consequently the ground is dry. Irish potatoes are being dug. Though a fair crop, they would have yielded still more had they had a little more rain. There has been an immense quantity of them planted here. The first ones sold for about half the price brought by Irish potatoes last year. Before the season is over, they will come down very low, since we have no means here to preserve them any length of time. Plums and peaches are all curculio-stung. Pears, though they have bloomed finely, did not set well on account of the dry weather during their time of blossoming. Figs and grapes look promising. Japanese Medlars are ripe.

In flower gardens, Lilies, Amaryllis, Funkias, Clematis, Allamandas, Meyenias, Rhincospermums, Chinese Hibiscus, Clerodendrums, Pomegranates, Oleanders, Yuccas, Magnolias, Tecomas, besides a host of perennials and almost all of the annuals are in bloom. Roses rest a little; they are through the first crop of flowers. Gladioli show their spikes. G. M.

SANTA CRUZ CO., Cal., April 9th, 1878.

I SEND you a package of flower-seeds for distribution, also a few Shell-Flowers Seeds, as I saw a request in the RURAL for all your friends had to spare. They are not the seeds from those received from the RURAL Office last season, as those did not germinate, but these are from flowers belonging to a lady living in the Valley. They were planted in the fore part of July and remained green till January, although we had several sharp frosts. The Aster Seed are nearly all from very fine flowers, and the Pinks are from the best strains that are cultivated, and of 10 or 12 colors, all from double flowers and, in fact, they are all from very fine flowers. If you have any seed of Tailby's Hybrid Cucumbers I would like to have a few, as I can get none from the seed stores. The seeds sent by the RURAL came all right, for which accept many thanks. A. CULBERTSON.

REYNOLDS, Rock Island Co., Ill., Ap'l 20, '78.

WE have had a very mild winter, our heaviest snow, March 28 9, lasted but a short time. Apple, Cherry and Plum trees are in blossom. Corn in the ear 23c. per bushel, shelled 26c; potatoes 40c. per bushel; hay from $5@$6 per ton. Wheat and oats up and looking fine. Some have planted corn—most think it too early. Ground nearly all ready. Nearly all the young men wear the blue ribbon. Temperance meeting every Friday evening. C. H.

Miscellaneous

WESTERN ECHOES.

KITTATINNY and Lawton Blackberry briars have winter-killed with me badly every winter, despite all the cutting back, stockiness, and hardening of the branches I could render them, until this last winter when I gave them protection, and this spring upon raising them, they have withstood the winter well, which of course is not at all new, and I only refer to it to say that it pays one to give them space and any care at all, to add a little more work, and lay them down and protect them. In this connection, I will say that from close observation of the reports of those throughout the West, who are trying them, the Snyder is *the* Blackberry, all things considered. I came to this conclusion after eliminating the testimony of those who have the Snyder for sale.

Since a great deal is being said about the germination of commission seeds, I will add that to test the matter for myself, last year I procured

twenty-four packets of flower seeds I had strong reasons to suspect as being very old and worthless, and the result was, not a single seed germinated under favorable circumstances.

With one bare exception strawberries have never been grown in this part of Illinois, unless you would so regard putting out 25 to 50 plants of some unknown sort, in a waste corner of the garden, and then see them no more until fruit is expected the next year. To see which sorts would do best, last season I set out thirty varieties, beginning with Wilson and ending with Great American, and so far as I can judge at present, no sort is going to stand our climate, with all its winter vicissitudes, like Capt. Jack: yet all the varieties we set out wintered well except Patapsco, and Pantuxent, which were procured at Washington and put out *after* several hard freezes, and it is but fair to add that Capt. Jack was procured in the same locality, and put out the same day.

As I have before said in these humble articles, the grape will never be beneficially grown, as an apple is, by farmers in general here. While at a neighbor's to-day, who interests himself more in growing fruits than any of his fellows, I was asked with great solicitation, if I thought his one-year-old grape-vines, probably 18 inches in hight, would bear this season; I did feel sorry for him as I tried to explain all about pruning, growing fine large roots first, and expecting a crop in two or three years.

DR. A. C. WILLIAMS.

Hugo, Ill., April 13, 1878.

ACKNOWLEDGMENTS.

WE have to thank Mr. JOHN SAUL, of Washington, D. C., for a case of about sixty new or rare plants. The perfect, fresh, undisturbed condition in which they were received shows the great skill which many florists and nurserymen display in packing and shipping their goods. We would have been willing to guarantee their arrival in England in an unimpaired condition.

LINDEN, N. J. April 22, 1878.

I SEND you to day by mail the *cream* of all my new grapes: One Carlotta, (white), the best grape in the United States; one Victoria, (white), about as good as Carlotta; one Augusta, (white), fine; one Lexington, (black), a splendid sort; one Rockingham, (black), no equal in this country.

As none of these grapes will be *sold* for some years, you will please not to allow a *vine* or *cutting* to leave your premises till I give consent.

Please label *durably* so that you can report on the varieties when they fruit. T. B. MINER.

Received with thanks.—[EDS.]

REPORTS, &C., RECEIVED.

FIFTH ANNUAL REPORT of the State Board of Agriculture to the Legislature of the State of Kansas for the year ending Nov. 30, 1876, embracing statistical exhibits with diagram of the agricultural, industrial, mercantile and other interests of the State and sectional maps, well executed in colors, of each organized county, showing size, location, railroad and public lands, towns, school-houses, etc., etc. A valuable work of 312 pages. ALFRED GRAY, Secretary.

Implements and Machinery.

BIG GIANT CORN MILL.

Every Man His Own Miller.

The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully that will grind Shelled Corn fine enough for family use.

Grinds twice as fast as any other Mill of same size and price. Manufactured by

J. A. FIELD, SON & CO.
922 N. 2d St., St. Louis.

EVERY **FARMER** SHOULD HAVE ONE.

Nichols' Patent Double and Single Header Wind Mills, and Challenge Feed Mills, Horse Powers, Wood Saws, Pumps, Etc. For Circulars, address CHALLENGE MILL CO., Batavia, Kane Co., Ill.

GARDEN ENGINE AND FIRE EXTINGUISHER. For Washing Windows, Carriages, etc. Protects Buildings from Fire, and Trees, Vines, etc., from Insects. Throws water 50 feet. Easily carried. No Dwelling, Country Home or Factory should be without the Fountain Pump. Send for large Illustrated Circular. J. A. WHITMAN, Sole Proprietor and Manuf'r, Providence, R. I.

Pat. Oct. 31, '76 & Apr. 3, '77

The Boss Sickle Grinder.

[TRADE-MARK PATENTED.]

Every Farmer should Have One. Simplest, most durable and perfect Sickle Grinder in the World. A boy can run it. Can be changed from an Oscillating to a stationary Stone in a moment. Is the best Grindstone in use for all purposes. For Sale by all dealers. Good Agents and canvassers wanted. POWELL, STEVENS & DOUGLAS, Waukegan, Illinois.

Implements and Machinery.

Established 1845.

—WOODEN PUMPS—

The Best is Always the Cheapest.

MADE FROM MICHIGAN WHITE PINE.

Wholesale and Retail.

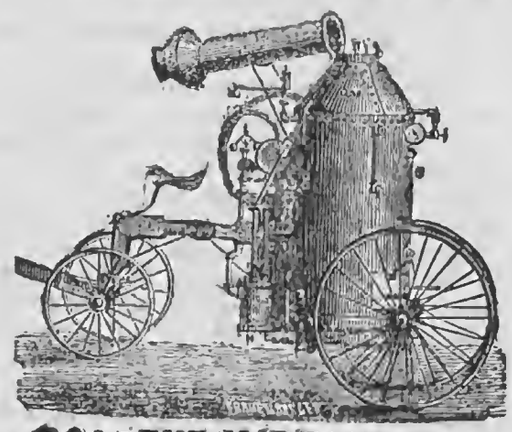
—WOODEN WATER PIPE—

Always on hand and made to order.

Also, Chain Pump Tubing and the Rubber Bucket Pumps. Send for Circulars.

H. H. BABCOCK & SONS, Watertown, N. Y.

CANTON MONITOR ENGINE.



THE IMPROVED **SWEEPSTAKES THRESHER**

MADE BY

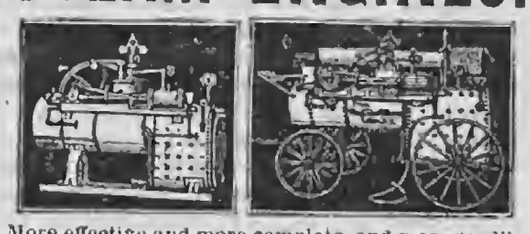
C. AULTMAN & Co.

CANTON, O.

Send to the Company for Descriptive Circular.

The **THOMAS PORTABLE ENGINES** are made to meet a want long felt by Threshers, viz., Lightness of weight, with strength and durability. They are the lightest made, and are guaranteed to do the same amount of work as those 800 to 1,500 pounds heavier, and with much less fuel and water and less amount of steam pressure. Nothing equals them. Send for Circular. Made by J. H. THOMAS & SONS, Springfield, Ohio.

STEAM ENGINES.



More effective and more complete, and more readily adapted to the various mechanical and agricultural uses than any other in the market. Practical improvements, accumulated from 20 years' manufacturing experience, with reputation maintained and success established.

Send for Circulars, descriptive, and containing testimonials concerning our PORTABLE, STATIONARY and AGRICULTURAL STEAM ENGINES.

WOOD, TABER & MORSE,
Eaton, Madison Co., N. Y.

B. W. Payne & Sons, Corning, N. Y.

Established in 1840.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MAY 11, 1878.

WE beg to announce the first of a series of practical articles entitled "Pocket Money for Young People." The first, by Mrs. ANNIE L. JACK, appears in this issue. We believe these articles will be an attractive feature, and prove of real benefit to our young readers.

A SECRETARY OF AGRICULTURE.

A BILL to make the Bureau of Agriculture a separate Department of the Government and to raise its chief to a seat in the Cabinet has been reported in the lower House of Congress within a week. The Committee on Appropriations had, as compared with the previous year, reduced nearly all the items for the support and efficiency of the department, but despite the efforts of these pseudo-economists, the House towards the close of the week, almost in every instance, increased the appropriations. In view of the previous proposition to raise the agricultural Bureau to the dignity which the RURAL NEW-YORKER has always claimed to be its due, the several votes enlarging the means for its efficient maintenance, are not without significance.

In Congress and in the columns of some of the journals that, once in a long while, deign to notice the agricultural interests elsewhere than in the special editions published for their bucolic subscribers, one of the chief objections to doing justice to the agricultural department seems to be the alleged inefficiency of its chief. With regard to the truth or falsehood of this allegation we have no intention of speaking here, and moreover the Commissioner has already found more than one able defender on the floor of the House. But even granting that the head of the present Bureau would not be as admirably fitted for the same position in the projected Department as these discriminating gentlemen might wish, cannot the same charge be made, with perhaps more justice, in regard to the heads of other Departments of the Government? Have not similar assertions been made concerning the chiefs of various Departments in every administration from Washington's downwards? And has the notorious unfitness of the officials in some cases, or the reiterated assertion of their inefficiency in others, ever been considered a valid reason why the interests the offices had in charge should be debarred from a just representation in the Government?

Moreover, while the agricultural interest of this country, the basis of its prosperity and a good deal of the superstructure, demands as a right a representative in the Cabinet of the nation, it claims no right to nominate Gen. LE DUC as that representative. An equitable influence in conducting the affairs of the country, and a fair proportion of advantages from the taxation to which it is subjected are the rights the farming community is entitled to. These it cannot secure so long as it is unrepresented in the Administration, yet this influence with its adjunct, a place in the Cabinet, farmers are bound, ere long, to achieve, through the present members of Congress if practicable, if not, then through the more fair-minded successors whom the agricultural vote will send to Washington in their stead.

HARD TIMES.

"How is business?" is a question asked a thousand times a day, and almost invariably the reply is, "Very dull—but little doing." And we hear reports from all over the country of mills lying idle, manufactories working on half-time and thousands of people out of employment. The quantity of goods manufactured and sold is very much less than it was ten years ago, and people are asking with fear and trembling: "What is to be the end? Will better times never come?"

It has occurred to us that our whole community may possibly be laboring under a mistake; may not clearly apprehend what good times really mean. If we carefully examine the matter, perhaps we shall find, after all, that there is quite as much business done at the present time as is necessary—as much as is well for the public good.

The majority of our people are agriculturists. Have there been any complaints from this class that, on account of the diminution of manufacture, they have been compelled to do without articles of necessity—or luxury? Or is it true that the full demand of the country is supplied?

Notice the comparative amount of imports at the present time and it will be found much below the average of former years. If it were three times as great, would it add anything to our prosperity as a nation or otherwise? Every million dollars' worth of foreign goods sold helps to make business lively, and gives employment to a class whose labor as producers would be much more advantageous than as traffickers. And who are benefited thereby? The importers and their clerks mainly. The money to pay for the goods goes out of the country, when it could be well employed at home.

This increase of imports, however, has really but little effect on the amount of business done. If the goods were really needed they would be produced here, if not imported.

As an example of the effect of this stagnation in business, let us take any branch of manufacture—say of hats. Why is it not as flourishing now as ten years ago? Simply because the people buy cheaper hats and less of them. He who spent five dollars for a hat then, contents himself now with one worth three—and not only so, but he will make the three-dollar hat serve him longer than the other used to do. The same is true of all other branches of manufacture.

Do you point to the list of failures—petitions in Bankruptcy and all sorts of insolvency—and ask the reason? Our answer is simply this—there has been too much business done and this is the result. Credit has been given too generally. The desire to sell has been so great that traders have neglected to ask in relation to their customers the question that should be first—is he honest? They have allowed their desire to do a large business to overcome their prudence. They have offered bribes for rascality when they gave credit to men without sufficient capital. Many, not all, have gone into business with the intention of failing, knowing well that settlements with creditors are easily made—too easily for the good of morality.

Another reason is, the inflation of currency during the war gave a fictitious value to property, and induced speculation. Many were induced to buy what they could not pay for, getting credit for a large percentage of the amount. Values seemed to increase, and they thought they were rich and spent their money accordingly. This lavishness pervaded all circles. The mechanic who received five dollars for eight hours' work, saved no more than when he had half that amount for laboring ten hours. The whole community was blinded. Now their eyes are opened. He who thought he was rich finds his debts more than his property is worth. JOHN RANDOLPH said the philosopher's stone was "Pay as you go." Unbounded credit has ruined thousands.

Look at this question and answer it truly. Is not this country better off both as regards real property, and its capacity for production than it was ten years ago? Will not the next census show a marked increase? Is there not more capital now than then?

It is true capitalists are fearful—their money is not in circulation. Manufacturing is not profitable, they say, and trade is hazardous. They do not know one thing that they ought to have learned years ago, *i. e.* that the safest bank of deposit is a bank of earth. There is not a dollar of spare capital in the country that could not be safely and profitably invested in improving the soil, or where, as in some portions of the great West, it needs no improvement, in bringing it under cultivation, plowing and stocking it. Such manufactories as are needed, will be kept at work, the rest can stop without detriment to the country. The capital invested in them can be put to other uses, and the operatives become industrious and independent workers of the soil.

When agriculture in this country receives the attention it deserves, we shall hear no more of *Hard Times*.

CAPTAIN CUTTLE'S ADVICE.

A GLANCE at our agricultural exchanges in connection with the questions that flow in steadily upon us, indicates that the average farmer is not in the habit of taking CUTTLE'S advice. It seems not to have occurred to him, when a good thing is found, to "make a note of it," hence questions are iterated, and advice reiterated on subjects that have been bandied about editorial rooms so long as to have become household words.

To be sure we are always ready to proffer such advice as is asked for, but we suggest that a little method on the farmer's part would add greatly to his stock of practical information, and save him a world of trouble.

There is any amount of good advice, the outcome of experience, proffered each week in this and other journals. It should be made a note of for future use. Among the simplest means to accomplish this end is a common-place book. Any old book may easily be converted to this use. Index it according to subject or alphabetically, and when an item of value is read, clip it, paste it, index it. The pith of long articles may be crystalized into a few words and transferred to the book whenever necessary, with a reference to where and when the article appeared.

The RURAL is indexed with great care annually or semi-annually and this index will always be found of value for purposes of reference; but not infrequently it happens that an important fact is reported in the body of an article whose title, as read in the index, would give no clue to the subject sought for. Such items should be recorded in the common-place book with a memorandum of the volume, page and article in which they are to be found. This is peculiarly applicable to our Questions and Answers.

If our friends would try this plan, they would speedily become convinced of its utility, and thank Captain CUTTLE for the suggestion. It is no small saving of time to have in a condensed and available shape, ready for immediate reference, the essence of the experience of practical men in the adaptation of the best means to an end.

LARIX KÆMPFERI.

THE London Garden of April 20, 1878, in answer to an inquiry, states that the Larix Kæmpferi is hardy under ordinary circumstances but that it "often loses its leading shoots through growing on too late in autumn." It is of slow growth, says the Garden, when young even when in permanent quarters, and in favorable situations it makes only moderate progress. "There are no large specimens of it in this country"—meaning England—'and even young, fair-sized plants, from 10 to 15 feet high, are scarce." It is interesting, in view of these remarks, to call the attention to a specimen of Larix Kæmpferi in Flushing, that stands in perfect health and grace, 25 to 30 feet high. It has probably few superiors or equals in the world, for in America this tree is extremely rare of any size. This climate, however, seems to favor it more than that of England, for we have found it invariably hardy, though slow of growth. There seems to be no other really practicable method of propagating this Larch than from seed.

NOTES.

Wholesome Comment.—We have received a letter from the editor of one of the oldest and most respected weekly journals of this country, from which the following extracts are taken: "I forgot in my last to thank you for your noble article backing up Professor BEAL'S courageous exposure of certain seedsmen. The whole press—a few papers possibly excepted—is, as you know, practically subsidized—if that is the right word—by advertisers, and so there are many 'crying evils' that not only unrebuked but absolutely encouraged, 'wax fat' from year to year. But 'the world is given to lying'; there seems to be very little 'religion of business'; practically men in trade are 'rogues in grain' even though 'veneered with sanctimonious theory.' I verily believe that GOD would greatly prosper any man—including newspaper publishers—who would go straight forward, regardless of present consequences, and all the devices of workers of iniquity. — — — Your brave stand in the articles I mention pleased me greatly, and so I thank you."

The American Pomological Society and Willard C. Flagg.—There is no similar work that we know of, that at all compares with the Proceedings of the American Pomological Society in point of value to those whom it concerns. We had not the pleasure of a personal acquaintance with the Secretary of this Society, the accomplished and well-beloved WILLARD C. FLAGG whose death makes a gap that it would seem could never again be so acceptably filled. But we look over the pages of the volume—his last—and see his familiar name and are sad that he is dead. And so we can, at least, sympathize with the many who knew this worthy man.

Agricultural College Professors.—A writer in Home and Farm, speaks of the Illinois Agricultural College as "a concern upon which several millions of the public money have been spent with no visible, appreciable or sensible benefit to agriculture or agriculturists of the State, and to nobody indeed, unless to a crowd of pedagogues and professors who get three dollars pay for every dollar they earn." So far as the above remarks apply to the professors of agricultural colleges throughout our country generally, we differ with them in so far as to believe that professors get one dollar where they well earn three.

BREVITIES.

THE coming industry, the production of beet sugar.

FRESH clover is good for little chicks that are confined.

WHEAT, wheat everwhere—and it is everywhere looking well.

ACROSS the Atlantic the talk is yet of a possible peace, the preparations are those for a probable war.

WHY is not the Tulip tree (Liriodendron tulipifera) more extensively planted in streets and parks?

A SUBSCRIBER sending for several back numbers and inclosing two ten-cent pieces, writes: "Oh! for the convenient shin-plaster again."

GLADIOLI may be planted for succession as late as the first of July. A little less than three months may be allowed from planting the corms until bloom.

IN Bergen County N. J. the Leghorn fowl is considered the best layer. But it will fly like a pigeon and can never be trusted to sit for the allotted time.

"I AM getting along in years," remarked a neighbor of the RURAL Grounds, "and I have never before seen rye headed in these parts by the middle of April."

MR. CHARLES DOWNING says in the Weekly Tribune that, as a rule, no variety of apple can bear large crops annually, except on rich, deep soils, or where made so by enriching materials annually, and even then, he thinks, at the expense of the life or age of the tree; that is, trees bearing large crops annually will not live as long as trees bearing moderate crops annually, or full crops alternate years.

THE variable effects of plaster on different land are well known. Is not this fact of itself proof of the value of experiments with commercial fertilizers? Why does plaster benefit some soils and not others? Is it because it fixes certain gases of the earth? Is it because it renders potash and phosphoric acid available? Suppose on one plot, plaster is used; on another, potash; on a third superphosphate; on a fourth potash and superphosphate; on a fifth potash and plaster; does it not seem reasonable to suppose that the best yields will enlighten us as to what manurial ingredient is most needed on the experimental field?

Literary Miscellany.

WILLY.

R. H. STODDARD.

I take his picture from my knee,
And press it to my lips again;
I see a hundred in my brain,
And all of him, and dear to me.

He nestles in his nurse's arms,
His young eyes winking in the light;
I hear his sudden shriek at night,
Startled in dreams by vain alarms.

We walk the floor and hush his moan;
Again he sleeps—we kiss his brow—
I toss him on my shoulder now—
His majesty is on his throne!

His kingly clutch is in my hair;
He sees a rival in the glass;
It stares and passes as we pass;
It fades. I breathe the country air;

I see a cottage leagues from here;
A garden near some orchard trees;
A leafy glimpse of creeping seas;
And in the cottage something dear;

A square of sunlight on the floor,
Blocked from the window; in the square
A happy child with heavenly hair,
To whom the world is more and more.

He sees the blue fly beat the pane,
Buzzing away the noontide hours;
The terrace grass, the scattered flowers,
The beetles, and the beads of rain.

He sees the gravelled walks below,
The narrow arbor draped with vines,
The light that like an emerald shines,
The small bird hopping to and fro.

He drinks their linked beauty in;
They fill the thoughts with silent joy;
But now he spies a late-dropped toy,
And all his noisy pranks begin.

They bear him to an upper room
When comes the eve; he hums for me,
Like some voluptuous, drowsy bee
That shuts his wings in honeyed gloom.

I see a shadow in a chair;
I see a shadowy cradle go;
I hear a ditty soft and low—
The mother and the child are there!

At length the palm of sleep is shed;
One bed contains my bud and flower;
They sleep and dream, and hour by hour
Goes by, while angels watch the bed.

Sleep on, and dream, ye blessed pair!
My prayers shall guard ye night and day;
Ye guard me so, ye make me pray—
Ye make my happy life a prayer.

CORA.

CHAPTER XV.

No expense and trouble had been spared to render Lady Vincent's party a success; and the pretty suite of rooms presented a brilliant and tasteful *coup d'œil* as Lady Vincent entered, ready to receive her guests.

Early in the evening troops of little people arrived to have their party, and to be regaled with all seasonable dainties—a huge Christmas tree, over which Cora presided.

She was looking pale but her loveliness hardly needed much coloring; and she was very fair to see as she stood on a stool, and dispensed the toys of all sorts, shapes, and sizes, with which the tree was adorned. At Lady Vincent's entreaty she had laid aside the mourning robes she had worn so long, and to-night she was attired in a dress of rich cream-colored silk, trimmed with soft lace, while round her neck she wore a black velvet band, clasped by a diamond star; the only piece of valuable jewelry Cora possessed.

Sir Alan, who watched her keenly, saw no trace of the agitation of the afternoon; but once, when by chance her eyes met his, he fancied he read in their lustrous depths a shadow as of some deep sorrow. Later in the evening, when the little folk, "worn out with pleasure," had gone home to roost, and the real festivities began, although Sir Alan had his hands full, his scrutiny did not relax. He saw that among the male portion of his mother's guests Cora was a favorite, but he saw also that she gave to no one any mark of particular preference; that while she was kind and gracious to all, even his jealous watchfulness could detect nothing further. One thing, however, could not fail to escape his notice, namely that to one of the young men at The Bungalow Cora was the object of especial interest, and that wherever the girl moved, Ralph Graham's eyes followed her.

He was a handsome young fellow, of good family and good means; by no means a despicable rival: and when Sir Alan noticed the firm resolve in his frank mouth and honest blue eyes, he felt that he had made up his mind to know his fate, and that shortly. Nor was he wrong, for while he himself was engaged in an apparently desperate flirtation with Lady Flora Venue, who was a belle and a coquette to boot, he saw Cora leave the dancing-room, leaning on Mr. Graham's arm.

Lady Flora thought that her host seemed absent and *distrait* after that, and soon dismissed him for a gayer companion.

As he passed his mother, Lady Vincent stopped him.

"What a laggard you are, son Alan," she said smiling. "Don't let Cora accept another suitor in the meanwhile."

"If she loves him, I am willing," he said, moodily.

"Is it likely?" replied Lady Vinent. "Ask yourself, Alan, whether Cora loves anyone else after the scene you witnessed this afternoon. Only as the poor girl labors under a misapprehension, she might imagine that if she is not to possess the love she needs, it is her duty to make some one else happy, if she can."

His mother's words quickened Sir Alan's steps, and he passed through the dancing-room into the quiet, dimly-lighted conservatory. As he entered it, he met Ralph Graham on his way out; and even in the half-light he noticed the pallor which overspread the young man's face and the pain legible there. As he passed, Sir Alan felt, with a sudden sharp pang, that in a few moments he too might have a similar answer to his suit, and leave Cora "with a life-long hunger at his heart." He found the young girl sitting among the flowers, her head resting upon one little hand.

She started at the sound of his footstep, and as she looked hastily up Sir Alan thought he saw tears upon her face. Sir Alan sat down on the cushioned lounge by her side, and his thoughts flew back to an evening two years ago, to a quiet country house in a distant land—to a fair, pale girl, in sable garments, leaning against a broken marble pillar—to a bowed girlish head, and a broken voice saying:

"Not now, not ever!"

As he did so, his courage almost failed him; but the remembrance of Cora's face as she sat at his mother's feet that afternoon renewed his confidence. The girl was the first to speak; but her voice was a little husky, and her manner ill-assured.

"Our friends seem to be enjoying themselves," she said nervously. "I think everything is going on well."

"Yes," answered Sir Alan, absently. He was not much interested in the amusement of his mother's guests as he sat there by Cora, his strong white hand pulling nervously at his heavy moustache.

"My mother tells me that you are thinking of leaving her, Cora," he said, at length. "But as the guardian your brother gave you, I must seem impertinent, and ask your reasons for wishing to do so."

Cora trembled and for a moment could not find an answer.

"Have you not been happy here?" he continued, quietly. "I promised Harold to care for your happiness you know."

Still Cora did not reply.

"Well?" he said, gently.

"Lady Vincent told me you were going to give her a daughter," she said, with a quiver in her sweet voice. "She will not need me then."

"The second daughter will not take the place of the first," he answered. "She will always love you best."

The girl shook her head.

"That is not your reason, Cora," he pursued, unpityingly, although he saw that she was greatly agitated.

As he spoke he put out his hand and took hers into his. His manner was perfectly quiet, and for a moment Cora contrasted it with the passionate eagerness he had displayed in the interview with her at her brother's grave.

"Can you not give me the true one, Cora?" said the baronet, playing with the little fingers he held.

"No," the girl answered suddenly and almost fiercely.

"Ah, well, never mind," said Sir Alan; adding, after a few minutes' pause: "you have not wished me every happiness, Cora."

"I do—I do," she said eagerly. "With all my heart, I hope—I pray you will be happy."

"Thanks."

And Sir Alan bent his head over her hand; and touched it with his lips. Starting as if the touch hurt her, Cora withdrew her fingers from his clasp.

"Why do you take your hand away, Cora?" he asked. "I have offended you, have I?"

"Oh, no no!" she answered, quickly.

"Have you no curiosity to see my mother's daughter?" he said, as he repossessed himself of her hand. "Shall I introduce her to you, Cora?"

"If you wish," she answered, as if the words hurt her.

"Don't you care to know her? I hoped you would be good friends, Cora. Have you no interest in the girl I love?"

She was trembling violently.

Sir Alan smiled to himself, well pleased.

"Will you come to her now?" he went on, rising, and looking down at her from his tall height, his eyes full of tenderness, lingering over the lovely troubled face.

Cora rose, but her agitation was so great that she sank down again on the cushions.

"I am afraid you are not well," he said, gently. "I will get you some wine, dear child. Stay quietly there until I return."

He disappeared, and Cora's head fell forward on her clasped hands.

"How shall I bear it?" she thought. "I who love him, to meet the girl he loves!"

In a few moments Sir Alan returned with some wine, which he made her drink; then when she seemed calmer, he said:

"Shall we go, Cora? My darling is tired, and ought to be in bed. I don't want to keep her up any longer."

Cora shivered as he led her out of the conservatory, through the ball-room into the little sitting-room, which had been held sacred from the intrusion of any of the guests. To the young girl's surprise it was empty.

"There is no one here," she said, trying to speak lightly.

"Is there not?" he answered, softly. "Sit down here, Cora."

He drew her to a sofa, and sat down quietly beside her.

"I ought to have told you," he said, "that to make my engagement sure the consent of one person is lacking."

Cora was bewildered, and lifted wondering eyes to his face; but she saw nothing there to help her to read the riddle.

Sir Alan smiled.

"Yes the consent of one person. That person is yourself, Cora."

"Myself?" said the young girl.

"No other. Will you make me quite happy, and give it? Sisters have sometimes a word in their brother's choice, and I shall not be happy unless you approve of my future wife. Turn your head Cora she is waiting behind you to receive it."

Cora turned her head quickly with a nervous start, but the face she met as she did so was her own face reflected in a Venetian mirror which was fastened against the wall—her own face, which she saw looked pale and startled, and an undefined terror in her dark eyes.

"Well, dearest, do you like her?" said Sir Alan, softly, in a few minutes. "Will you say 'yes' to me, Cora?"

"This is a cruel jest, Sir Alan," said Cora, turning from him, and bursting into a passion of tears.

Sir Alan caught her in his arms.

"It is no jest my darling; it is all true. I want your 'yes' to complete my happiness. My mother knows that there is but one woman in the world for me, and without her love I cannot be happy. Is it mine, Cora?"

Cora's face was hidden in her hands as he held her in his arms, and no words came in answer to his eager question. Sir Alan waited; then he bent over her again, and in a voice, lowered to the softest whisper, he repeated it:

"Is it mine, Cora?"

"Do you really care to have it?" whispered Cora lifting her head, and looking at him with eyes very full of love, but as if unable yet to believe in her happiness.

"What do you think, my darling?" he replied, lightly. "Oh! my child," he added, passionately, "ever since I saw you first, it has been the wish of my life to win it. Are you sure, quite sure that you will give it to me?"

"I cannot give you what is yours already," she said, softly, resting her head against him with a sigh of perfect content; and as he bent over her and pressed his lips to hers, he said tenderly:

"My darling, my own love, now and ever!"

"Do you know how unhappy I was that night when you sent me away, Cora?" he said, after a long, happy pause. "It seemed as if the whole world had changed to me, and the sight of you seemed to hurt me. Something in a letter from my mother brought me home at last. She told me that as yet no one had seemed to find favor in Cora's eyes, and wondered why I had not courage to try again. When I came your distant manner almost reduced me to despair, but something in your dear eyes seemed to tell me that I might hope."

Cora's thoughts flew back to the past, to the hopes which had been hers when she first returned to England, and a chill fell upon the happy heart when she thought that she ought to tell Sir Alan of her love for Lord Almane. Must she tell him she wondered? Must she risk the love which was so precious to her? Not yet—not yet—she could not chance it yet. She would wait until she knew him better—until she was sure of the love he had given her, and then——

"You are very silent, my darling," said his tender voice, breaking upon her reverie, "and you are looking very tired. Shall I send you to bed?"

"Oh, not now, Alan," she entreated. "You have not danced with me once to-night."

"Let us have a waltz now, then," he said, smiling, as they returned to the ball-room; and Lady Vincent's eyes brightened as she saw their happy faces, and knew that all was well.

"How do you like my son's future wife, Cora?" she asked laughingly, as they paused near her. "Do you think you will get on together?"

Cora laughed and blushed, for Sir Alan's eyes met hers, full of laughing meaning.

"We will try not to quarrel," she said, gaily.

"You had better not," said the baronet, laughing. "I will allow no one but myself to quarrel with her; no one but myself to scold her; no one but myself to love her!"—To be continued,

THE COUNTRY COUSIN.

CHAPTER I.

"Now, girls, stitch away; there's lots to do yet, and none too much time to do it in. Here's the trimming to put on my dress, and the lace on Fanny's skirt, besides that white wreath to alter. Oh dear, how I do wish I could afford a new one!" said Sophy Harrison, with an impatient jerk at the flimsy fabric on her lap.

"Could I do anything?" asked a plainly dressed, quiet-looking young girl, who had been for some time surveying the scene in silence

"Of course you can," replied Sophy; "but it is a shame to set you on to work so soon. Besides, perhaps you have something to do for yourself?"

"Oh no, my dress is all ready. Shall I tack that lace on?" and without waiting for an answer, Maggie Cameron was soon working away as busily as the rest.

"What are you going to wear, Maggie?" inquired Sophy, after a pause, during which needles and thread had been swiftly flying to and fro.

"I have but two evening dresses with me," replied Maggie; "a white muslin and a blue grenadine. I will wear whichever you like."

"Oh not blue, I beseech you," said Sophy; "it would quite spoil the effect of my peach blossom. White will suit you admirably, and a red rose will look delicious in your dark hair."

"Frank Wilford is to be at the party to-night," said Fanny.

"You don't say so!" exclaimed Sophy, dropping her work with a sudden start; "I wish I had known that before, and I would have had a new wreath!"

"Ah, but Kitty Ansell is going, too," said Fanny. "So there's not much chance for you or anybody else."

"I don't know that," said Sophy. "At any rate it's no harm to try; and who knows what may happen. '*Nil desperandum*' is my motto. Are there any nice young men about your place, Maggie?"

"I don't know, indeed," said Maggie, laughing; "I go out so very little at home."

"Oh I forgot," said Sophy. "My aunt is very strict, isn't she, and makes a little nun of you? I should hate that. It is so charming to go to balls, and plays, and concerts; only one's obliged to cut and contrive one's dress, so, and that's horrid."

"You should have white muslin," said Maggie, innocently; "that always washes and looks new again."

"Yes, but that's as old as the hills, child," replied Sophy. "Nobody wears anything but grenadine and tulle, unless, indeed, one could afford lace. Now, the dearest wish of my heart is to wear a black lace—real lace, mind you—over pink satin. Oh, wouldn't it be heavenly! Lotty Stephens has one over amber silk—such a beauty!—but then she's going to be married, and can have anything. Heigho! I wish I was."

"There, that's done!" exclaimed Fanny, jumping up and throwing down her thimble; "make haste, girls, it only wants ten minutes to five, and we must be ready soon after eight. How long do you take to dress, Maggie?"

"Oh, about half an hour, I dare say," was the reply; "but——"

"Half an hour!" screamed Sophy; "hear her! Why I am going up now, and I shan't be ready one bit before the time. I shall be an hour, at least, doing my hair. What a little rustic you are, Maggie!"

Maggie's color rose; but she only said, quietly, "Mamma does not like me to spend so much time over my dress, cousin; so I shall be ready to help you, if you like."

"That's a darling," said Sophy; "so you shall for I want to look killing to-night, I can tel you."

The Harrisons were a large family, three girls and as many boys; and Mrs. Harrison and her daughters being excessively fond of show and company, it was almost as much as they could do to make both ends meet at the year's end, particularly now when the girls were all "out," and doing their best to get off. Their cousin, Maggie Cameron, who had been brought up in a very different way, had come to spend the winter with her aunt and uncle in the large, bustling town of Winterbury, where there was always plenty of gaiety in some shape or other the year round. The eldest Miss Harrison, Sophy, was nearly three-and-twenty, and her settlement in life was becoming a matter of very serious consideration, for visiting and late hours are not favorable either to eyes or complexions, and a fair beauty soon fades.

By eight o'clock on this particular evening Maggie was dressed, and down stairs long before the others, who, as is usual with young ladies on such occasions, were fully half an hour behind the time. At length, however, they all sailed in, dressed in the extreme of fashion, with their heads an elaborate mixture of frizzles, puffs and flowers, and their skirts so voluminous, that how they ever got into them must have been a puzzle to the uninitiated.

Maggie's costume was a decided contrast,—a plain white muslin, tastefully yet simply trimmed, and made, too, without that sacrifice of modesty in which young ladies delight at the present day, for it actually did cover the fair smooth shoulders, and really had sleeves, and not shoulder-straps. A single flower of deep velvety crimson nestled in the glossy brown hair, and a handsome pearl locket, suspended by a piece of black velvet round the throat, completed the simple costume.

Maggie had never looked so well. Her cousins surveyed her in silence, and only Sophia exclaimed, "My gracious, child, you've no bracelets, or bouquet, or fan, or anything! But it's too late now; make haste,—the carriage is waiting."

Maggie had never been at so large a party before; and the sudden plunge into so much brilliancy and fashion fairly dazzled her at first. But this feeling soon wore off, and the music was so exhilarating that she felt almost ready to dash off and join the dancers there and then.

"Does not your cousin dance?" inquired young Wilford, whom Sophy had successfully manœuvred to get for the first round dance.

"Oh yes, I suppose so,—I wonder mamma has not found her a partner," answered Sophy, not quite pleased at the inquiry.

"Perhaps you will introduce me," he continued, as the music ceased, and they found themselves nearly opposite Maggie, who was half hidden by Mrs. Harrison's satin skirts. Sophy complied, rather ungraciously, and then seated herself by her mamma, exclaiming that she was tired to death, and should like an ice of all things. Of course there was nothing to be done but to comply with her request, and offer his services to escort her to the refreshment-room, which afforded a delightful opportunity for a little quiet flirtation. Before they returned, Maggie had another chance of dancing; and, after that, she found no lack of partners for the rest of the evening, which passed away much too quickly for the fresh young girl, whose early bloom had not been sullied by any of those scenes of childish dissipation known as "children's parties."

"And how did you like the ball, Maggie?" said Fanny, as she yawned over a new novel the following morning.

"Oh, so very much!" exclaimed Maggie, enthusiastically; "and the music was perfectly delicious; it almost makes me dance now to think of it."

"You queer child," said Sophy, who sat resting her feet upon the fender; "I did not think it nice a bit, and the music was simply horrid.'

"Oh, but it was my first ball, you know, and it all seemed delightful to me," said Maggie

"I dare say you felt exactly the same at first."

"Oh I don't know," replied Sophy; "it is so long since my first ball that I forget all about it. I've gone to balls regularly these ten years, and really one gets tired of everything in time."

"Ten years!" exclaimed Maggie, in astonishment; "why, you must have been quite a child."

"Of course I was," replied Sophy; "twelve or thirteen perhaps, not more. To be sure they were only children's parties, but we used to go on pretty much as we do now, flirting and all, in a small way."

"Oh Sophy, how ridiculous!" exclaimed Maggie.

"Ridiculous!" said Sophy; "not at all. I'm sure I enjoyed myself then much more than I do now. It was so very delightful. But how do you like Frank Wilford, Maggie?"

"Oh pretty well," said Maggie, slowly, for she had not been very favorably impressed with the gentleman in question, who dropped his r's, parted his hair down the middle, and said, "No, thanks;" all of which were capital sins and offences in Maggie's eyes.

"Only 'pretty well,'" repeated Sophy; "why, he's the richest fellow in the place, besides being the best dancer."

"Well, you need think nothing about him, Sophy," said Fanny; "Kitty Ansell will take care of him, depend upon it."

"I don't believe a word of it," returned Sophy, pettishly; "but if he prefers her to me, why I hope he'll take her, that's all. There's as good fish in the sea as ever came out of it."

"Now that's a very vulgar saying," put in Harriet, who was the fine lady of the family; "and you only use it when you're vexed."

"I vexed, indeed!" said Sophy; "I'm not vexed. But if it comes to that, I think Maggie has almost as good a chance as Kitty Ansell. I'm sure he admired her, and he asked for an introduction; which looks suspicious, to say the least of it."

"Do set your cap at him, Maggie," laughed Fanny; "and cut out these other two girls. What fun it would be!"

Maggie looked from one to the other in silent astonishment, for she had never heard young ladies' "chaff" before.

"Look at her, how grave she looks!" said Sophy. "Oh, Maggie, what a little rustic you are."

"Well, but seriously, Maggie," said Fanny, "I should advise you to think about it. How nice to be the wife of Frank Wilford, Esq., of Temple Lawn, with carriages, and horses, and servants, and no end of money. Why, you would have a house in town, and an opera box, and go to no end of balls, and be presented at Court. Only think of it!"

"Besides making all these other girls, who have tried and could not get him, mad with rage and envy," chimed in Sophy. "Kitty Ansell would be ready to bite her fingers' ends off with jealousy. But dear me, how late it is! Do come and dress, girls. I declare I had almost forgotten the crysanthemum show, and some of them are sure to be there."

Maggie felt half inclined to refuse; but her uncle, who had taken quite a fancy to the quiet little country girl, would not hear of her staying at home; so she put on her "Sunday dress," a pretty gray merino, and went down stairs to wait for the others. As usual she was ready fully half an hour before her cousins, who came in radiant with the newest fashions.

"Why, Maggie," exclaimed Sophy, "you are surely not going in that plain French merino and felt hat? Why, you look like an Arcadian shepherdess."

Maggie colored slightly at this rude attack on her dress; but she only said, "Don't you think it will do, cousin? I have only got two light silks besides, and I thought those would be too dressy for morning."

"Too dressy, child! What nonsense!" exclaimed Sophy. "There's nothing too dressy in these days; but you don't understand such things. Never mind; nobody will notice you, I dare say."

But Sophy was mistaken; for somebody did notice her: and more than that, admired the fair, modest-looking flower; and all the more for the contrast she exhibited to the gorgeous blossoms beside her.

"Who is that young girl with the Harrisons?" asked young Hamilton, the most impassive and fastidious of all the Winterbury set.

"Haven't the faintest idea," answered his friend. "Wilford, do you know?"

"Yes, she's a sort of cousin, or something," he replied. "I danced with her at the ball the other night. She's a nice little thing enough, and rather refreshing after the usual run of girls; a sort of daisy, you know, amongst a cluster of exotics," and evidently thinking he had said something witty, Mr. Frank Wilford pulled up his shirt collar and deliberately lounged away.

In a few minutes the Harrisons, whose acquaintance had previously been of the slightest, had the supreme delight of receiving a very cordial greeting from Mr. Claude Hamilton, who by a dexterous movement contrived to place himself next to Maggie, and gradually drew her into the conversation. She had too much good sense to be bashful, but spoke with a quiet modesty, which contrasted very favorably with the sparkling chatter of her fashionable cousins; so that when Mr. Hamilton lifted his hat and said "good morning," it was with a determination to make a further acquaintance with the Harrison's country cousin.—[Concluded next week.

A COUNTERBLAST AT THE MARRIED FOLKS.

MARY DEAN.

To attack the married folks requires the daring of the boy who, probably hoping to see a free menagerie, cried out to a bald-headed man, "Go up, baldhead! Now fetch on your bears!" The married folks have had their own way a long time. They have managed affairs so that the women of our period are not so strong nor so happy as their right is to be. Now let the single rise up and protest.

Everybody loves power, women as well as men, but that natural love and source of strength is taken out of women by an artificial education, it not being considered suitable to married life. Men are as strong as lions, and women are naturally strong as lionesses; yet women are forced to become weak in order that they may be adapted to marriage. The attempt to put woman into perfect subjection to man has reduced her to a point where she is weaker than her task, so that she now performs her mission not in glad strength, but in shuddering dread and anguish. To be weak is nothing, but to be weaker than one's task is dreadful.

To suit married folks' notions, women are trained to the greatest possible feebleness and timidity—are not only trained to fear general enterprise and every undertaking that requires energy, but are also trained to fear little harmless things—mice, worms and beetles. So soundly are women grounded in this sort of education that those women who have native health and courage, and are naturally able to take the world on their shoulders and pad along with it, make believe to be afraid of little things, and refrain from their natural bent and turn lest they should look mannish and be thought to resemble strong-minded women who go straddling about on men's business. Girls' minds are ground down to a pale unanimity. They study too many books, like Watts on the Mind, Kames's Elements and Paley's Theology—works that were considered mediocre by the literary world when they were written, have never been read by reading people, and contain not a single thought that would not occur to the meanest capacity.

It would be well if we could imitate more closely the models on which our republic is founded. The Greek sister, the Roman matron, would be better models for us than are the women of Europe, still in feudal vassalage. How refreshing is the memory of Terentia, the wife of Cicero! Cicero said of her:—"Terentia meddles in affairs of government much more than she allows me to meddle in the affairs of our household." Happy Terentia! She had never heard of that round bore, woman's "sphere"—that circle destitute of money, and reeking with soapsuds and pancake-smoke. Imagine the effect if girls were trained to Grecian strength—to walk, for instance, with long, free paces, graceful as you will, instead of with these—oh, so irksome—mincing steps of to-day! Nature's strength is wasted pitiably now. Millions exist among us who with a strong education would have been self-reliant and thoroughly able, but who have been made objectless and terror-stricken creatures, that they might be manageable by men. Men want wives conspicuously inferior to themselves. The married folks think with Pinchwife in the old play:—"He is doubly a fool who does not marry a fool." A smart man wants a wife warranted not to be smarter than he is, and a dull man wants a wife duller than a great thaw. Disraeli's Lady St. Aldegonde is the ideal wife:—"Beaming with brightness, with a cloudless temper, she had from the first hour of her marriage concentrated all her intelligence on one object; and that was never to cross her husband on any conceivable topic." There you have it. "Beaming with brightness" and always agreeing! What sort of a person is this always-complying wife? She is an opinionless incapable: her household is without economy, her family is without subordination; she is the honeysuckle wife, who injures what she clings to, and her husband is early tired of her. Her beaming brightness does not last. Whether people marry or part, love soon comes to an end, and after that they have to depend for cheerfulness on health and a sound brain. A feeble-minded woman is not apt to be cheerful. Women, indeed, are not so cheerful as men: women depend too much on the success of others to be cheerful, and their unnatural weakness and apprehensiveness render them peevish, fretful and repining. Laborers returning at nightfall chat and laugh on the road, but at the threshold a sulky face silences them. Most married folks live like Giant Despair and his wife Diffidence in Doubting Castle. At the wedding they have eaten their loaf: nothing but the crust remains to them.

There is so much discomfort in wedlock, whoever wants to be happy had better keep out of it. To begin with, life is too interesting to be wasted in coquetries, and then men and women cannot live comfortably together. There is a possibility of content under peculiar circumstances, such as are seldom combined, but it is well not to run the risk. "None marries but repents," says the French proverb. "*Il y a de bons mariages, mais il n'y en a point de delicieux*," says M. le Duc de La Rochefoucauld. "Wife and child create for a man his deadliest anxieties," says De Quincey. "Family life has interminable chafing, deep anguish and horrible responsibilities," says George Sand. "'Twould be a pity, Trim,' quoth my uncle Toby, 'that thou shouldst ever feel sorrow of thy own, thou feelest it so tenderly for others.' 'Alack-a-day!' replied the corporal, brightening up his face. 'Your Honor knows I have neither wife nor child: I can have no sorrows in this world.'" People who mean to be happy had better fall into the procession with Tasso, Cervantes, Gibbon, Hume, Humboldt and Kant, and work, travel, read, write, talk and worship "whatever gods may be" in holiness and chastity, living a life of peace and free from care. Of course characters like Miss Fribsby in Pendennis, who had read novels until she was so absurdly sentimental that in her eyes life was nothing but one immense love-match, must marry. To such persons the entire universe—books, music, art, all forms, all perspectives, all illuminations, all horizons, all voices—have but one suggestion—marriage. Let them marry!

The married folks have succeeded in arranging society so that at present it is the business of spinsters to run with hot flannels, to stir gruel, to take care of house and children while the married folks go out, and to be thankful that they have flannels to heat, gruel to stir and other people's houses to take care of. Moreover, it is their strange doom that the flannels are never hot enough, the gruel is never stirred enough and the houses are never enough taken care of.

Now, our spinsters ought to do very different work. Let them get a few masculine ideas into their heads, and let them transfer their infinite system, sharpness and pertinacity from the "sphere" to some plane where work pays, and they will soon make a success of life; they will soon be able to live with retired leisure in trim gardens, and will enjoy what is dearer to woman than anything else whatsoever—pecuniary independence.

The test of ability is success. Three-fourths of all the men in the country are poor, but three-fourths of all the women engaged in business are not poor. Women make a success of business-ventures when they undertake any, because they are cautious, fond of accumulating and have inexpensive habits. Women are rich in the fewness of their wants if not in the abundance of their earnings. Small gains are to them competence. A man must have cigars, newspapers and a thousand other things women do not want.

A man cannot take out his old linen suits in the spring and rip them, make them over and do them up himself: he must buy new or go about looking ridiculous in his old ones. Neither can he make himself a new hat better than the hatter can. Women can, and they care nothing for newspapers. Clever women prefer old books to newspapers: they read not the Times, but the Eternities, like Thoreau. Let the spinsters strike out for themselves, and success awaits them. Let the vestals once start from the "sphere," and they will straightway become the peers of their brothers the bachelors, who are so proud of not being married, and do so congratulate themselves. No wonder!

Who'd be a married man,
Wretched and sad,
Looking like one who has
Gone to the bad?
I'd be a single man,
Jolly and free;
I'd be a bachelor
With a latch-key.

See what smart, managing widows some very stupid wives become. Legions of women with capacities for making fortunes, spend their whole lives in darning old carpets, dyeing old rags, gluing old chairs, cementing old crockery and benzining old grease-spots. In fact, three-fourths of the married women are doing it, being married to this huge majority of poor men; and very miserable they are. Besides, one woman in every seventeen is married to a drunkard. Look at that! There is no greater torture than what energetic women endure while waiting for odious lazy, unfortunate, poor men to provide for them. Poor, poor, thousand times poor woman! they wait on with hollow eyes and holes dug in their cheeks until too old to do anything but sit with their toes in the ashes of the pinched chimney-corner. Girls are not taught technical pursuits because they are expected to marry, but since most of them marry men of the sort who have nothing but their heart and lute to offer, both badly damaged and cracked, girls would certainly do well to learn trades and arts.

The married folks are always talking about "the crown of womanhood," as if it were something that might be lost in the battle of life, or if it might be knocked off and clapped on again and worn bent, like Betsy Trotwood's bonnet. It is a fashion with the married folks to say that women must stay at home minding the nest while men go abroad to get bread, just as mother-robins sit on the nest while father-robins go in quest of worms. As if there were any comparison between sober, industrious, vigorous robins and listless, debauched men! It is a lamentable fact that men in common do not play the robin role to an at all satisfactory degree, most of them being occupied in providing themselves with drinks and smokes. Now and then you find a genuine robin-man, but even he gives his wife what she wants so grudgingly it is not worth having.

Horace Greeley once wrote a regular married folks' pamphlet called The Ideal Man and the Ideal Woman, in which he sought to prove that woman ought to be contented, forgetting that the mere fact of her discontent proves something wrong. Greeley's ideal man performed great tasks with vast delight and in the most scientific manner. His ideal woman painted pictures, practised music and did housework, and was not in the least interested in the politics of the present nor of the mighty past, or in public affairs of any sort. She was a *petite morveuse*. You can imagine what sort of music she would play—The Battle of Prague, without putting any spirit even into "the groans of the wounded and dying;" and what sort of pictures she would paint—papery cabbage-roses and insufferable, horrid baskets of strawberries—upset, always upset. It would be dreadful to live in the same house with her, impossible to refrain from scolding her and abusing her pictures and music. Oh give me a woman of *nous*—one who loves dominion, and would grasp the ballot if she could from the tobacco-chewers and rum-sellers of this raw nation.

Don't begin to be tired: I am not. Woman sits like a dog at the table of man, taking whatever he gives her; and an impudent dog he thinks her if she takes it discontentedly. She depends on man for all she has. She is a parasite and an incumbrance in her own family. She would like a different arrangement, but is not allowed to alter things. Still she must endure contumely on account of this arrangement—men talk, books, newspapers constantly contain contemptuous allusions to her condition. This is vexatious. Men should be pleased with their own construction of society, though women are not; but men are not pleased with it, and they blame women for their own dissatisfaction. The man most anxious to keep women dependent is the most constant complainer about the burdens of domestic life: it is he who keeps up this perpetual growl about bills and extravagance. The man who is loudest in denouncing woman's rights is the identical individual who complains so of woman's silliness, incompetence and extravagance. You would not expect the man who with Mrs. Skewton wants "more heart," and not so much strong-mindedness around, and thinks the "sphere" big enough for any woman, to speak contemptuously of the "sphere"; but he does. He says there is no need of his wife's spending the money she does on housekeeping, and if she does not hasten to say she is tired to death at night, he wants to know what she has been doing all day, and why she has not done a multitude of other things. He declares she has nothing to do but enjoy herself. He accuses her of whining, he finds fault, with her weakness, he despises her incompetence, and yet he is furious when you aver that she ought to be as potent and self-sustaining as he is. People who strain at gnats generally have to swallow camels.

Now, then, let women adopt a new course. No longer standing in a meek row to be chosen, let them walk up and down the world as men do, taking possession of whatever they can lay their hands on, and asseverating, "There are no spouses worth having." I could say more.—*Lippincott's Magazine.*

MRS. HAYES IN PHILADELPHIA.*

M. W. F.

"Why not give Mrs. Hayes a reception?" asked a Philadelphia woman as every body was discussing the coming hither of the Presidential party. Somebody else said, "Why not?" and the enthusiasm to do honor to the large-hearted, level-headed Ohio lady who honors her country by being in the "White House," spread like a train of powder set on fire, and resulted in a most brilliant reception in the Academy of Fine Arts. Four thousand invitations were issued by the ladies having the matter in charge, and the Academy, already splendid with its "Spring Exhibition of Pictures," was rendered still more so by the profusion of flowers with which it was further embellished—lilies, roses, palms and ferns, and the grand stairway hedged with alternate groups of Astilbe Japonica and crimson Azaleas. Although there was one continuous stream of arriving people from (eight until eleven,) there was no confusion nor "crush." Philadelphia knows full well how to manage such affairs, and her women are "so capable."

Soon after eight o'clock, the band crashing a musical welcome, Mrs. Hayes made her appearance attended by a group of Committee Women, and the people made a wide way for her as she moved graciously, smiling and bowing, toward the place assigned her, which was canopied by a large bell formed of blush and crimson roses—a very individual-looking woman. Kind and matronly looking, too, and a face in which goodness and strength are, to an unusual degree, expressed and blended. She is of medium hight, "snugly built" (as the lamented Colonel Harris aptly described her,) with black hair dressed in a plain, old-fashioned way, and with a tortoise-shell comb at the back. Her frock was of white silk, quite elaborately made, but giving the effect of simplicity, and she wore crimson roses for ornament, and carried an immense bouquet of tea and Bengal roses, each half of solid sameness of color. Her manner is full of warmth and genuineness, and she had a real heartful smile for every person presented to her—no made-up, superficial gleam of brightness—and, considering the hundreds and hundreds that she had to smile on, well, she must have an inexhaustible fund of loving kindness somewhere.

An hour later the President himself arrived and "received" in another room—a fine-looking, ruddy-faced man, benevolent and kind, but with less strength of character manifested in his face. As he had held a public *levee* in Independence Hall in the afternoon and shaken hands with half the hands in the city, one could but sympathize with him in again being at the mercy of the awfully tiresome task of welcoming the people. But he set bravely and business-like about it. At one side of him stood George W. Childs, the Philadelphian so widely known for his great wealth and his great benevolence—a plain, Quaker-like looking man, short and somewhat stout, and looking very modest and practical. Near by was Governor Hartranft, a strikingly handsome man, and one of the few handsome men who "handsome does." As everybody invited had been particularly requested to come in evening dress, the spectacle was brilliant in the extreme. I was glad to see so many of the best men present, although wearing white neckties and white kid gloves, attired in frock coats instead of the immodest, ugly, ridiculous swallow-tail that has so long been *de rigeur* for full dress. Everybody will be glad to see it, as a fashion, dead and buried.

There was plenty of ice-water to drink—nothing stronger. Even at the Union League banquet wine was not served—out of deference to Mrs. Hayes. So much for a woman's influence!

But the best thing of all in the reception, was the triumph won by common sense, which it so splendidly illustrated, being given in honor of a very exceptional promulgator of that scarce article. Mrs. Hayes has demonstrated beyond all cavil that a woman may be in "high life" and still obey her highest principles and carry into execution her best impulses. The moral sense of a nation is nearly always right and will applaud good sense in preference to fashion, every time, if any one is brave enough to manifest the one instead of weakly yielding to the other. After the victory is once won, how comfortable one feels! It is the only way to be free—to do exactly what one feels to be the right thing to do. If Ohio has another such woman, let us pray that she may succeed Mrs. Hayes in 1880, as *President*.

* This should have appeared in our last issue but copy was not received in time.—ED.

BRIC-A-BRAC.

THE graduating class of the Woman's Classical and Bible College, Binghamton, N. Y., have presented Colonel Robert Ingersoll with their just completed text-book on Moral Philosophy, thanking him "for the greatly increased strength their religious convictions received from his recent infidel lecture in that city, and expressing the hope that when he stands up from time to time to ridicule the Bible, he may remember that they are praying for his speedy conversion to religion and common sense."

TO A COW.

WHY, cow, how canst thou be so satisfied!
So well content with all things here below,
So unobtrusive and so sleepy eyed!
So meek, so lazy and so awful slow!
Dost thou not know that everything is mixed—
That naught is as it should be on this earth,
That grievously the world needs to be fixed,
That nothing we can give has any worth,
That times are hard, that life is full of care,
Of sin and trouble and untowardness,
That love is folly, friendship but a snare!
Prit! cow, this is no time for laziness!
The cud thou chewest is not what it seems!
Get up and moo! Tear round and quit thy dreams? [*David L. Proudfit.*

THE English crown diamonds have arrived at the Paris Exposition, and are valued at $8,500,000. They are in a thick iron chest, and are guarded by sentinels day and night. There is a diadem of eighty-six diamonds of various sizes, in the middle of which is the celebrated Koh-i-Noor, alone valued at $320,000; also a collar of one hundred and eight diamonds, in the centre of which is an emerald, said to be the purest and most beautiful extant. A second diadem is a blending of diamonds and emeralds. In the center is the large Kaudavassy diamond, valued at $600,000. It would be rated at a higher sum were it not for a slight defect. These and many other valuables of the kind, belong to the English crown. A portion are used by the Princess of Wales on special occasions; the others are reserved for the Queen. The Kaudavassy was formerly the eye of a one-eyed Hindoo deity, and has been but lately added to the collection.

HOW SHE GAVE THE CENSUS.

WHEN the census-taker rapped at the door of a certain Detroit cottage on Crawford street the other day, and wondered if the woman would set the dog on him or douse him with dish-water, a great disappointment awaited him. She opened the door softly, snuffed the air to see if he smelled of lightning rods, and then threw it open for him to enter.

"Madam, I am making a canvass of the city," he began.

"Ah! sit down," she replied, and as he began opening his book she continued, "There are five of us in the family, and we paid $100 down on this place. My husband's name is Peter, his age is forty-two, and he came from a mean family. His father was always having lawsuits about dogs, and his mother was the greatest gossip in Elmira. Have you got that down?"

"My name is Alvina Sarah, and I was born in ——"

"I don't care to know where you were born, madam," he interrupted.

"Well, I care!" she exclaimed; "it makes a great deal of difference whether I was born in Africa or Boston, and I want it put down. As I was saying, I was born in Boston in 1838. Put down that I came of a good family."

"Madam, you don't understand—you—"

"Don't I understand that I came of a good family? I'd like to know of a Boston family which carried their noses higher than the Rogerses! Put down that my father was in the Mexican war."

"You have three children, madam?"

"I have'nt any such thing, sir! Put down that my mother was killed by an explosion in a quarry. Her mother and father were—"

"How many children have you, madam?"

"Have you got mother down?"

"No, madam. You see I am taking the census of the city."

"Well," she said, giving him a dangerous look, "I had the typhoid fever at the age of fifteen, and for weeks and weeks I hung on the edge of the grave. I bore up as well as I was able, and—"

"Five in the family—how many children?" he asked.

"Put down that I bore up!" she commanded. "And that one night when the watchers were asleep, I crept out of bed and took a drink of—"

"This is foreign to the subject, madam. How old are your children?"

"Haven't you put down that I hung on the edge of the grave?"

"No, madam."

"Aren't you going to?"

"No, madam. You see I am simply taking the census of Detroit. I desire to ascertain—"

"You can't ascertain it here, sir!" she snapped. "If my sickness which cost over $200, isn't good enough to go in the book, then you don't get a line here!"

"Let me ask you—"

"No use asking for any of our photographs, sir. If you get 'em anywhere and put our pictures in that book we'll make it hot for you! Good day, sir, good day!"

He stood on the step, sighing, and she called through the door—

"My grandfather was also bitten to death by an alligator, but I won't give you any of the particulars! You want to walk."

He passed on, sorrowfully wondering if the next woman's mother was blown off a bridge or carried down the river on a haystack.—*Detroit Free Press.*

SWALLOW-TAILS have been "disestablished" at the court of King Humbert as "too monarchical," and American callers are requested to appear in the more republican walking suit. What a delightful fellow the new King must be!

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

OLD LETTERS.

BY EDGAR FAWCETT.

WITH rosy ribbon's faded ghost to bind them
Long forgotten amid things we all forget,
In a chest of ancient souvenirs I find them,
Faintly scented from old crumbled mignonette.
And as now I slowly read them, solemn-hearted,
I imagine, with a vague, phantasmal dread,
That among their yellowed pages I have parted
The invisible ceraments of the dead!

Here are words that shine with sunny expectation
Of returning over sea to friends and home:
"When at last this gaudy Carnival's elation
Discontinues, we shall tear ourselves from Rome."
Like a brook the merry language ripples brightly:
Well she loved, that happy sister, what life gave!
Let me think how many years it is that nightly
Stars have glimmered on her lonely Roman grave!

Here is writing that I almost held as holy:
He was such a light of learning, Brother Ned!
Equal gentleman to lofty or to lowly,
With his candid Saxon eyes and golden head!
Father chided him too sternly, always crying
At his boyish college love for cards and wines!
Ah, how often I have dreamed I saw him dying
Far away among those Oregonian mines!

Here are leaves where still the soul of summer lingers:
Come to-morrow, love: the country is so dull."
Oh, the perfume of those cottage-door syringas,
And the twilight of the meadow's languid lull!
Oh, the fire-flies, with their dizzy glitters woven
Through the boskage of the copses dark and damp!
Oh the rapture while she gently played Beethoven
In the parlor where the moth was at the lamp!

It is lately as last August that I met her
At the crowded Newport ball, where I had strayed
One a widower of sixty-two and better,
One a dowager with feathers and brocade.
Was it fancy that sometimes looked severely
At her pretty daughter's partner in the waltz?
Could it happen that a meager income yearly
Was conspicuous among his youthful faults?

Drear momentoes of these disannulled affections,
Like the rays from planets that no longer glow,
With your tidings that are ghostly resurrections,
It were wiser to have burned you long ago!
Yet, alas! what wasting flame's intenser flashes,
With the reddest greed destruction can endow,
Could have made you the irrevocable ashes
That annihilating Time has made you now!

LETTERS FROM A COUNTRY GIRL.

MARGARET B. HARVEY.

WE girls could not do much with the chambers,—mamma had already arrayed them in snowy curtains and drapes and spreads, with, as in the parlor, light carpets as foundations. But we did hang up our drawings and wall pockets and cornucopias, relieving the whiteness.

Nowadays a great deal is said about the ceramic fever. Jars and vases are decorated with bright flowers and gay birds, many of them being really beautiful. Yet I do really think we ourselves had more than a glimmering of the art before it became fashionable. Certainly, so far as we were concerned, the idea was original.

For instance, we placed a large decalcomania rose in the bottom of a wash-basin, and on the fullest part of a pitcher, at equidistant points, four smaller sprays. The decorations were of the kind covered by a layer of gold-foil, which is hidden when the white paper foundation is drawn away. We used the sets constantly, the pictures not washing off for a long time and looking very pretty while they lasted.

Then we had some clear, solid, glass bottles of a very graceful shape, in which had been bears-grease. Having thoroughly washed and dried these until they shone like crystal, we placed on each a shepherd and a shepherdess, separated by wreaths of roses. Filled with water, these transformed vessels seemed the most appropriate, the most elegant things imaginable in which to start some slips of ivy.

As regards the outside of the house, we wanted flowers, of course. So we had to have, first of all, the fence thoroughly repaired. And when every pale was on, every hinge tight, every latch in working order, and all whitewashed, we found out that *some* farmers once in awhile forget,—that a good fence around a lawn adds, in a large measure, to its attractive appearance, even if nothing else is done to it. Then we talked about flowers and flower-beds.

Do we want Marigolds and Four-o-clocks and Lady-slippers? we asked. Will the old-fashioned flowers that delighted our grandmothers satisfy us? Are they not, after all, coarse and gaudy and common?

No, not altogether. They are dear to us because those dear to us have loved them. They are beautiful because our Father has made them. But we think the smaller portion of the ground might be devoted to them, a greater to those which will better meet our wants. For we cannot twine Zinnias at our throats and in our hair; we could not place a spray of Cock's-comb in a vase; we could not send a Sunflower to a sick friend. We will bring nearest to us what will do most good, not thereby ignoring what will do us less.

So, off at one side of the lawn, near enough to present a brilliant mass of color in the sunlight, not near enough to distract the attention from our more delicate favorites, were our old, homely acquaintances; nearer our door, to delight us with their exquisite forms, their fragrant odors, and their beautiful colors, were our Geraniums, Heliotropes, Mignonettes, Carnations and Pansies. Two distict classes. And as we have no strays from the one to the other, we did not bury any of our choice flowers among our common ones, nor did we overshadow our finer friends by any of our coarser ones.

I cite this because I would like some women to think of *littered* flower-beds that they have seen. Annuals and Perannials, choice and ordinary, tall and short, odorous and disagreeable, crowded together in one small space, so that searching for any particular flower is like plunging into a miniature wilderness. And once having thought of such a thing,—don't *have* it.

One place, right under the parlor windows, worried us. The ground was hard, yellow clay, shaded continually both by the house and the two large maple trees. We dug and raked and fertilized, and sodded and sowed grass seed. But it was all of no use. Half the summer passed away, and still nothing grew, and the bare patch was as bare as ever. At last we concluded, in very desperation, to cover the soil completely up. So the little boys with their wagons and the big boys with their wheel-barrows were dispatched in all directions for stones. More and more was ever the cry of the girls, as they piled them up, until at last the whole space was covered with a symmetrically-shaped *rockery*.

Boys and conveyances, girls and baskets. We soon had it filled with thick, black earth from the brookside, mingled with leafy soil from the woods. And then began our task of beautifying.

Ferns first. From the woods we brought the delicate beauties and crowded them into the rocks. In the center rose a tall, feathery Asplenium, while smaller fronds rose from the many crevices. The leaves of the columbine were still beautiful though the flowers were gone, and some of this we added. Down in the damp ground near the spring-house reveled the luxuriant wild Tradescantia, and much of this found its way to our stone-pile, to wreath around it. We were a little afraid that we could not succeed moving the plants so late in the season. But a day or two of slight rain helped us, and until late in the fall, we had a beautiful sight in place of the bare ground. And when in the following spring, our delicate ferns, our trailing vines, our graceful columbines came up again, we believed we had fully solved the problem of shady gardens. That is, first, good soil; second, plants that love the shade.

FIG. 1.

Talking of ferns and vines reminds me that there was at that time an obstreperous stump, that would get in our way. If we took it down to the bottom of the garden, it would surely get to the top. If we threw it over the fence, the boys or the dogs would bring it back. At last we concluded that something must be done, and the only thing we knew was, capture it. It was an odd, irregular little affair, all knots and holes and sharp points. We dug out the inside, filled it with earth, and planted in it a little fern, with a vine or two to fall over. We passed a leather strap through two holes in the back, and knotted it, forming a loop to hang it up by, which never showed. After awhile the fern and vine grew so that we thought our stump not fine enough for them, and undertook to varnish it. We sent little JULIA to the drug-store for dark varnish and she brought us—*black slack*. Not until we had our stump arrayed in sable did we discover our mistake. Oh, how bitterly we lamented our folly! At first it looked like honest wood' now, like soiled tar. But we "builded better than we knew." In a few days the black sank in, and some of the wood peeled off in places, and our improvised hanging-basket was beautifully mottled in black and ash-color. It was so pretty that we had it in the dining-room window all winter. The moral is if there are any old stumps about, and they are soft enough, dig into them, settle them somewhere, fill them with earth, plant something in them, and if you like (provided there are no natural markings like knots and patches of barks) vary them a little by a few touches of black.

There is no end to the pretty things that can be made by one in whom the inventive faculties have been stimulated and trained by familiarity with beautiful objects.

DESCRIPTION OF CUTS.

NO. 1.—FANCY BOX.—Take pasteboard for a foundation and cover it with pink or blue paper-muslin; over this plait white Swiss edged with Smyrna lace, finish with cording and a loop, and you will have a pretty and convenient addition to the toilet table. Be careful to turn the glazed side of the muslin next to the pasteboard.

NO. 2.—SET OF SHELVES.—This can be made of either White Pine, or Walnut. (If any difficulty is experienced with the curve in front, it can be omitted.) Cover the shelves with dark cloth, finish the three upper ones around the edge with gimp and small brass-headed nails, and ornament the lower one with a drape. The drape may be decorated with flowers—a small piece of brocade answers very well, or it may be painted or embroidered. If preferred, a small bunch of decalcomania flowers may be gummed on. Shelves so covered form an effective back-ground for the art collections which it is the pride of the house-wife of the day to own and to display.

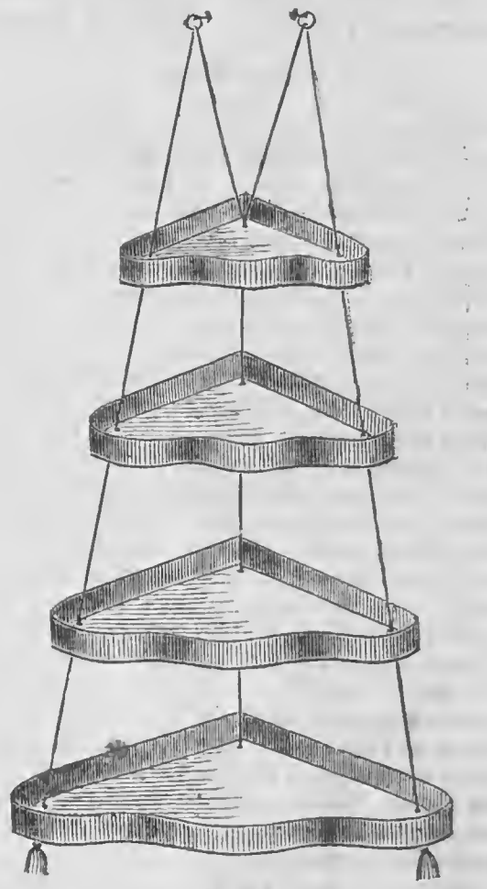

FIG. 2.

NO. 3.—SCREEN.—A round block of wood and a rod of wood or iron are the requisites for the frame. The screen itself is made of dark-green cloth with cording and tassels of green and gold. An embroidered butterfly ornaments the center. A novel device in screens is to inclose a piece of bright-colored silk between two pieces of perforated board, fasten the edges together with ribbon same color as the piece of silk, and ornament with pictures or embroidery.

WOMAN'S COURAGE AND DEVOTION.—During the whole of Lord Dundonald's arduous services and romantic adventures in South America, his wife accompanied him, to sooth his anxieties, to sustain his hopes, to animate his exertions, to share his dangers. One night, whilst he was in command of the Chilian fleet, his ship got becalmed under a battery, from which he was assailed with red-hot shot. His men were seized with a panic, and deserted their guns. If the fire from the shore was not returned, it would speedily become steady, sustained, and fatal. He went down to the cabin where his wife lay. "If a woman sets the example," he said, after telling her his difficulty, "they must be shamed out of their fears; it is our only chance." She rose and followed him to the deck. The first object that met her eyes was the battery, with its flaming furnaces, round which dark figures were moving, looking more like incarnate demons than men. A glance at her husband's impressive features, and

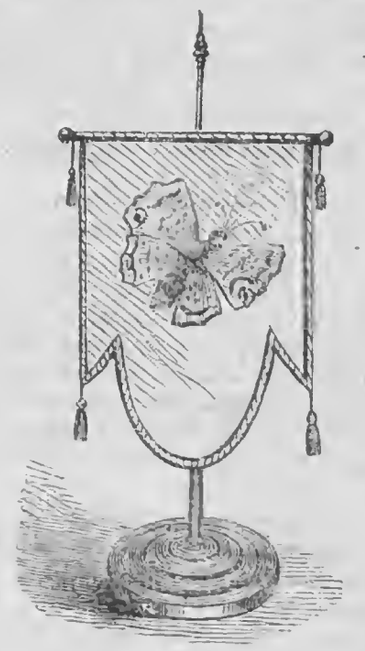

FIG. 3.

his "terrible" calmness, reassured her. She took the match, and fired a gun when he had pointed it. The effect on the crew was electrical: they returned to their posts with a shout, and the battery was speedily silenced.

TO CLEAN GLOVES OR SHOES.

MRS. J. E. S.

BUY one quart of benzine (cost ten cents) pour half a teacupful into an earthen dish, put in the gloves and squeeze with the hand until they are thoroughly cleaned. Wetting them freely does not injure the gloves, neither does it shrink them. After they are cleansed straighten them to shape, lay upon a clean cloth and put into a current of air to dry them and also to deodorize them.

White shoes are cleaned by rubbing them with flannel moistened with benzine.

THE extraordinarily low prices quoted in the announcement of LORD & TAYLOR in this issue for spring millinery goods and laces, embroideries and gloves, should secure the hearty patronage of our lady readers. These articles are latest importations. Their system enables all at a distance to purchase to as good advantage as those in the city.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

We have just been washing sheep-skins to make mats. They are, when colored nicely, a very comfortable covering for a floor, and as our living-rooms are of hard-wood ash and cherry alternate, and oiled, we dispense with the use of carpets and all their dusty results. The skins were rolled up fresh with a sprinkling of salt and saltpeter, and now we wash in strong suds to which is added a little kerosene and ammonia. When quite clean they were soaked a day in salt water with a little alum and then hung to drain. When about half dry, we called the boys to bring a ladder and they nailed them, wool side in, to a side of the barn where the eaves would prevent their being rained on. They will need some attention yet, for they must be rubbed well with alum and saltpeter, on the skin until perfectly dry. Then with a blunt knife all impurities must be cleaned off, and they must be rubbed with pumice stone. The skins are afterwards trimmed off, the tail sometimes left on, and lined with coarse toweling. They are pretty, durable and warm, as I have found when the children curled down upon them by the fire-side some cold winter nights. The tag ends and clippings, if pulled out fine, make good fillings for chair cushion or sofa pillow in constant use.

One of the problems of a household where there are small boys, is what to do with them in rainy summer weather. They cannot sit down quietly in the house if they are at all healthy irrepressibles, and when the steady pour, pour, comes where can they go? Happy then is the mother who, like myself, has a husband whose forethought has fitted up a pleasant workshop and supplied good wood, where they can practice and experiment. Something will come of it, and the natural mechanic of the family will surprise you with a specimen of his handiwork done "all my own self." Encourage him and praise his perhaps rough-edged efforts; he will do better next time. It is what every farmer should have, and it is a saving of money in the end to purchase tools and teach his boys how to use without abusing them.

WANTED—QUILT PATTERN.

I should be very glad of something new in the way of a pattern for what is called a variety quilt. I do not believe in cutting up whole cloth to sew together again, nor have I the time, but if I had I should put it to a much better use. I have, however, some pieces that were given me by loved ones who have passed on to the spirit land and I would like to preserve them by piecing them together into a quilt. Who can favor me with something more ornamental than the "flat-iron" shape, which is so common? If I spend the time to piece them, I would like something that will be pretty, and well repay me for my labor. Mrs. Mary Olin.

A STRAWBERRY CHAPTER.

Strawberry Shoo-Cake.

One quart of flour; a piece of butter the size of an egg; one teaspoonful of soda and two of cream-of-tartar; sweet milk to mix. Sift the cream-of-tartar with the flour; rub the butter thoroughly through the flour and dissolve the soda in the milk; mix soft and bake in a flat tin; when done, split open, butter and spread thickly with crushed berries, cream and sugar or berries and sugar only; spread fruit over the top or cream and sugar.

Preserved Strawberries.

Three-quarters of a pound of fruit and a pint of water to seven pounds of sugar. Put the sugar and water into a porcelain kettle and boil from seven to ten minutes according to thickness; then add the fruit previously washed and drained and boil four minutes; skim out the fruit; turn the sirup into tin pans and set in the sun adding the berries as soon as it is cool; let stand in the sun—protecting from insects—the sunny part of two days; put into glass and screw down; it is not necessary, however, to have them air-tight.

Canned Strawberries.

Fill glass cans with fresh, whole strawberries sprinkled with sugar in the proportion of one-half pound of sugar to a quart of fruit; put on the tops and *screw down at once* as tightly as possible; fill a wash-boiler with cold water, previously placing some old dish at the bottom—I have a perforated tin made to fit my boiler, which is a great improvement upon old plates, &c.—and stand in the jars. The water should be within two inches of the tops; when the water boils, note the time and boil twenty minutes; draw to the back of the stove; take out the cans and stand on a piece of flannel; screw down again and as the cans cool, causing contraction of the glass, turn down again and again until air-tight.

Strawberry Jelly.

Crush the fruit and strain through a coarse linen bag and to each pint of juice allow one pound of sugar; boil ten minutes, skimming as necessary; pour hot into jelly glasses and stand the glasses in the sun as for preserves for two days. Miss Cronk.

Spring Valley.

Strawberry Rice Cakes.

Boil one-half teacupful of rice; and when cold add the beaten yelks of three eggs; a little salt and one quart of new milk; then add the whites beaten to a froth; flour sufficient to make a batter and two teaspoonsfuls of baking powder; bake on a griddle and spread while hot, first with butter and then crushed strawberries and sugar; roll up neatly; cut off the ends; sprinkle with sugar and serve.

Strawberry Jam.

To six pounds of fruit allow four pounds of sugar; remove the caylxes; crush and put into a preserving kettle and cook one-half hour over a moderate fire stirring constantly; remove from the range and add the sugar; mix the sugar with the fruit, and again boil twenty minutes stirring as before. To tell when sufficiently cooked: take out a teaspoonful on a plate and if no juice gathers about it and it looks dry and sparkling, it has cooked enough. Every housekeeper should be provided with a miniature apple-butter stirrer for jams, &c.

Strawberry Short-Cake.

Sift two heaping teaspoonsfuls of baking powder with one quart of flour; add one-half teacupful of butter and lard mixed; one-fourth teacupful of sugar; a little salt and milk enough to make a soft dough; roll out quite thin and bake in two pans, which should be large enough to allow of the cakes being cut in half, so as to make four layers when done; crush the fruit if large and spread each layer, which should be buttered plentifully with berries and powdered sugar. Eat with cream and sugar flavored with vanilla.

Strawberry Sirup.

For five quarts of fruit allow twelve pounds of sugar and one pint of water; sprinkle the fruit with some of the sugar and let stand over night; then crush the berries, strain, washing out the pulp with the pint of water; add the remaining sugar and bring to the boiling point; again strain; bottle and cork at once; keep in a cool place. E. M.

DOMESTIC RECIPES.

Please give recipe for a good spring beer? Mary B.

Ans.—Boil one-half hour in two gallons of water, one ounce each of spruce, hemlock and sarsaparilla bark, dandelion, yellow-dock and burdock; strain and add ten drops each of oil of spruce and sassafras; when cold, add one-half pound of light brown sugar and a half cup of yeast; let it stand over night in a jar, cover tight, and in the morning bottle. This makes a very refreshing drink when iced and withal being healthy, purifies the blood and prevents billious. ess.

Crackers.

I noticed that a housewife wished a recipe for soda crackers. I send mine, knowing it to be good.

Take fourteen cups of sifted flour; a cupful of butter and lard mixed; a teaspoonful of soda and two of cream-of-tartar; a little salt and about two cups of milk. Roll thin, do not pound; cut into squares and prick with a fork. Bake in a moderate oven.

Egg Crackers.

Eight eggs; sixteen tablespoonfuls of sweet milk; eight tablespoonfuls of melted butter; mold with flour twenty minutes, roll thin.

Round Crackers.

One cup of sweet cream; one cup of water; a teaspoonful of salt and flour enough to make a stiff batter; pound and roll one-fourth inch thick. Aunt Katy.

News of the Week.

NEWS OF THE WEEK.

At home, the chief political talk during the week has had reference to the Florida disclosures, and to promises of other revelations equally shameful from Louisiana. An effort is being made in many quarters to belittle the odium that justly belongs to the rascals who confess themselves the chief instruments in perpetrating the frauds; but it must be remembered that by such nefarious means the suffrages of the entire nation may at each general election be nullified by the dishonesty of a few knaves; the expense and business derangement necessitated to bring out a full vote neutralized; and the very foundation of the Republic weakened. If they lied formerly, their proper place is the penitentiary; if they lie now, public execration is their due; in either case they deserve little credit and great opprobrium. The desire of making capital for the next election may induce Congress to investigate the matter, and in case the inquiry is full and free both Republicans and Democrats say they can make disgraceful revelations about each other—and very likely in this both speak the truth. President Hayes' title to the office will, however, hardly be called in question, for among the best authorities it seems the general opinion that that matter was definitely settled by the Electoral Committee—if not by the votes of the people. An effort is being made in the Legislature of this State to introduce the Meffet bell-punch register at any rate into this city, but it may be defeated by the union of two extremes, the blatant advocates of free rum, and the impracticable sticklers for teetotalism.

There has been a good deal of talk and some apprehension lately about the rapid spread of Communism. Bands of socialists are said to be drilling in Cincinnati, Chicago, St. Louis, San Francisco, and some other large towns and many threats of violence are reported to come from them. There is little doubt that the movement is growing in large cities, but in country places it seems to have no foothold. There is much distress and lawlessness in the land, and distress is always anxious for a change, while lawlessness is constantly on the outlook for a revolution, and the communistic movement is liberal of promises on both there points. The new organization seems to be rapidly affiliating with labor societies, and later on in the year, in the not improbable event of another strike, not a little public injury and bloodshed may result from the ill-omened union. Up in Montreal, Orangemen and Roman Catholics are still almost every week piously committing a murder or two and any number of violent atrocities in vindication of their own religious views and of the public conviction that prompt measures should be taken to suppress such disgraceful exhibitions of Celtic pugnacity and bigotry. The Mexicans, having been nearly a year without a revolution, have just started another, several towns as well as some guerrilla and robber chiefs having pronunciamentoed against Diaz and in favor of Lerdo. No public cause is assigned for the movement, but history shows that with Mexicans a revolution never needs a motive beyond the prospect of plunder and change. Escobedo and several pettier chiefs of the defeated faction, are enlisting forces in Texas, and will doubtless ere long cross the Rio Grande to increase the turmoil, unless again arrested by Uncle Sam's boys in blue. Away up on the Canadian frontier Sitting Bull is said to be inquisitive about the terms on which he would be permitted once more to enter the United States—peacefully this time. "Surrender of guns and ponies for cattle and farming implements" says Phil. Sheridan. The Great Mother is not so liberal with gifts to the Red Man and Brother as the Great Father, while her laws are more stringently enforced, and her soil and climate less conducive to the support and comfort of the wild hunters of the plains. On Wednesday May 1, John Morrissey at the time State Senator officially and gambler professionally, ex-congressman, ex-assemblyman, ex-prize-fighter and ex-rowdy, died at Saratoga much to the regret of all classes in the community—except perhaps a few jealous political opponents. Without the advantages of early education, respectable associates or respectable reputation, and with the drawbacks of his rowdyish, pugilistic and gambling professions, by sheer force of pluck, indomitable resolution, a good deal of rough manhood, and a good deal of non-professional honesty, he had proved successful in nearly every project he took in hand, and won the respect, good-will and votes of thousands who reprobated his professional career. Another noted character has also been cut down by death in the person of W. S. O'Brien, of San Francisco. Within a score of years or so he had risen from the position of a rum-seller to be one of the founders of the firm of Flood and O'Brien, the California Bonanza Kings. A quiet unassuming, liberal man—such is the reputation the old bachelor left behind him along with about $20,000,000.

Last Friday, Commissioner Le Duc had a pleasant little treat in Washington. A party of gentlemen who had been in India and Japan, and are well acquainted with foreign tea culture, plucked some young leaves from the tea plants in the conservatory of the department of Agriculture, deftly manipulated them and brewed some tea which was pronounced equal to the best from the imported article. Of course, a wholesale grocer now offers $1 a pound for the native sort—and would like in this way to get his name into print to secure free advertising. There is a report that Fenianism is again about to become troublesome in the event of war between Great Britain and Russia. Acting on the adage that "England's difficulty is Ireland's opportunity," and on the principle that if the mother can't be whipped, her child at any rate can be pinched and worried, a number of these bold warriors are said to be preparing for a raid into Canada, but only after the Canadian troops are out of the way, taking part in the trans-Atlantic conflict. Uncle Sam, however, having pocketed $15,000,000 damages for England's remisssness in allowing her territory to be made a basis for operations hostile to the Union, is not likely to render himself liable to similar penalty by permitting these mischief-makers to annoy or injure, from behind the shelter of his broad back, the inoffensive children of their ancestral oppressor. In preparation for a tussle with England, Russia is reported to be negotiating in this country for the purchase of a number of fast steamers to be metamorphosed into war vessels for the purpose of depredating on British commerce. Their crews will, so it is said, be composed mainly of Russian sailors, 600 of whom are reported to have arrived in American waters on board the Cimbria, which has been chartered for a year as a Russian transport, and is now off the coast of Maine. Until war is actually declared, our government can take no action in the matter; afterwards to preserve neutrality according to its own principles, it is in honor bound to take reasonable care to prevent the sailing of such craft. In olden wars "letters of marque" used to be issued to private ship-owners, authorizing them to fit out privateers, the crews of which were responsible only to the owners who paid to the Government that commissioned them a percentage on their captures. This system was abolished by European nations by the treaty of Paris, in 1856. But the sea may still be covered with mercantile vessels converted into men-of war, provided their officers and crews are responsible directly to the Government whose commission they cruise under, and are bound by its maratime laws and regulations.

On the 3rd inst: the House passed an amendment to the appropriation bill, increasing the salary of the Commissioner of Agriculture from $3,000 to $4,500 and also increasing the compensation of the different officers of the department to the amount allowed by law. The appropriation for collecting agricultural statistics was increased from $5,000 to $10,000; that for the distribution of seeds from $70,000 to $75,000. The representatives of the nation are beginning to feel they can no longer entirely neglect the agricultural interest—the world *does* move, colored parson Jasper, of Richmond, notwithstanding.

Manufacturers of Ladies' Suits, that use the Davis Vertical Feed Sewing Machine, are doing the sewing in the most elegant manner, and entirely without basting, or showing the stitches, by the use of very simple attachments. The invention and introduction of the Vertical Feed is an invaluable addition to Sewing Mechanism. The old under-feed machines will be rapidly superseded by this new and more perfect device for sewing, as it is adapted to every variety of work. The Davis Sewing Machine Company are building an addition to their large manufactory at Watertown, New York.

THE MARKETS.

PRODUCE AND PROVISIONS.

New York, Saturday, May 4, 1878.

Beans and Peas.—Receipts of beans have been unexpectedly let loose and though about last week's figures are repeated sellers are not quoting them with previous confidence. Mediums have merely the small spring call, buyers preferring the best selected stored. Cuba promises to be a better buyer of mediums, exporters however do not follow late advices with animation; they would rather wait until there is a decided development in their interest. Pea beans a better inquiry and prices are stiffer. White Kidneys are improving with the stronger phase of marrows; they take the place of marrows for some W. I. use Red Kidneys steady. Green peas $1.05@1.10, dull. Southern B. E. p as two bushel bag $2.80@3. Canadian peas 83@84c. for late business in bulk and bond.

We quote:—Beans, medium choice, $1.65@1.70; fair to good, $1.50@1.60; marrows, free to vessel $1.85@1.87½; fair to good, $1.70@1.75; pea, $1.40@1.65. White kidney, $1.50@1.75; red, $2.10@2.40; Black (Turtle Soup) $2.50@2.60.

Beeswax.—A small trade is in progress at 27@28½c. for Western and Southern.

Butter.—For many years past it has been the custom of dealers in State to hold up prices until Western yellow compelled the marking down. This season however is a prominent exception particularly as State grass butter will precede Western many days—a circumstance out of commercial record. During the past week it has seemed that sellers could not reduce prices fast enough or low enough to work off the liberal supplies of white. In fact State yellow is already moving sufficiently to endorse its early arrival in quantity as sellers are nervous with reason. They know that just as soon as pasture shades present any collected array, white must retreat into doubtful quarters. Hence we give a range of prices this week that are liable to fluctuate further in buyers' favor before we go to press.

Comparative receipts and exports for past five years:

	Receipts, pkgs.	Exports, firks.
June 1, '77, to May 1, '78...	1,170,768	173,430
June 1, '76, to May 1, '77...	1,160,969	148,988
June 1, '75, to May 1, '76...	1,549,973	33,059
June 1, '74, to May 1, '75...	951,036	49,388
June 1, '73, to May 1, '74...	923,016	32,052

State creamery, choice 21@22c., other 18@20c.; half tubs and pails selected, 19@20c.; other 14@18c.; Welsh best 18@19c; other, 14@17. Western, creamery finest, 21@22c., other, 18@20c. dairy choice 17@18c. other, 12@15c.; factory fair to prime 10@14c.

Receipts for the week 24,085 pkgs.
Exports past week 2065 pkgs.

Broom Corn.—Has a lighter sale.
Quoted at 6@7½c for hurl and short brush; 5@6½c. for medium green, 4@5c. for red and red-tipped, ₩ lb.

Cotton has been very dull and fluctuating sharply closing as follows:

Latest prices are 10.89c for May; 10.90@10.91c. for June; 11 11.01c. for July; 11.03@11.04c. for August; 10.73@10.74c. for September; 10.56@10.57 for October; 10.45@10.47c. for November; 10.45@10.46c. for December; 10.55@10.57c. for January; 10.64@10.66 for February; 10.74@10.77c for March, and 10.81@10.83 for April.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texa*
Ordinary	7 13-16	7 13-16	7 15-16	7 15-16
Strict ordinary	8 9-16	8 9-16	8 11-16	8 11-16
Good ordinary	9	9	9⅛	9⅛
Strict good do	9⅛	9⅛	9⅜	9⅜

Fair	12 5-16	12 5-16	12 7-16	12 7-16

Stained,

Good ordinary, 7 13-16c. Strict ordinary, 8 9-16c.; Low middling, 9 1-16c.; Middling, 9 11-16c.

Cheese.—Exports for the week 21,300 boxes. A steady decline has been necessary all the week to keep the increasing supplies sold up. The factories are now all at work, and larger supplies can be looked for right along: with this in view, exporters except as they get favorable terms do not exceed in purchasing actual needs. The closing market is weak, and 12 the best price for fancy factories while stock a trifle off is decidedly under this at once, very good grade being available at 11c. Prices are:

For new 12c. for best lots 11@11¼c. for good 9¼@11c. for half skimmed, and 5½@7½c. for whole skimmed. Western at 11¾@12c. for fine; 10½11¾c. for good prime, and 5½@7c. for skimmed.

Comparative receipts and exports of cheese have been as follows:

	Receipts, pkgs.	Exports, firkins.
June 1st, '77 to May. 1st, '78	2,382,574	107,182,534
June 1st, '76 to May. 1st, '77	1,960,641	81,210,670
June 1st, '75 to May. 1st, '76	2,348,549	95,307 211
June 1st, '74 to May. 1st, '75	1,966,540	98,236,840

Exports for the week 23,426 boxes.
Receipts, 28,893 do.
Liverpool cable, (old cheese) 64s.
Gold closes 100¾.

Dried Fruits.—There has been only a moderate jobbing trade, with prices, however, generally steady.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; unpeeled halves, 4½c.; quarters, 4c. Pitted cherries,

choice new, 23@25c.; Raspberries, 27c. New York State plums, 13@14.; southern plums, 11@12c. Blackberries, 10½c. Apples—State quarters, 4½@5½c.; do. sliced, prime, 6@7c.; Western quarters, 4@4½c.; Southern at 6@7c. for prime sliced, 5@5½c. for fair to good; Southern quarters, 4½@4½c.; Tennessee quarters, in bags, at 2½@3½c.; prime and fancy North Carolina sliced at 8@12c.

Exports for the week, 350 bbls. dried apples.

ESSENTIAL OILS.—Peppermint in tin, $1.75@2.00; glass, $2.50@2.70; Wintergreen, $1.90@2, large pkgs.; small, $2.10@2.15; Sassafras, 42@45c.

EGGS.—Receipts for the week, 9,963 bbls. The market is gradually working up from its late depression; still rates will have to be kept more or less popular until the danger of accumulation is passed. Receipts are favorably moderate.

Near points, 13½@14c.; State and Penn., 12½@13c.; Western and Canadian, fresh, 12c.; poor or inferior held stock, 10@11c.; Duck, 14@15c.; Goose, 27@28c.

FEATHERS.—Choice white goose, picked, 45c.; mixed, 40c.; scalded, 35c.; duck, 20c.

FURS AND SKINS.—Late sales at Leipsic developed nothing favorable for our home market, and the recent table of prices is only nominal.

FLOUR.—Has been declining, in sympathy with wheat, and closed weak except for Minnesota grades, which held higher on account of the destruction by fire of several more important mills in Minneapolis.

Latest prices are $4.15@4.75 for poor to fancy superfine State; $4.80@5.15 for poor to good extra do; $5.15@5.50 for good to very choice do.; $4.15@4.75 for superfine, Indiana, Iowa, Michigan, Ohio, &c., (the latter an extreme); $4.80@5.10 for inferior to good shipping extra do., (mainly at $4.90@5.05 for lines); and $5.15@5.50 for good to choice extra do.; common to choice white wheat extras, $5.35@6.50; choice to fancy do. at $6.50@7.50; red and amber winter wheat, inferior to choice trade and family, at $5.15@6.35; round hoop Ohio at $4.85@5.25, and trade and family brands of do. at $5.35@6.65, the latter rate for very choice; St. Louis, $5.25@6.00 for very poor to good extra, and $6.00@7.00 for good to very choice (with a few brands of fancy quality quoted up to $7.25@7.50); Minnesota clear, very inferior to very choice at $4.20@6.00 (a few fancy brands selling as high as $6.15@6.25); Minnesota "straight," inferior to very choice, at $5.75@6.75 (few brands going above $6.50, and patent poor to fancy choice at $6.00@8.75; unsound stock at from $2.25@5.75; city mill extra at $5.10@6.15 for fair to very choice for West Indies; do. for England at $4.85@5.00; do. trade and family extras, $6.35@7.50; do. for South America, $6.30@7.25 for fair to fancy; No. 2 at $3.85@3.75 for inferior to very choice (fancy lots held as high as $4).

FRESH FRUITS.—Apples are scarcely in stock enough to quote by. Red and extra Russets nominally $5@6 ₱ bbl.; poor to prime Russets, $3.00@4.50. Strawberries arrive from several points, and Maryland will be added next week. Norfolk, good to best, 20@30c. per quart; fair 15c.; North Carolina, 20@30c.; Charleston, 20@30c., inferior, 5@15c. Cranberries have closed out as a prosperous crop; a remnant of crates, $4. Peanuts still lack their wonted spring demand; prices weak. Va. hand-picked, $1.35@1.40; good to fancy, $1.15@1.30; common, 85c.@1.00. Black Hamburg grapes (hot house), $1.75@2.00 ₱ lb.

Receipts of peanuts, 1,475 bags.

GRAIN.—All articles have declined on account of the pacific character of the news from the other side, closing with an active business. Latest sales of wheat are:

New York No. 2, red at $1.32@1.33; red State at $1.32. State steamer white at $1.39, prime white State held at $1.45 and $1.48 offered; No. 1 white at $1.39@1.40. No. 2 Toledo red at $1.32; No. 3 red at $1.26½@1.27; ungraded red western at $1.10 to $1.35; No. 2 Milwaukee spring at $1.24@1.24½; No. 2 Chicago spring at $1.22½@1.23; New York No. 2 spring at $1.22@1.23½; ungraded spring at $1.18@1.22½; New York No 2 red, June delivery, at $1.31½; No. 3 Milwaukee spring, May delivery, reported at $1.23½; New York No. 2 spring, May delivery, at $1.22@1.22½. do. June delivery, at $1.21½@1.22; No. 2 northwest spring, May delivery, at $1.23½@1.24, do., June delivery, on private terms, quoted at $1.23. Rye at 71@76c. for State and 72@73c. for Western Corn—New York No. 2 brought 51½@51¾c.; do. old, 55½@56c. New York No. 3 at 50@50½c.; New York steamer mixed, at 52@52¾c.; low mixed at 54c.; ungraded mixed at 48@57c., and yellow southern and Pennsylvania at 51c.; No. 2 May delivery, at 52@52¾c.; No. June delivery, 52½@53¾c.; No. July delivery, 53¾c., steamer mixed May delivery, at 50c.—Oats, No. 2 Chicago at 35@35¼c.; white, State about, at 35½c., do., in lots, at 35½@38½c.; mixed and white State together at 35½c.; mixed State at 34@35½c.; white Western at 35½@39c.; mixed Western, 34@35½c.; New York, No. 1 white at 38c.; New York No. 2 at 35½@35½c.; New York No. 3 white quoted at 34½c.; New York No. 1 at 35½c., New York No. 2 at 34½c.

HAY AND STRAW.—Receipts have been moderate and prices very regular.

Bale hay, 55@60c. for shipping, and 70@80c. for retail qualities; clover, 50@60c. for prime. Straw, 40@50c. for long rye; 35@40c. for short rye, and 40@45c. for oat.

Exports for past week 618 bales.

HOPS.—Shipments the past week have reached 960 bales. There has also been a freer demand from brewers. Low and irregular prices have been accepted and the position is wholly nominal.

New Yorks, good to prime, 7@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

MAPLE SUGAR.—It is too late to ship cakes. The remnant brings 8@10c.; sirup has some demand at 75c.@100 per gallon with can.

OIL-CAKE.—Western quoted at $30.50 per ton.

PROVISIONS.—Hog products have been weak, reaching the lowest prices yet, and dull.

Mess pork, $9.75@10.00 for spot lots; $9.50 for June and $9.57 for July. Bacon at 5c. for long clear and 5¾c. for short clear. Lard—Western steam, 7.20c. for spot, lots, 7.20c. for May, 7.22½c. for June and 7.27½c. for July. Stearine, 7½c. for prime. Tallow, 7½c. Beef—New extra mess, $12.@12.25; plain, $10@11.50; packet $13.50@14.50 family mess, $15@16; extra India mess $25@26 for city brands; do. Philadelphia, $22@23.

POULTRY AND GAME.—Live poultry has a ready sale, the market trade prefers any bright city killed, to ice packed country dressed. The few lots of the latter go to hotels and steamers. Live fowls seldom run as steady in prices as they have during the past week. Spring chickens are mostly too small to be attractive.

We quote N. J. and Pa. fowls, 13@14c.; Southern and Western, 12@13c.; Roosters, 7@8c.; S. chicks, 50@90c. ₱ pair; Turkeys 12@14c.; Ducks, choice, $1@1.12; other, 50@87c.; Geese, N. J., $1.25@1.50; Southern and Western, 60c.@$1.

Dressed poultry is quoted at 15@17c.; for good to prime turkeys, 10@12c. for poor or extra heavy. Dry picked Philadelphia fowls 14@16c.; New Jersey, 12@14c.; odd lots of State and Western, 10@13c. for fair to prime. 8@9c. for poor. Capons, 28@30c.; slips, 25@27c.; spring and winter Philadelphia chicks, 25@30c.

Game is scarce and without special inquiry. Stall-fed pigeons are the new feature, selling at $1.50 ₱ doz.; flight, 75@85c.; squab, 75@85; English snipe, $1.90@2.; plover, $1.50; Sand Snipe, 45@50c.; Philadelphia squab, $2.50@3.

SEED.—Grass is dull but firm; clovers quoted at 7¾@7¾c. for State and 7¾@7¾c. for Western; Timothy at $1.30 to $1.40.

TOBACCO.—Is essentially as last week as respects prices. More interest is shown by exporters and the general trade is fairly active.

KENTUCKY LEAF.

VEGETABLES.—Export potatoes now arrive more or less soft or sprouty, and the extreme is seldom made. Choice Peach Blows and Early Rose bring $1.50@1.62; others $1.00@1.28 and many offered at 75 without bbl, a good deal of stock is offered at 75c. in bulk and 100@125 in lbs. Florida new $3@6 lbs. Bermuda, $7.50@8.00. Sweet have kept elegantly this season and Delaware bring $1.75@2; onions have advanced largely and suddenly; Red and Yellow $2@3; white $3@3.75 all Eastern. Chester new higher $2@2.50. R. Turnips 75; carrots 75@1.00; Green peas, crate 50@75c. Norfolk and N. C. now lead the trade range per bbl. 4.50@7.00; string beans low 4.50@5; Fla. do. $1.@2; cucumbers $5@6; Asparagus is in large supply Oyster Bay 3@3.50 N. J. and Del. $2@2.75; Southern $1@1.75. Radishes 50@1.25 per L. W. Kale old 20@25c. Lettuce bbl. 2@3.50. Cabbages, Norfolk, bbl. $2@2.50. Spinach bbl. $1.@1.25.

WOOL.—There has been a dull stupid market through the week, the trade holding off for the new clips, and business possible only at easy prices.

LIVE STOCK MARKETS.

NEW YORK, May 4, 1878.

BEEVES.—Receipts for the week, 10,277 head; do., last week, 10,600 do. "Moving day," which usually interrupts city business in meats did not have its customary effect this First of May. At both yards a steady sale of cattle is noted and prices at the close higher than on last Wednesday. Choice steers brought 10½@10½c.; ordinary to prime, native steers 9@10c.; bulls, 3½@4¾c.; Cherokee, 8½c. Export demand steady.

COWS AND CALVES.—Few arrive and few wanted unless extra. Milkmen would pay 50@65c, but the quality they want are worth as much at home.

VEAL CALVES.—Receipts have been liberal and prices are easy; good to prime, 5¾@6¾c. Buttermilk, 4½@5½c.; common, 3@4c. Hog-dressed veal has no reliable rate, the weather has turned very warm.

SHEEP AND LAMBS.—Receipts for the week, 20,539 head; do. last week, 18,517 do. Market inactive, quality somewhat against quick sales; fair to good clipped sheep, 4¾@5½c. do. unclipped, 5½@6c.; good to extra lambs, 8½. 10¾@11c.

SWINE.—Receipts for the week, 30,390 head; do. last week 25,397 do. No late sale of live; sold Thursday, $3.65@3.75, good corn-fed. Country dressed dropped.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S
ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

PULVERMACHER GALVANIC CO.,
Cor. Eighth and Vine Sts., CINCINNATI, O.

☞ *Avoid bogus appliances claiming electric qualities. Our Pamphlet explains how to distinguish the genuine from the spurious.*

USE THE PERFECT BUTTER COLOR!

WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

Reading for the Young.

BABY MARION IN CHURCH.

BABY Marion went to meeting
To hear her grandpa preach;
"Tis 'Tismas time, I must be dood,
I mustn't laugh nor skeetch.

"I've got my new boo dess on,
And my petty feddered hat,
And my han'chief in my 'ittle muff
That's like Aunt Jane's white cat."

So Marion went to meeting.
As a rosebud sweet and fair,
She piped up in the singing,
And bowed her head in prayer.

She waved her wee lace handkerchief
To her little playmate Grace,
And tried to wipe a sunbeam
From off her mamma's face.

She threw kisses to a lady
Who sat across the aisle;
Gave Dr. Meade some candy,
Which made the Deacon smile.

She climbed upon a footstool,
Whispering, "Danma, ain't I tall?
I wish danpa'd look down here,
But then, perhaps he'd fall."

Then Marion went home again
And jumped on papa's knee;
"'We all have been to meetin'
'Cause we are dood, you see.

"'And danpa preached: 'A 'ittle baby
Slept in the barn with cows;
And men came and div him presents,
And then they made him bows.'"

[*Christian Register.*

THE article on "Pocket Money for Young People," which appears this week is the first of a series which I hope will prove not only interesting but of real value to my young relatives. There can be no reason why the farm and home should not become places of absorbing interest to young people, and not the sources of discontent that, unfortunately, is too frequently the case. It is intended that these articles shall be practical in scope, and show the way to the profitable employment, for their own account, of the superabundant energy of our young agriculturists. Mrs. Jack's article will be followed by others from her own facile pen, in addition to the contributions from writers whose experience makes them trustworthy teachers. The incentive, pocket money, is secondary. It is hoped that experience, self-reliance and the formation of habits of observation will be the finer fruitage which will fit the young farmer to prosecute with increasing intelligence as he grows older, one of the most complex, least popularly understood of the sciences, farming. If more detailed information is requisite by those who propose to try for "pocket money," any questions bearing on the subject will be cheerfully answered by UNCLE TRUE.

POCKET MONEY FOR YOUNG PEOPLE.

ANNIE L. JACK.

GARDENING! The bright May days bring fresh energy, and the desire to plant and sow that we may reap, becomes an epidemic with us. For years the children have had each their plot of ground where they grow whatever they choose for pleasure and profit; and an apple tree, the fruit of which is all their own. But during the last few years these ambitious boys and girls have required wider scope for their increasing needs as regards pocket money, and take part of the garden for different crops as they may determine on "opening day." For the first day of seed sowing is really an era in the year, and of course the whole family must assemble to assist by advice and labor.

We proceed to divide the land, laying off the hillside into ridges. Jamie wishes to try

SQUASHES,

of which we have plenty of seed of June Hubbard, procured from Gregory. He knows that we can sell them in autumn to advantage, and also that the seed, if carefully washed and dried, sells to the seedsmen of the city, who take our word for it that they are not *mixed*. Seventy-five cents a pound will pay Jamie well for all the labor expended, which is hoeing the hills and keeping off the squash bug; for the work is chiefly done by horses, the hills being eight feet by six apart. But in winter he will have to clean the seed, and to watch that mice do not eat them before marketing. These are slight cares for a boy of ten who can easily realize *a dozen dollars from a small plot of ground*.

Our twelve-year-old daughter perseveres in

SAGE,

and all the savory herbs. The ground must be raked fine and seed got in early, for it takes quite a while to start; but there are dollars in a sage bed, and since it has been recommended as a *hair restorer* it is in greater demand than before. When cut at the right season, and neatly packed in boxes for market, it brings about $1.50 per hundred bunches, and, if kept over until spring, often double that price.

Willie thinks he will stick to

POTATOES,

although they are just now a drug on the market. Last spring the crop of the previous year sold at nearly a dollar per bushel, while this spring thirty cents is the average.

It so happened that late in June, 1876, there was a piece of grass land which we intended as a future bed for small fruits. So the boys took it from papa on shares and planted potatoes on the sod,—the work being satisfactorily done,—even little six-year-old trying his best to put in a few rows for pocket money. Long before the shoots were seen above ground, the land was harrowed, then on the appearance of the shoots the cultivator was run between the rows, the hoe applied, and by a little attention weeds were kept down and a fine crop of potatoes the result. In autumn papa refused his *share*, and the boys counted joyously 120 bushels of fine, large, Early Rose potatoes put into the barn cellar, where they kept firm and sproutless till the following spring, at which time they were well rewarded for their industry. How many things were bought with *potato money!* gifts to us and to each other, a trip to the city with money in the pocket, and the eldest ambitious youth gave his order to the cabinet maker, with an air of supreme importance, for a brand new cabinet—long coveted—in which to keep his collection of insects.

The family poet cultivates

FLOWERS,

not for sale as bouquets, but one ridge of ground is given to the growing of ornamental grasses and Everlasting flowers, and this is the poet's province,—with an eye to money making. The flowers are as simply grown as any of the annuals, and must be cut frequently, which is pleasant employment. They are hung in a dark room, head downwards, the stalks tied together in little bunches, and here they remain until early December, at which time we collect in the woods the various Lycopodiums, and use the flowers in the tasteful arrangement of winter decorations for Christmas. Poetry, good taste and close working for a fortnight, will result in a fine assortment of wreaths, crosses, stars and sprays. These are put into barrels and sold to city dealers at the rate of seven or eight dollars per barrel. Two years ago, by constant application through the last two weeks of December, three little girls of this household made six barrels of this trimming, and thoroughly enjoyed their well-earned pocket money.

Next week I will tell you of other things we have tried in vegetables and fruit and found successful, for the simple reason that we did not shirk, and were not afraid to work.

THE PRIVATE HISTORY OF AN EAR OF CORN.—No. 2.

BY THE COB.

THE worst member of a family is commonly held in the most affectionate esteem. We always have the redeeming qualities of a prodigal placed in the most attractive light, while the faithful, trustworthy, elder brother remains in a sort of trance of perpetual goodness and no praise accrues to him. It was so with our poor sheep. JOHN was always full of spirit. It proved his destruction, alas! When he parted from me he dropped his warlike title and became plain Mr. CORN—or as the register has it, JOHN BARLEY CORN. He went to Chicago and became known to a distiller. Being young, full of spirit, as I have mentioned, and withal confiding, this bad man soon "wormed" his inmost soul out of the boy and converted him into high-wines—something very bad indeed, I am told.

It was long before I heard from him again. When the news came that he had been "rectified," which I understood as meaning corrected, or set right, I took heart. But I was not long in finding out that this "rectification" was only another step in his distressing career. It was merely gilding refined gold—making him more seductive, that he might the more easily involve others in his ruin! A siren always sings sweetest when bent on thorough destruction, so our poor JOHN was none the less dangerous to himself and society because of being placed in a cut-glass bottle and prowling about under the *alias* of "Maryland Club Whisky." He was sold into slavery: a bright young man, the sole dependance of a loving mother and charming sister, paid a sum and took JOHN into his family.

Each day JOHN and this young man became more intimate, until at last they became inseparable. JOHN was none the better for this companionship, and the young man was decidedly the worse for it. And they did not agree very well together at first, either. After having "made a night of it" as the young man explained, he found himself possessed of a violent headache and other ills too indelicate to mention. But a resort to JOHN BARLEY CORN "toned him up," he said, until finally this "toning up" process became habitual and the baleful friendship was cemented beyond dissolution.

Then the misery began. Night after night these two made the earth hideous with their orgies. They called it having fun. I said it was slow and painful self-destruction; it was more, because their ruin involved the down-fall of the innocent, protesting, heart-broken mother and sister.

They became the fast friends of vice, and her handmaiden, drunkenness. They postured as ornamental monstrosities, pendant from lamp-posts. The gutter was their not unfrequent abiding-place, and when by chance they went reeling home at three in the morning, tipsy, jocularity suggested that it was early, as three was only a quarter of twelve!

It was not long before this young man, the only support of his mother and sister, lost the power of being useful to his employers, and with it his income. But the "fun" went on all the same, only now the sister was made to exchange places with the dissolute brother, becoming the bread-winner for the family; and it was little more than actual bread that was gained. A woman's work is rarely rewarded in proportion to her endeavor. The young man and JOHN had their good time nevertheless, which accounted for the gradual transfer of everything negotiable to the pawn-shop, until the destitution, moral and physical, was indeed extreme. The fast whitening hair of the mother, and the broken health of the daughter, should have given pause to their besotted career; but no, the fiend had them firmly, and merely grinned when the sheriff dispossessed the family of the trifle that remained.

I know I will be excused from continuing this painful history. It is not the pleasantest task in the world to record the destruction wrought by one's kin, and I somehow feel a part of the odium of having ruined a young man, driven a desolate mother to the poor-house, and consigned a sister to worse than death. If it were not that JOHN'S brother, of whom I shall next speak, tried to atone for such destruction by a life of usefulness I should be disheartened indeed. Even at the sacrifice of family pride I assert that I see no reason for the existence of JOHN B. CORN; he was as useless as a grave-stone after the resurrection, and infinitely more harmful.—To be continued.

The Puzzler.

CURTAILMENTS.

1. CURTAIL a river of Scotland, and leave an insect's egg.
2. A tree, and leave a pronoun.

Sabbath Reading.

NOT MINE, BUT THINE.

THY way, not mine, O Lord,
However dark it be;
E'er lead me by thine own right hand,
Choose out the path for me.

Smooth let it be or rough,
It will be still the best;
Winding or straight, it matters not,
It leads me to thy rest.

I dare not choose my lot,
I would not if I might;
But choose thou for me, O my God,
So I shall walk aright.

The kingdom that I seek
Is thine; so let the way
That leads to it, O Lord, be thine,
Else I must surely stray.

Take thou my cup, and it
With joy or sorrow fill:
As ever best to thee may seem,
Choose thou my good and ill.

Choose thou for me my friends,
My sickness or my health:
Choose thou my joys and cares for me,
My poverty or wealth.

Not mine, not mine the choice,
In things or great or small;
Be thou my guide, my guard, my strength
My wisdom and my all.

[*Anon.*

COMMUNION WITH GOD.

PSALM XXVII 4.

J. H. NEWMAN.

WHAT the Psalmist desired, we Christians enjoy to the full,—the liberty of holding communion with God in His Temple all through our life. Under the Law, the presence of God was but in one place; and therefore could be approached and enjoyed only at set times. So, for the greater part of their lives, the chosen people were in one sense "cast out of the sight of His eyes;" and the periodical return to it which they were allowed, was a privilege highly coveted and earnestly expected. Much more precious was the privilege of continually dwelling in his sight, which is spoken of in the text. He desired to have continually that communion with God in prayer, praise, and meditation, to which His presence admits the soul; and this, I say, is the portion of Christians. Faith opens upon us Christians the Temple of God wherever we are; for that Temple is a spiritual one, and so is everywhere present. "We have access," says the Apostle, "by faith into this grace wherein we stand, and rejoice in hope of the glory of God." Prayer, praise, thanksgiving, contemplation, are the peculiar privilege and duty of a Christian and that for their own sakes, from the exceeding comfort and satisfaction they afford him, and without reference to the answers which are promised to it, from a general sense of the blessedness of being under the shadow of God's throne.

What, then, is prayer? It is (if it may be said reverently) *conversing* with God. We converse with our fellow-men, and then we use familiar language, because they *are* our fellows. We converse with God, and then we use the lowliest, awfullest, calmest, concisest language we can, because He *is* God. Prayer, then, is *divine* converse, differing from human as God differs from man. Thus St. Paul says, "Our conversation is in heaven,"—not indeed thereby meaning converse of words only, but intercourse and manner of living generally; yet still in an especial way converse of words or prayer, because language is the special means of all intercourse. Our intercouse with our fellow-men goes on, not by sight, but by sound, not by eyes, but by ears. Hearing is the social sense, and language is the social bond. Prayers and praises are the mode by his intercourse with the next world, as the converse of business or recreation is the mode of which this world is carried on in all its separate courses. He who does not pray, does not claim his citizenship with heaven, but lives, though an heir of the kindom, as if he were a child of earth.

No, it is not surprising if that duty or privilege, which is the characteristic token of our heavenly inheritance, should also have an especial influence upon our fitness for claiming it, He who does not use a gift, loses it; the man who does not use his voice or limbs, loses power of them, and becomes disqualified for the state of life to which he is called. In like manner, he who neglects to pray, not only suspends the enjoyment but is in a way to lose the possession, of his divine citizenship. We are members of another world; we have been severed from the companionship of devils, and brought into that invisible kindom of Christ which faith alone discerns,—that mysterious Presence of God which encompasses us, which is in us, and around us, which is in our heart, which enfolds us as though with a robe of light, hiding our scarred and discolored souls from the sight of Divine Purity, and making them shining as the Angels; Faith, I say, alone apprehends all this; but yet there is something which is not left to faith,—our own tastes, likings, motives, and habits. Of these we are conscious in our degree, and we can make ourselves more and more conscious; and as consciousness tells us what they are, reason tells us whether they are such as become, as correspond with, that heavenly world into which we have been translated.

I say then, it is plain to common sense that the man who has not accustomed himself to the language of heaven will be no fit inhabitant of it when, in the Last Day, it is perceptibly revealed. The case is like that of a language, or style of speaking of this world; we know well a foreigner from a native. Again, we know those who have been used to educated society from others. By their voice, accent and language, and not only so, by their gestures and gait by their usages, by their mode of conducting themselves and their principles of conduct we know well what a vast difference there is between those who have lived in good society and those who have not. What indeed is called "*good* society" is often very worthless society. I am not speaking of it to praise it; I only mean, that, as the manners which men call refined are gained only by intercourse with polished circles, and as the influence of the words there used (that is, of the ideas which those words, striking again and again on the ear, convey to the mind), extends in a most subtle way over all that men do, over the turn of their sentences, and the tone of their questions and replies, and their general bearing, and the spontaneous flow of their thoughts, and their mode of viewing things and the general maxims or heads to which they refer them, and the motives which determine them, and their likings and dislikings, hopes and fears, and their relative estimate of persons, and the intensity of their perceptions towards particular objects; so a habit of prayer, the practice of turning to God and the unseen world, in every season, in every place, in every emergency (let alone its supernatural effect of prevailing with God,)—prayer, I say, has what may be called a *natural* effect, in spiritualizing and elevating the soul. A man is no longer what he was before; gradually, imperceptibly to himself, he has imbibed a new set of ideas, and become imbued with fresh principles. He is as one coming from kings' courts, with a grace, a delicacy, a dignity, a propriety, a justness of thought and taste, a clearness and firmness of principle, all his own. Such is the power of God's secret grace acting through those ordinances which he has enjoined us; such the evident fitness of those ordinances to produce the results which they set before us. As speech is the organ of human society, and the means of human civilization, so is prayer the instrument of divine training.

PERSONAL ITEMS.

Lord Dufferin's term as Governor-General of Canada expires June 1. He has held the office since 1872, and both he and the Countess are exceedingly popular.

The Illinois papers are again hinting at Hon. E B. Wasburne for next President. We suppose h will be put on the course for Congress and the Senate as a first step.

The Baroness Burdett-Coutts is the richest and most philanthropic woman in England. The bank of that name is hers. Hundreds have proposed to her, but she somehow thought, not being handsome, 'twas her money they wanted. She has been troubled all her life with a hereditary skin disease. She dresses always in black. Her Christian name is Angela.

Ex-Gov. Morgan, of this State, began business life in New York at the age of twenty-six as a jobbing grocer, on a capital of $5,000. He retired from trade after nine years with a fortune which he has subsequently increased, till he is now estimated to be worth ten millions. He has a son, Edwin D. jr., who is an able physician, and a grandson who is just becoming a society man.

THE Telegraph reported the other day that Jefferson Davis was received with special honors by President Diaz of Mexico. The person so entertained proves not to be the chief of the late confederacy, but Brigadier-General Jefferson C. Davis of the United States army, commanding on the Rio Grande frontier. What at first seemed to a studied affront to the United States, turns out to be a graceful compliment.

IT is not so very bad after all to be an ex-empress. The once gay and beautiful Eugenie has an income of $250,000 upon which she manages to pay her grocery bill and to live in what is called "dignified retirement" at Chiselhurst, England, where she daily takes long walks about the pretty lanes and wide commons. Sundays and fast days, and on the 9th of each month, she visits the Catholic Church where lie her husband's remains. She gives up her mornings to her correspondence and the newspapers, breakfasts at noon, and, as she has a royal memory and much vivacity, makes the meal a charming occasion; teas at five o'clock, usually receiving neighbors or visitors at that time, and dines at eight.

SPARKS AND SPLINTERS.

A NEGRO minister, who had married rather sooner after the death of his wife than some of the sisters thought proper and becoming, excused himself as follows: My dear brederen and sisters, my grief was greater than I could bear. I turned ebery way for peace and comfort, but none came. I sarched de Scripture from Ginisee to Rebelation, and found plenty promises to de widder but nary one to the widderer. So I took it dat de Lord didn'nt waste any sympathy on a man when it was in his power to comfort hisself: and havin' a fuss-rate chance to marry in de Lord, I did so, and would do so again. Besides, Brederen, I considered dat poor Patsey was jess as dead as she would ever be."—*Atlanta Constitution.*

EVEN a hair can cast a shadow over the happiness of a young married couple when found in the butter by him, or on his coat by her.

THE P. I. man says that George Washington "stood up and told the truth like a little bell-punch."

THE manner in which some people suppose the students of the Michigan Agricultural College hoe corn.

The manner in which it is actually done.

The Common Enemy.

In order to make headway against the common enemy, Disease, it is necessary to oppose him with persistence. It very frequently happens that a remedy perfectly adequate to the necessities of the case, if *persisted in*, is condemned and thrown aside because a few doses of it do not cure a malady. How unreasonable and unjust would such a judgement be regarding Hostetter's Stomach Bitters, one of the most popular and highly sanctioned medicines of the day, a potent invigorant and an invariably successful remedy for constipation, dyspepsia, liver complaint, incipient rheumatism and gout, inactivity and weakness of the kidneys and bladder, and for the infirmities incident to the decline of life. No fact is better established than the above, yet in order to experience its truth those afflicted with obstinate forms of disease should give this benignant curative a patient trial. If they do, they may rely upon decisive curative results.

THE CORTLAND

Platform Wagon.
To the Farmer and Dairyman, to whom a light-draft, easy-riding Wagon, capable of carrying from ten to fifteen hundred pounds, is a necessity, this is the
CHEAPEST AND BEST
Platform Spring Wagon made.
Every Wagon fully warranted.
If there is no agent or dealer in your town, send for Circular and Price List to the
CORTLAND WAGON MF'G CO.,
Agents wanted. Cortland, N. Y.

The Rectangular Churn
Simple, efficient and *always reliable.* No inside fixtures. Fifty per cent. in labor saved over *any other churn.* 5 sizes made. The Highest award given over all competitors at the late Dairy Fair in Chicago. An energetic man wanted in every town, to act as agent. One churn sent at wholesale where we have no agent. CORNISH & CURTIS, Fort Atkinson, Wis.

CHEAPEST FERTILIZER.
BECAUSE THE BEST.
PREMIUM BONE
For all crops. Made only by the EXCELSIOR FERTILIZER WORKS, Salem O. Circulars free.

TEAS REDUCED
OUR TERMS ARE THE BEST.
Send for our New Reduced Price List.

Field Crops.

HOW TO USE CLOVER.

W. J. FOWLER.

FARMERS who grow clover largely are almost necessarily improving their land. It is true that some modes of disposing of the clover crop are more advantageous than others, but so long as clover is grown the soil must be benefited. The roots at least must remain, under the most exhaustive system of cropping and clover roots are no mean fertilizer. They take from the subsoil and probably also from the atmosphere most of the substances which the plant contains. It is hardly possible, except by the utilization of atmospheric nitrogen, to account for the beneficial effects of clover on the soil. I have often seen good crops grown on clover sod without manure and on land which before being clovered was reckoned rather poor. Of course, the effect is all the better if a crop of leaves and haulm is turned under with the roots.

The clover helps the soil in other ways. Its roots are the cheapest subsoiler and if the field is not very wet, will give the soil all the drainage needed for ordinary farm crops. I am satisfied that farmers who grow clover largely, can keep their fields dry with one-half the underdraining they would otherwise need. Walking this spring over the fields, I find clover sod dry and ready to plow, while in timothy or other grass adjoining, the water oozes out from the surface under the pressure of the foot. Even in wheat fields I find that where clover has been plowed under, or even on a clover sod, the soil is much dryer than on wheat after stubble. The decaying clover roots form channels through which the water passes away.

Plowing-under clover when in bloom is rightly regarded as a wasteful method of using it—far better, however, than not using it at all. The objections to naked summer fallows are, that they require two seasons to make a crop, and that while the sod is decaying under the blaze of a summer sun or the unprotected surface of the field, much of the valuable part of the clover is lost. If the soil is rich, as it should be, it will produce as much after barley or oats as after a naked fallow. I do not suppose that fallows average five bushels per acre more of wheat than land sown after stubble. This year the difference will be even less, and some of the best wheat I have seen was after a heavy crop of barley. Five bushels of wheat are too little to pay the loss of a grain crop and the extra expense in cultivating the fallow. There is a more important loss, as summer fallows are usually plowed the year after the clover is sown, the roots have not yet made their full growth, and do not until the second crop of clover in September when the seed is harvested. This is not too late to plow and sow to wheat. Good crops are thus grown; but the difficulty is in getting a "catch" of clover seed. My way is to harvest two crops of clover the second year, the last of which is for seed. Feed this out on the farm, sow the seed and make a big manure pile. The year after, manure this clover sod heavily, plant with corn or potatoes and then follow with barley or oats and wheat again. In this way there is no trouble about a good catch of clover every year, and besides the manure made from two crops of clover, the seed sold and used will pay the interest on the land.

Monroe Co., N. Y.

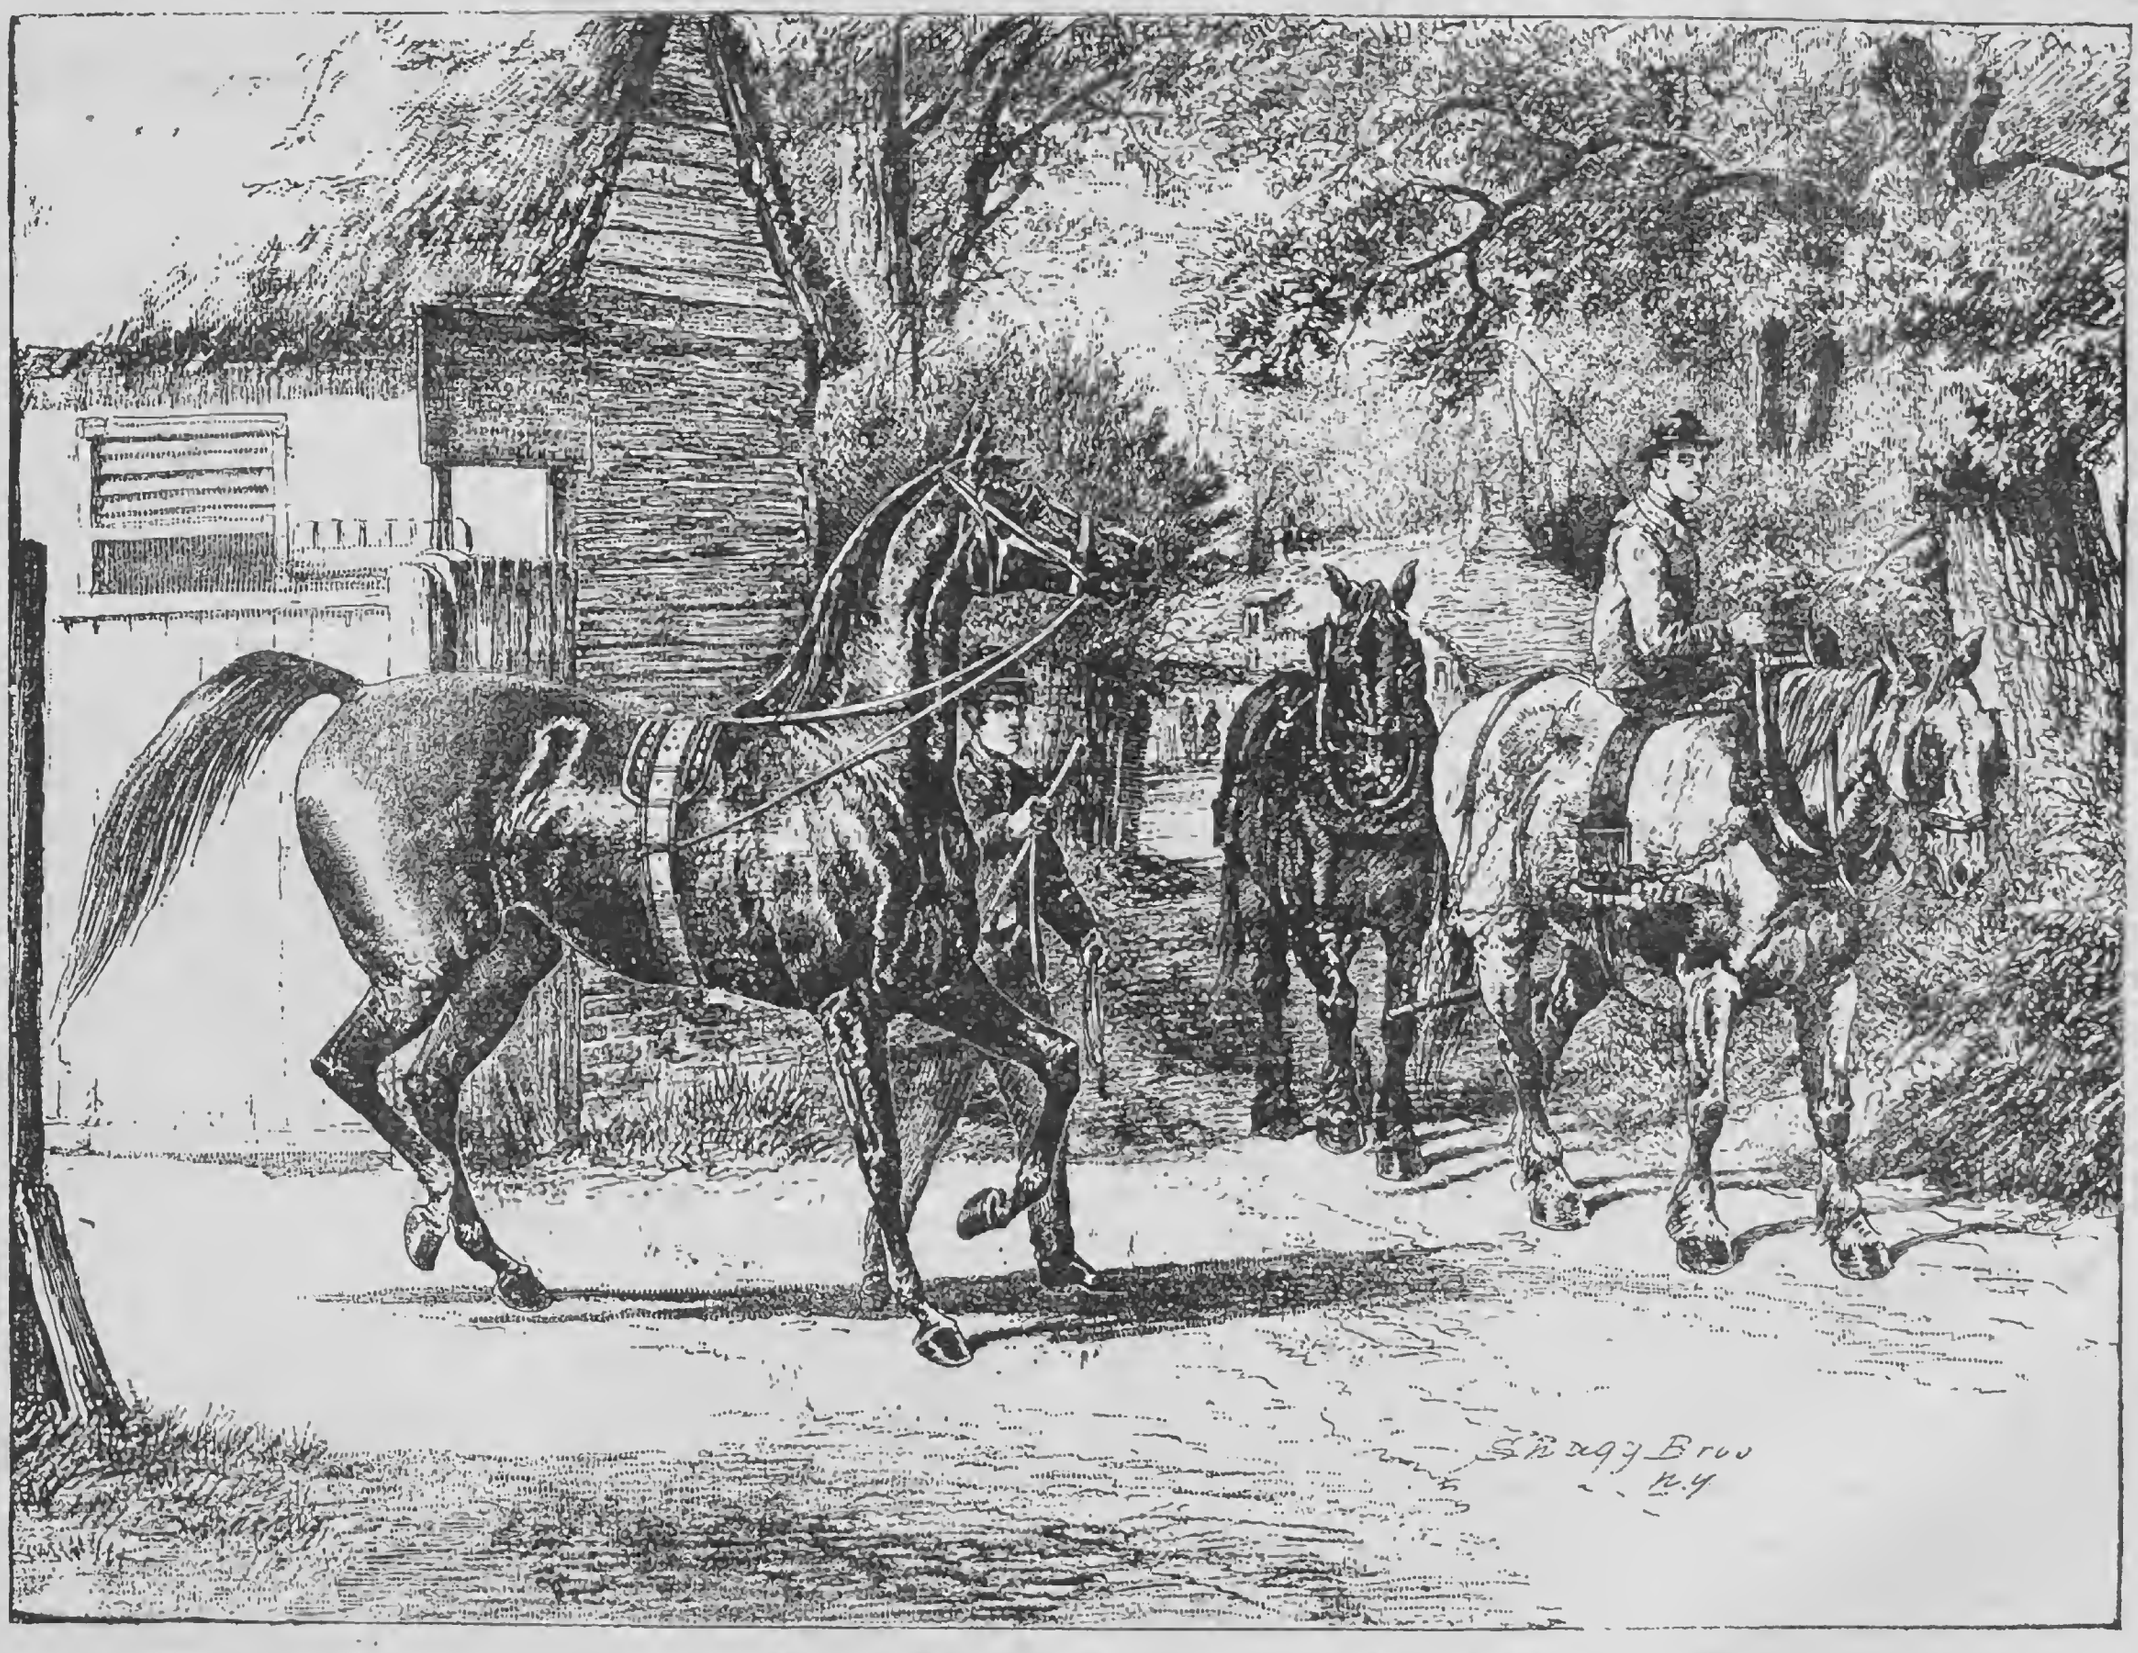
POTATO CULTURE.

PROFESSOR I. P. ROBERTS.

[THIS article is dedicated to the boys who, in addition to the usual amount of hoeing, will have to fight the potato beetles with pot and pan for the next two months. I have done much work in life, that was far from pleasant, but the most unpleasant, discouraging, back-breaking, side-aching work was hoeing and digging potatoes in a stiff, blue-grass potato field when a boy.]

AFTER numerous experiments and careful observation and study as to the best methods practiced, both East and West, in the cultivation and harvesting of the potato, I have concluded to give a brief description of the one which I have finally adopted and which I think I can safely recommend to others.

Select ground that has been tilled the previous year, plow and harrow as usual. In a week or ten days after, when many weeds have germinated and some have appeared above ground, secure a double mold-board plow, such as the Scotch and English use in ridge root culture; furrow with this four or five inches deep—the latter depth if manure is to be used in the drills—and three feet apart. The mold-board, though long, curves very rapidly at the upper rear end, grinding the small clods, compacting the soil slightly, and thus leaving a furrow clean and free from clods and stones in the bottom. In this furrow drop the seed—fair, smooth, medium-sized potatoes, cut into from two to four pieces each—from one foot to one foot and a-half apart. If farm manure is used, it should always be above the seed, not below it (Fig. 1—a). If no manure s used it will appear as in Fig. 1—b. With the same plow split the ridges,



THE ROMANCE AND REALITY OF FARM LIFE.

one horse walking in the furrow (a), the other in (b), and we have the appearance as shown in Fig. 2. They are now to remain from one to two weeks, by which time the soil will have be-

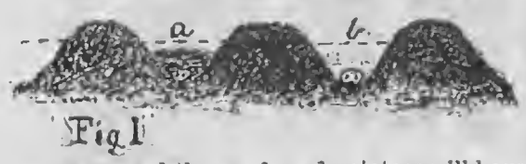


Fig 1

come warm and the weeds and potatoes will have started, the latter with sprouts from one to three inches long (as in Fig. 3). At this stage of growth, chain a 3x4-inch scantling, or rail, under the front of a heavy harrow and drive lengthwise till the surface of the ground is nearly level, as shown in Fig. 3. This destroys all weeds and rolls all sods, clods and stones be-

Fig 2

tween the rows and leaves the rich, mellow earth just where it is wanted. A second harrowing, without the scantling, after the potatoes are well through, will usually be very beneficial. The next implement is a two-horse wheel cultivator, such as is used in the West. This implement, in skillful hands, will work the ground so close to the row that weeds have but a very small

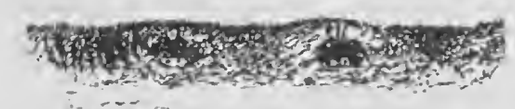

Fig 3

chance of escaping. Once cultivating each week till the potatoes are in blossom, and finally a run through the field to pull up, here and there, a weed that has escaped, and the work is completed.

To harvest them: procure a load or two of second-hand cement barrels, which can be purchased here in abundance at from five to eight cents apiece and, if cared for, will last five or six years; distribute them over the field; start the potato digger, and drive fast, as the potatoes are thrown out much better than when the team walks slowly. I also have eight pickers, provided with half-bushel baskets, picking the merchantable potatoes first and the smaller ones afterward. To complete the work, harrow thoroughly to expose any that have been partially covered or skipped.

We now have the large and small in separate barrels, not quite full two and a half bushels, so that they will not spill in loading. Two strong men will load ten barrels, or twenty-five bushels, in five minutes. As a rule, they should be sold before digging, so that they may go direct from the field to the purchaser, saving all extra handling and all extra time lost in hunting a purchaser after they have arrived in the market. On good land I have several times raised and marketed potatoes for ten cents and less—once for eight cents—per bushel as the cost of labor and seed. From a few experiments, I have come to the conclusion that thirty cents per bushel direct from the field are equal to forty in May, to say nothing of the risk of freezing and rotting. Mr. J. J. Thomas, at the Ithaca Farmers' Institute last winter, stated that from numerous experiments he had found that five inches is the best depth at which to plant, and that anything beyond very slight hilling was injurious. This so exactly coincides with my own experiments that I believe it to be the best practice for this locality.

Cornell University.

Farm Economy.

HIRING HELP AND OVERSEEING WORK.

PROFESSOR W. J. BEAL.

Most men have no tact in planning work or in directing others in their employ. Every day's work they hire often costs them more than the return in increased yield of produce. Such people are very likely to be always complaining about the poor quality of their hired help, when the fault is often largely due to their own lack of good management. Such men find it most profitable to tend a small place and perform all or nearly all of their own work.

In hiring a person, as in every other bargain, no matter how well you are acquainted or how intimate you may be, it is always the best way to have a definite understanding as to the duties to be performed and the wages to be paid, the time, manner of payment etc. Draw up a plain statement in writing of the agreement and let both parties sign it. Specify the rate of wages by the day, week or month, and if one week is worth more than another, specify the price for each. In making bargains other points will suggest themselves to thinking farmers. If all would pursue some such plan, many a quarrel and misunderstanding would be prevented.

Where the number of hands is large and the work of certain kinds, it is a good plan to arrange with hired help to furnish their own tools or a part of them, as spades, hoes, etc. In planning work for others, much of the success or profit depends on having everything go off well and without frequent changes or delays. Every man should work to advantage and should as far as practicable, be kept continually at certain kinds of work which he can perform rapidly and in the best manner.

Mr. PARRY of New Jersey, gives the following mode of managing a lot of pickers of berries. "As the berries are brought in for packing, they are carefully examined and at least one of each ten or a dozen emptied in presence of the pickers; if they turn out all right, they are paid in white tickets, but if small, green, or faulty berries are mixed among the prime ones, or they are not put up as directed, a blue ticket of less value is given, a practice which has a salutary effect, as it is mortifying for them to receive a blue ticket, which is the signal of bad work, in the presence of others. This system works beautifully; it is a constant stimulant for right-doing."

For picking strawberries one and a-half to two cents per quart have often been allowed; for raspberries and blackberries, a little less. At these rates, a smart lad or woman will sometimes earn a dollar and forty or fifty cents a day or even two dollars for picking one hundred quarts.

In drawing manure, turning and spreading and in many other operations, frequent occasion must be had to time hands at a particular part of the work, and to experiment in doing it in different ways to learn and then practice the best way.

To stimulate them and get the most work out of them, some find it necessary to "hoe a row" and lead all the rest through thick and thin, all day long for the whole season. Others succeed equally well with trained foremen and give most of their own time to plans for the rest, and now and then pick up the odds and ends and see that all things go off smoothly. By this kind of preparation and foresight the employer will prevent many delays and accidents and be the better prepared to meet them when they do occur. "Do not begin any operation that cannot be carried through in the best manner; keep all operations in a compact shape and everything up to time."

In every business it is very important that the proprietor understands all the details himself. He must know by personal experience and sound judgment just what is a good day's work. Men, if left to themselves, will very soon try the judgment of their employer and most likely impose upon him in all possible ways, unless he insist on a faithful performance of every duty. The director must have a quick eye to discover all slighted work and be able to show unskilled men how to perform correctly. He must insist on having the work done just as he wants it done. He should be concise in his directions, use but few words and not talk loud or too much. He will usually insist that no conversation be carried on while the hands are at work. He must have the tact of correcting, reproving, stimulating men to great exertions without incurring their displeasure.

An employer will be much more successful with his hands if he takes an interest in their personal wants and tries to treat them on all occasions with courtesy and respect. He must never lose his temper.

Agricultural College, Lansing, Mich.

SPREADING MANURE.

A GREAT amount of labor may be saved by spreading manure directly from the wagon or cart in which it is drawn into the field. This is not the only advantage, as in this way the manure may be scattered much more evenly over the ground. When it is thrown off into heaps, there always will be spots left without it and other places, where the heaps were, which will be too rich: the grain is apt to lodge on these places or to fall down, from too rank a growth, and on the spots between the heaps, it will be poor. When thrown from the load it can be carefully distributed and the places where it is most needed receive an extra sprinkle, so that the crop will grow evenly and, if seeded with grass seed, there will be a good catch all over the field, which cannot be the case when the manure is placed in heaps and spread from them. It is a good plan to get the manure on, and into the soil as rapidly as possible, and this can be done better by spreading directly from the load. Every rain washes it in then just where it is wanted, and when the plow or harrow comes along, it is covered up so that all of the plants can reach it. As manure is most valuable while decaying, it is best to bring it in contact with plants as soon as possible, hence it is best to clear the barn-yard in the spring and let the growing crops have the benefit of the decomposing process, rather than the barnyard where it is not needed, and the atmosphere which will carry its good effects to the neighbors' crops as well as to our own.

If any manure is left in the yard after spring, it should be heaped up and a sprinkle of plaster—gypsum—applied about once in a week to prevent the escape of the manurial gases. The plaster fixes or holds the ammonia so that it is not lost. The pile should be forked over occasionally, and wetted to prevent burning. When a manure heap is left to decompose and ferment without stirring or forking over, it is certain to burn and be materially damaged. It is well to mix plaster all through the heap. A ton of plaster used up in this manner will make a compost, or a manure heap the enhanced value of which will be worth far more than the cost of the plaster. Dirt, weeds, and almost any sort of refuse, may be added to the manure heap, and the heat of it will kill the seeds of weeds or cause them to grow so that by the time it may be wanted for use on the wheat ground, they will be harmless. Manure left scattered over the barn-yard during the summer is almost worthless, as it is leached of much of its value, and deprived of a good deal more by the constant evaporation going on all through the hot weather. Dry earth will answer very well in place of plaster to arrest evaporation, and by autumn it will have become, by being mixed with the manure, as valuable as it. Muck will not take the place of plaster or of dry earth for this purpose, but it is good—most excellent to absorb the juices contained in the manure or flowing from the stables. The muck, if made perfectly dry, would absorb ammonia, but not equal to plaster or dry earth. Sand is not good; it should be loam. Sandy loam would do very well, but clear loam is the best. The soil of road-sides may furnish a supply.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE have tried the "Cresylic sheep dip" (at our request.—ED.), manufactured by KIDDER, LAIRD & Co., New York, and found it to be effectual in killing the ticks on the sheep. As the sheep were in full fleece we made it strong, at the rate of one pound to five gallons of water. This solution gives no pain to the animal and is not at all dangerous to handle. After shearing, the ticks which are left on the bodies of the sheep, leave them and go on the lambs. If the lambs are dipped twice they will be rid of the ticks, as the second dipping will kill those not hatched at the first. There should be a week's difference between the dippings. We never had so many ticks on our sheep as this year, and it is not because they are so poor, but because the season has been so very favorable for the growth of the ticks. A fat sheep may be full of ticks, but they do not show so much as a sheep in good condition generally has a thicker fleece and more surface of body for them to be distributed over.

We had a small sheep which had twins, and as the lambs would make a heavy draught upon her, we commenced to feed her liberally with oats to make plenty of milk. Result, fever, and now her fleece is all dropping off and in a few days she will be completely denuded. Grain-feeding to sheep must be gradual, beginning with a mere handful, or even less.

The buckwheat straw we spread on the rye last fall did not smother out the grain, but served as a protection. Where it was packed down in bunches, it has been shaken up and spread around. This is a good way to get rid of buckwheat straw, to draw it directly into the field and scatter it on the rye; stirring it up in the spring is but litttle work.

Esquire Davidson had sixty-three chickens hatch last year and raised sixty-two. He attributes his great success to the introduction of new blood; or, in other words, using roosters not related to the other fowls. The chickens were strong and vigorous, and gave him no trouble, while the year before he had nearly a hundred hatch and lost almost the whole of them, as they were puny and weak.

Our little pigs are doing nicely. One of the pens is fixed so they can go in and eat all the oats they want. They seem to enjoy this side-feeding, and at all times of the day some of them may be found there. Before they were three weeks old they would eat some, and this extra feed keeps them from lugging the sows so much. Little pigs are very fond of oats, and they will not eat enough to hurt themselves.

We thought this morning that a worm was destroying the rhubarb, but as we could not find any on the leaves which were full of holes and ragged, we finally concluded it was the turkeys which were treating themselves. Our rhubarb is very fine this spring. It was nearly run out in the old bed, and last year it was taken up and changed and the roots divided. This seemed to give it new life. In a few years it will be best to move it again. The asparagus is coming up through the manure, and we have already had one mess. There are no weeds visible, and the prospect for lots of asparagus and few weeds is exceedingly flattering.

Peaches two years in succession are something new in this cold latitude, but such is the case. There used to be peaches every year, before we were born, but since then we do not remember peaches after peaches. Ours are nearly all self-planted and of course not very choice kinds, but they are good for canning, and some of them eat very well "out of hand." It is so little trouble to raise peaches that we now wonder why there are not more of them grown. The boys ought to plant pits this year and in three or four years they can have peaches.

A hen has been set to-day on Aylesbury ducks' eggs, and we must not forget to wet them two or three times with warm water before they hatch. This is necessary with the eggs of all aquatic fowls. The hen does not get her breast wet so as to furnish the necessary moisture, which is the case with water fowls, and there is danger that the skin which lines the inside of the egg will become so dry and tough that the little duckling cannot break through it. A few years ago two whole clutches of ducks died in the shell after they were pipped, because the eggs had not been wetted. We forgot it, being away from home, and some of the neighbors said it was thunder which killed them. This used to be an old notion.

Mr. Prince evidently appreciates the difference between a scrub pig and a well-bred one. Mr. Smith says he is right and so does Mr. Butler, who says he fatted a Victoria pig last year on 8½ bushels of corn and it dressed, when eight months and nine days old, 171 pounds. This pig had the milk of a three-year-old Jersey heifer besides the corn. He says he fed a scrub pig, a few years ago, plenty of milk and 28½ bushels of corn, and it weighed when dressed, at nine months of age, 125 pounds. The scrub had more milk than the other and ate more than three times as much corn.

Saratoga Co., N. Y.

Floricultural.

HANDSOME FLOWERING SHRUBS.

WILLIAM FALCONER.

No garden of any pretensions should lack a few shrubs, and as there is such a great variety to choose from, it is natural that we should want the prettiest and the hardiest, and a selection such as will afford us flowers throughout the whole summer. Of course, we cannot define the exact flowering period of any shrub, as that depends on the earliness or lateness of the season, the situation and other conditions of growth, and the part of the country wherein it is growing. In the following I have given the times of blooming from observations noted here during the past two years.

Among our earliest shrubs to blossom are Daphne Mezereum, a little European whose branches in March and April are clothed with purple blossoms to be succeeded, by midsummer, with brilliant berries. Then come the Cornelian Cherry—Cornus Mas—western Buffalo Berry, Leather-wood, and Spice-bush, in the order named; and all have small yellowish flowers that appear before the leaves. Though their blossoms are not very ornamental, they are interesting on account of their earliness. Contemporaneous with the above are the little shrubby Yellow Root of the Alleghanies, with its compound panicles of blackish-purple flowers; and the showy Forsythias, of which F. suspensa is the earliest, palest-flowered, and most useful for covering trellises or porches, or other vine-applicable purposes, and F. viridissima for hedges or single bushes. About a week later, Magnolia purpurea displays its many large, whitish-purple flowers before a leaf-bud bursts. Rhododendron Dahuricum, with rose-purple blossoms expands in early April to May, and is accompanied by Andromeda floribunda, an Alleghany evergreen shrub that sets a profusion of flower-buds in fall and opens them in spring; and Cassandra calyculata, the Leather-leaf of our Northern States. Spiræa Thunbergii dons its snowy cloak as April makes its exit, and at the same time the gaudy Japanese Quince, Cydonia Japonica, displays its wealth of scarlet-red.

Towards the end of April the yellow-flowering Currant has revealed its little clusters, and—where hardy—the crimson flowered one, quite an ornamental species—is of equal season. About the close of April and in early May the naked branchlets of the American Red-bud are covered with little peach-colored blossoms, as are likewise those of the more showy European species. Then appear the Lilacs, white and purple, Persian and common, and which are as much at home in the city as in the country gardens; and surely it is a very poor garden indeed that cannot boast of a Lilac bush. Then comes the grand rush; our gardens are a-blaze; the air is perfumed, and Flora's opulence is prodigal: Amelanchiers are profuse in blossoms; Double-flowering Almonds have their twiggy branches thickly studded with "daisies;" Exochorda grandiflora, one of the handsomest of the Spiræa family, is clothed in white; early flowering species varieties, and hybrids of the deciduous Azaleas are in blossom. English Hawthorns, single and double, white and red, diffuse their welcome fragance; the Chinese Wistarias drape our walls, arbors, or old tree stumps with drooping clusters of blue or white; and Dicrvillas unburden their

empurpled limbs, preparatory to being shortened back a little so that the next year's supply may exceed that of the present. Towards the end of May Deutzia gracilis becomes clothed with its snowy panicles, and on account of its neatness, dwarfness, profusion, and hardiness, surely it deserves a place in the smallest garden. About a fortnight later D. crenata, with single and double flowers, puts in an appearance and it too is one of our choicest shrubs.

Early in June the Fringe Trees, having remembered to leaf out, are a mist of sprayey whiteness, and about the same time the Yellow-wood trees, large and small, are drooping with heavy panicles of white pea-shaped flowers, humming with bees, and diffusing fragrance all around. From the end of May up into June the Tatarian Honeysuckle bushes are a-glow with white, pink, or rose-purple flowers, which are succeeded in a few weeks by bright orange berries. From the end of May till nigh the end of June the Large-leaved Mountain Laurel is doing its uttermost to reclaim the dreariness of the New Jersey woods or hold its own in our gardens, and that it does effectually, for surely no shrubs bloom more lavishly. And in May to July the crimson-purple corymbs of the Sheep Laurel are abundant in our woods and, if we choose, in our gardens. Potentilla fruticosa from early June blooms all summer long.—[Conclusion next week.

CARPET BEDDING.

CARPET bedding consists in the decoration of our flower-beds with neat dwarf-habited plants that are more conspicuous for their compacted nature and brilliant or dense leafage than for their flowers. Circular, square, oblong, oval, and other plain-patterned beds are the easiest and most prettily carpeted. The design may represent any conceivable idea, and should be executed so that at a distance or in proximity, the pattern may be as definitely plain—recognizable at a glance. These beds require thick planting so as to produce immediate effect, and afterwards, the greatest vigilance in sheering or pinching to prevent the lines running into one another, and thus obliterating the design. They not only require a deal of plants to begin with, but a great amount of patience and oft-repeated application in their summer care. Intricate tracery on a flat carpet bed is somewhat formal, no matter how minutely executed, hence the introduction of one or several isolated "relief" plants, as green-leaved Dracænas, variegated or plain-leaved Yuccas, Century Plants, and the like.

In England this kind of gardening is more practised than it is here, because there more kinds of plants are applicable for the purpose than is the case with us. They have an excellent blue in Lobelia and orange in Nertera depressa, both of which succumb to our summers. They have a fair yellow in the golden Stellaria which is unreliable here, and our Alternantheras—the back-bone of our coloring material—grow much the rankest in this country. Among the plants most commonly used for this purpose are: for white or silvery gray, Antennarias, Veronica incana, variegated Sweet Alyssum, variegated Stevia, variegated Solanum, Centaurea candidissima, Leucophyton Brownii, Guaphalium lanatum, Stachys Germanica, Sedum variegatum, and Artemesia frigida.

Golden Feather Feverfew is our best yellow and is supplemented by the variegated Abutilon vexillarium, pegged and pinched, and some of the best and most compact yellow variegated and golden-bronzed Pelargoniums. For blue Kleinia repens takes the lead, and then follow many kinds of Echeverias, Sedum glaucum, dasyphyllum and Hispanicum. But none of these is true blue; in fact, we are almost minus that color; for though dwarf Ageratums be used they are not persistently reliable enough. Good carpets of green are secured in various kinds of Sedums, as acre, sexangulare, and the like. Sempervivums or House-leeks are lavishly used in carpeting, and are quite effective, but medium sized plants are preferable to full-grown specimens, on account of the maturely developed ones blossoming, hence dying, thus leaving a gap. Therefore a few reserve plants should be kept in case of emergency. They are perfectly hardy and prettier and more satisfactory when exposed to the full winter's severity than when mulched or housed. Among the best are arachnoideum, tomentosum, piloselium, all cob-web kinds; montanum, calcareum (Californicum), Funckii, arenaria, Comollii, Powellii, stoloniferum, tectorum and some of its many varieties, etc. For fiery coloring, Alternantheras are alone, and that lately produced variety of amœna is the most brilliant of all.

The annexed illustration represents a carpet flower-bed at Clapham Park, London. It is a saucer-shaped bed 12 feet across with an elevated rim a foot wide, a 3 foot high mounded centre, adown which at regular intervals depend eight chained jeweled beds which consist of little succulent covered mounds, each surmounted by a plant of Chamæpuce diacantha. Beginning with the center the filling is composed of, 1st, a all specimen of Dracæna indivisa, 2nd, around the Dracæna, a 2½ foot wide mass of the variegated Mesembryanthemum cordifolium; 3rd, a 2 inch wide band of Sedum Lydium (green); 4th, a band of Echeveria secunda glauca; 5th, Alternanthera amœna, 6th, a belt of Sedum glaucum studded with little circles of Echeveria containing in their center a patch of Nertera depressa—a miniature plant covered with tiny orange fruits;—7th, Alternanthera amœna; 8th, Echeveria. From this 8th belt depend the chained jewels resting on a broad ground-work of green, formed by Sedum Lydium. The elevated rim is of rounded outline with inner and outer circles of Echeveria secunda glauca. Next to each of these circles is a belt of Alternanthera amœna, and in the middle a wider band of Sedum glaucum studded with Nertera depressa.

Arboricultural.

WHAT SHALL I PLANT?

SAMUEL PARSONS.

No. 3.

To answer such a question with any degree of completeness would require volumes, and it would be well if sufficient interest existed to make such volumes attractive to the world at large. A great part, indeed, of the charm of natural landscapes, in glades or forest, lies in the almost numberless varieties of plants that constitute them. Space, however, only permits me to mention a few prominent examples specially fitted to produce certain important effects.

The skeleton or framework of the place should be built up of Spruce and Pines. They grow large and make massive shelters against bleak northwesters. They should be planted on a somewhat irregular system by which the front tree fills up the gap presented by the two rear ones, while the whole shows a waving outline devoid of stiffness. The Norway Spruce performs this work most rapidly and completely, and may be well supported by the contrasting and beautiful hues of the larger Pines.

For symmetry and endurance, few surpass the well-named Black Austrian, although the erect elegance of the Swiss Stone Pine, Pinus Cembra, is both hardy and picturesque in the landscape. The Stone Pine, however, does not make a good wind-break, while the Scotch does, notwithstanding its irregular shape and meager look as it grows old. Moreover the Scotch Pine resists well the bleak winds and sea air. Other Pines and Spruces there are, but they are ill-adapted for the purpose of shelter. Like the White Pine, they are too open, or too slow of growth, and consequently have attained less popularity.

The framework established, next come the filling in of the shades and tints, the arranging of striking figures in the fore-ground, and the planning of all the vistas and graceful effects that go to make up the perfect landscape picture. If the place be large, I would use prominent specimens here and there on the outskirts, facing, like sentinels, the flanking shelter groups. Grandest of all evergreens for this purpose is the Picea Nordmanniana, shining and glossy-green of foliage, symmetrical, stately and tower-like in form. It is the king of evergreens, and attains its full majority only when the Norway Spruces are lapsing into thin and naked old age. Picea nobilis, steely blue, like tinted velvet, offers lovely forms for occupying prominent positions. Light-colored, long-leaved P. firma, most vigorous and hardy of conifers; P. cilicica, soft-leaved and of exquisite spring growth, P. Pichta from Siberia, richly hued and finely formed, all have notable qualities, well adapting them for lawn decorations. They all have the long-lived beauty which renders them well fitted to stand in groups bearing such a relation to masses of Spruces and Pines that, in the years to come, they may fill their places, when deformity requires their removal. All Piceas must be transplanted and pruned frequently, or they become worthless for lawn planting. Two or three Spruces—Abies orientalis, dark-green, shining and very massive, and Abies excelsa inverta pendula, remarkable and picturesque with drooping foliage hugging the stem—and at least two Retinosporas—obtusa and pisifera—are also well fitted for single, large specimens.

A very important element of fine lawn decoration will be found in groups of dwarf or lower-growing evergreens. They may be employed immediately about the house, or on the curves of paths near by. Planted three feet apart, it will be 10 or 15 years before any of them interferes with another. Large specimens are fine, if planted singly, but massed in groups, their varied colors and forms exhibit the most striking effects. Of course, all cannot be named here, but there are at least a dozen choice ones which should form part of every group of considerable size. Broad-leaved Hemlock, dark, hardy and of waxen luster; atrovirens, also extremely hardy, dwarf, dark and shining, constitute two members of a species, the crowning glory of which is the Weeping Hemlock of graceful sprays and fountain-like habit, a veritable queen of evergreens. Then come the Conical Spruce, most popular of dwarf evergreens, symmetrical and compact; Gregory's Spruce, massive, broad and dwarf, and neat little nigra pumila, with form of perfect finish, not forgetting Abies diffusa, richest and finest of dwarf Spruces in a way hardly describable—all form a most valuable group of dwarf ornamental trees.

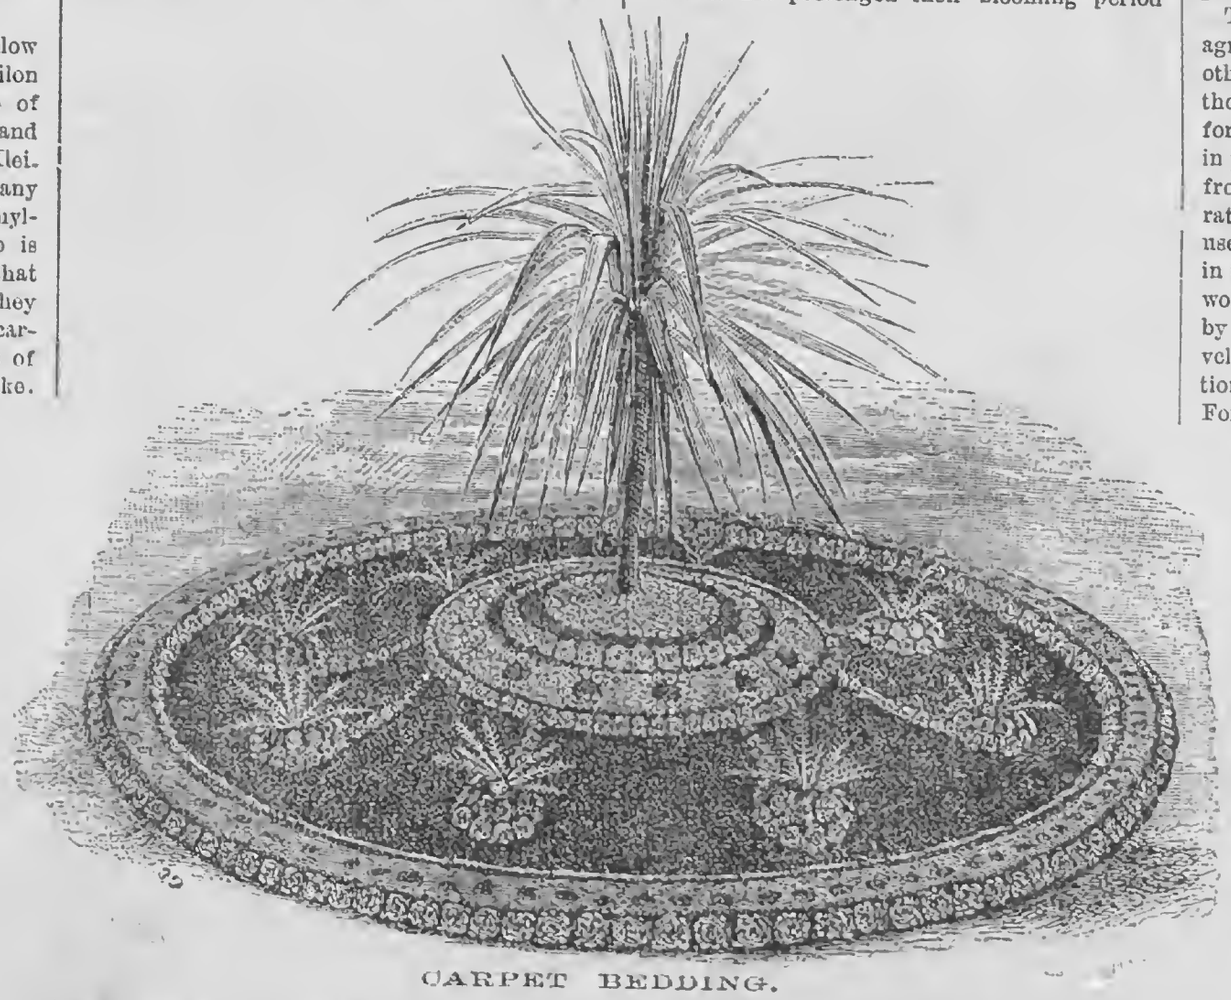
The Biotas, perhaps less popular because in some cases less hardy, furnish rich material in the golden elegantissima, the new Pyramidal and the hardy Nepalensis. Junipers are of taller growth except such as Swedish Dwarf, Juniperus tamariscifolia, prostrata, squamata, etc., which are very low and curious. Among Piceas we have the exquisite little Hudsonica, dark green and strangely dwarf, and compacta of hardy habit and elegant form. The soft, feathery needles of the Dwarf White Pine, and the darker, richer tints of the Dwarf Scotch and Mugho can be ill spared in any group of evergreens. Retinosporas have many dwarf and strangely diversified forms, such as filifera, leptoclado, lycopodioides, etc., but few surpass plumosa aurea for ready transplanting or lasting gold, which latter feature is so effective contrasted in masses with the Broad-leaved Hemlock macrophylla. Nor must I forget the Golden Yew, of unrivaled color in June, but later surpassed by the golden Retinospora in both beauty and hardiness. Did space permit, much might be said concerning these remarkable and comparatively unknown plants, each one of which is deserving of an article to itself.

SPRING'S PROGRESS.

RURAL GROUNDS: May 13.

THE late Tulips are nearly gone now at a time when in previous years they had scarcely begun to bloom. The season, owing to mild, cloudy weather has prolonged their blooming period and the flowers, it seem to us, have never been equaled in brilliancy.

Conifers have all of them started their spring growth and present that lovely contrast of light and dark-green which at this stage renders them more attractive than at any other time. Decidious trees of all kinds are in leaf except, it may be, the lazy Weeping Ash which, is only just beginning to open its big, black eyes.



CARPET BEDDING.

Miscellaneous

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

"HAVING EYES, THEY SEE NOT."

CHAS. W. GARFIELD, SEC'Y OF THE MICHIGAN POMOLOGICAL SOCIETY.

I HAVE just attended a teachers' Institute, where learned men and women, who are called the educators of the children in this country, were gathered, and occupied a day in discussing the merits of this and that method of teaching. I listened to beautiful essays on "The Word Method," "Easy way of Computing Interest," "Order in the School-room," "Natural Instruction in Local Geography" and "Grammar by Short Steps and No Halting."

I confess that there was much of interest to me in the papers and discussions that followed, but I was somewhat surprised not to hear something upon the best plan of developing observing-powers in the pupils. I go out among the children and am astonished every time that they, as a mass, know so little about the commonest things about them. Boys that know the multiplication table by heart, do not know that an elm tree bears flowers, or that a butterfly comes from a caterpillar. Girls that can conjugate the verb "To love" with the most startling rapidity, open their eyes in ignorant wonder at the announcement that, a clothes-moth turns into a winged insect, or that the beautiful piece of stone they have called "petrified honey-comb" is a piece of coral, made by a little animal in the sea. A man who has taught school for years and has spent other years in giving the people the benefit of his thought upon questions of agriculture and horticulture, asked me the other day "Why do the Maples look so red this spring?" exhibiting the fact that he did not know that there was such a species as the Red Maple, and that its blossoms appeared before the leaves and gave it its common name; and when told of the fact, he said "Blossoms before leaves! how can that be? How can a plant flower before it is in leaf?" And when twenty illustrations of this kind were given, he expressed astonishment at his own ignorance.

Every day, wherever I go there is this same exhibition of ignorance of the most common things about us, and I am led to believe that the fault lies largely in our schools; there is too much teaching of Arithmetic, Grammar, and Geography, and too little developing of the observing powers. It is worth a great deal more to a child to know the difference between a bug and a beetle than to know the length of the Mississippi River or the hight Lake Michigan is above the ocean. The common school is to give the foundation for further knowledge; it is to sharpen the appetite for more learning, and I am in favor of making every step count by giving valuable information while working to discipline the mind of the pupil.

The great fault we find with men engaged in agricultural pursuits, who are willing to give others the benefit of what they know, is that they theorize too much—take too many things for granted—give us too much closet literature in place of farm experience. I think this comes from the early teaching which deals with books rather than with natural objects. Where one is used to turning over books for facts and is not in the habit of looking for himself but into the world for them, it is a great deal easier to sit by the desk in front of a library and develop ideas than to search for original observations on the farm, in the woods, or in the shop. For this reason we get a good deal of reading that is good, only it is warmed over. We would do well to heed the facts contained in it, but knowing they are dished up from the shelves, it is not appreciated.

The following would be considered a very queer question to put to a class of teachers on examination for certificates: "Where do our flies come from and what use do they subserve?" And still it is a far more sensible one than are one-half of those which, if correctly answered, win the certificate. "But this is a question in entomology and we are not required by law to answer questions in that?" is objected. I may not know what the law is or what the word entomology signifies, but I *do* know that it is a question that every observing child will ask sooner or later, and if the teacher can answer it himself, he will know the kind of information that is required in developing that child's tendency to observe. I wish more common sense could be put into our heads about the necessity of every teacher having a large fund of knowledge of common things that can be seen and heard. The teachers too often are of those that "having eyes, see not," and the difficulty is propagated in our system of education.

I know a professor that teaches botany by driving his classes into the fields and woods be

fore he gives them any books. He thinks every pupil should have first a few lessons in language before they study Botany directly—the language of nature. He first teaches them to be interpretors of this, to them, almost unknown tongue. It is quite astonishing how little the pupils, most of them, see the first time out. The true teacher under such circumstances does not tell directly what to see, but how to look. Very rapid progress is usually made under this plan, and I have in my own experience found that not the least valuable feature of this plan is, that the rapid acquirement of new facts stimulates to great effort to get more.

For a short article this is very rambling, but I intend it to be pointed toward what I am now about to say:

Everybody engaged in agriculture and horticulture nowadays is putting more or less confidence in experiments. Agricultural colleges are asked to perform thousands of experiments and in turn these colleges are asking the people to experiment. Agricultural papers are recording these experiments and they are all working at the right thing. But, I ask, how are we to expect one in a thousand of these experiments to be worth anything when the men who perform them know so little about accurate observation. The primary training is not in the direction of observations and how are these people, with no preparation for seeing, to see anything? This is why we get such a long record of experiments each year, with so little of real value. The experimenters have not been educated to see. I feel daily this defect on my own early training. I put in too many hours over Brown's Grammar, that I ought to have employed in learning how to see. Grammar has its place, but it should be a great deal nearer the college, and a great deal farther from the alphabet, than it is ordinarily placed. The development of the powers of observation can be pushed at a very early date, and I have often found the men best adapted to close experimental work who were kept at home on the farm when quite young, and from necessity were compelled to give up the privileges of school; but they learned many lessons that have proved of greater value than the majority of those conned at the student's desk.

My appeal, then, is to those who have the control of the common schools, to see that the kind of instruction and the methods pursued are calculated to prepare the boys and girls to become thirsty for new facts and more knowledge—diggers after information at the original mine. This is what is needful to make them valuable men and women, to aid in the development of the agriculture and horticulture of our country, and, in case they go into other callings, this foundation training could not be improved. Whatever a man's occupation may be, there is great gain in having learned to see quickly and accurately.

AMERICAN TEA.

DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C., May 3, 1878.

EDITOR RURAL NEW-YORKER—*Dear Sir:* As you have exhibited some faith in the success of the efforts of this Department to produce a good, merchantable tea in the United States, I take pleasure in sending you a drawing of tea made from American-grown leaves by an expert in the business, Mr. Gill, of the firm of Martin Gillet & Co. of Baltimore, who has spent six years in China and Japan, in buying and curing teas for his house, and a copy of whose letter to me, transmitting the tea, I send you for publication, if you so desire. Very respectfully,

WM. G. LEDUC, Commissioner.

BALTIMORE, May 2, 1878.

HON. WM. G. LEDUC, Commissioner of Agriculture, Washington, D. C.—*Sir:* With this we take pleasure in handing you sample of tea we have made from the leaves we received from South Carolina on Thursday of this week. In the preparation of this tea we have discarded all manipulation that could not have been better done by very simple machinery. Our apparatus was a wire sieve, a gas jet and a tin pan. We have produced a tea that we unhesitatingly pronounce as equal to any brought from China or Japan to this country, and which in point of flavor (due in a measure to its freshness) is greatly superior. The flavor is between that of a Japan tea and a fine Chinese green, and one that we think would be exceedingly popular. The most remarkable circumstance connected with this sample is that many of the leaves of which it is made would have been considered as unfit to produce a good tea in either China or Japan. With a more careful selection of leaves we believe a tea much finer than this would be produced.

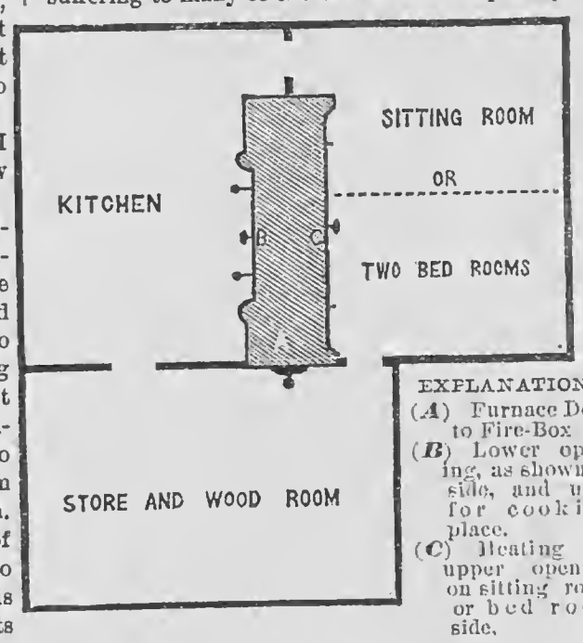
We desire to congratulate you upon the result of your efforts, and as "the proof of the pudding is in the eating," we respectfully suggest that you test our statements by an actual trial of the tea. We remain,

MARTIN GILLET & Co.

[Both these communications were received just too late for our last issue. The sample of tea was drawn and drank by six persons, all of whom pronounced it of superior flavor. The liquid tea was of a clear, amber color.—EDS.]

THE MENNONITE GRASS-BURNER.

A GREAT source of expense, inconvenience and suffering to many of the settlers in the sparsely-wooded prairies of the West, where transportation over bad roads is difficult, and coal mines are at a distance, is caused by the scarcity of fuel. Elsewhere throughout the country, also, are many places where a convenient supply of firing would add, not only to the comfort of many a farmer and farmer's family, but also considerably to the good man's bank account. Yet in many of these districts ample stores of excellent materials for fires suitable for all domestic purposes, are wasted in ignorance of the method by which they can be utilized in this way. The thought of burning grass or straw is generally confined to a bonfire or conflagration, and it is seldom the idea occurs that these substances might be profitably utilized for all culinary, heating and other domestic needs and conveniencies. Yet for years they have been so used by the Mennonites of Russia, and the colonists belonging to this sect, that have lately settled in Manitoba, Minnesota, Kansas, Dakota and Nebraska, have introduced the practice into this country.



GROUND PLAN.

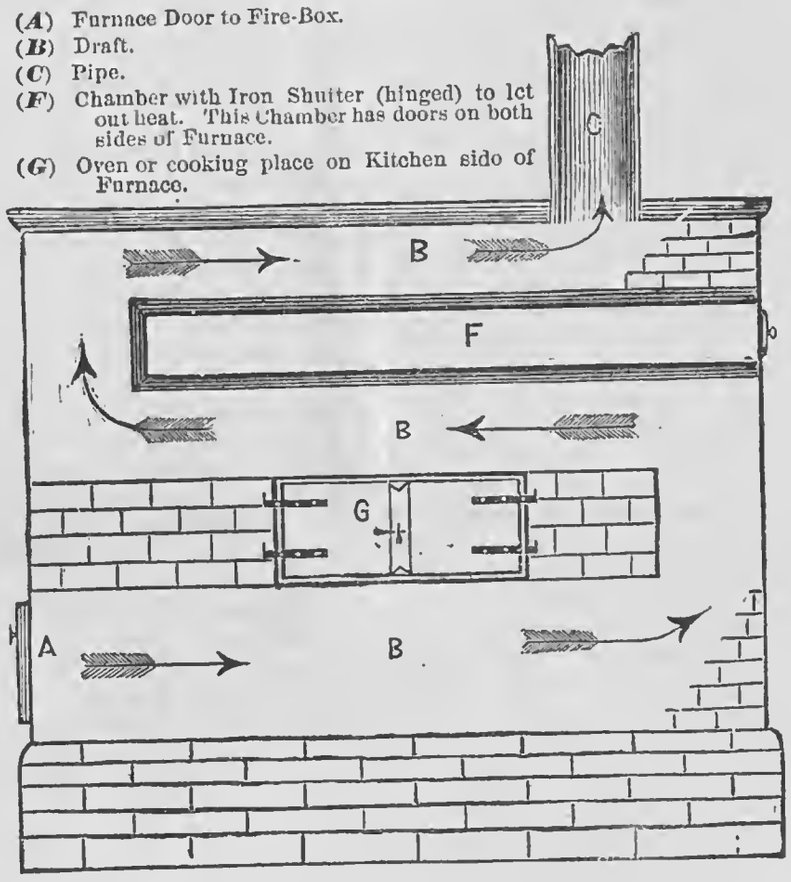
EXPLANATIONS:
(*A*) Furnace Door to Fire-Box
(*B*) Lower opening, as shown in side, and used for cooking place.
(*C*) Heating or upper opening on sitting room or bed room side.

The Mennonite Grass-burner is a simple, easily-constructed and inexpensive device, and there is little doubt that it, or improvements made upon it by American ingenuity, will ere long be extensively used in many parts of the United States. In constructing the furnace some employ brick, others stone, while others prefer a mixture of one part of sand with two of clay. Its position in the house is generally as central as conveniently possible, to promote an equal diffusion of heat on all sides. The furnaces vary in size with that of the house, but the principle of their construction is always the same, and is well examplified in the accompanying engravings. The length of the furnace here shown is five feet; its hight six; its width two-and-a-half; and there are 600 bricks in it. It may be said to have six stories: first, the ash-box; second, the fire-box; third, the oven; fourth, the smoke-passage; fifth, the hot-air chamber; sixth, the smoke passage either to a chimney or to a drum in an upper room.

The length of the fire-box is four feet, its width about a foot-and-a-half, and its hight the same. The Mennonites thrust the grass in with a fork as one would throw fodder into a rack. Both for cooking and comfort, two or three times in the twenty-four hours is found to be quite often enough to replenish the supply, if the receptacle is filled each time.

The accompanying illustrations will explain the design and construction of this useful contrivance more fully and and clearly than a page of writing—one among the many advantages of an illustrated paper.

EXPLANATIONS:
(*A*) Furnace Door to Fire-Box.
(*B*) Draft.
(*C*) Pipe.
(*F*) Chamber with Iron Shutter (hinged) to let out heat. This Chamber has doors on both sides of Furnace.
(*G*) Oven or cooking place on Kitchen side of Furnace.



SIDE VIEW.

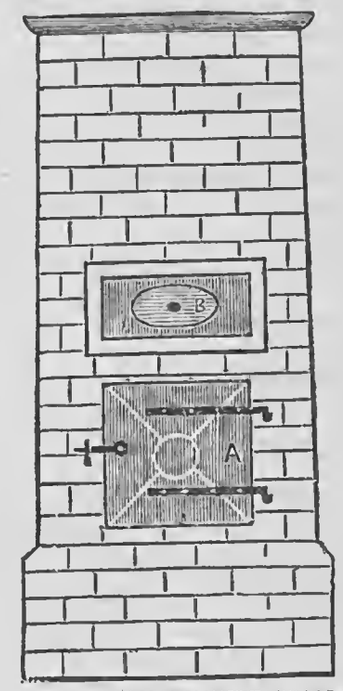
Your correspondent. A. E. BEADLE, says he has never seen mentioned in American catalogues the "English Vegetable Marrow." He certainly does not look very closely as the seed is offered in the catalogues of J. M. THORBURN & CO. of New York every year. He can see it in the catalogue for this year, and, Mr. Editor, I can show you a catalogue of theirs dated in 1828 which contains the article. X.

New York, May, 1878.

My Horse-radish took a great notion to seed this Spring. I notice over a dozen stalks; we have had it for eight or nine years but never had it seed before. I notice a variegated form of Lychnis in my perennial bed; every leaf is striped white, cream, and green, is it common? [We have never seen one.—EDS.]

I have a magnificent Pæony in bloom; flowers eight inches in diamater: very deep Crimson. I have eight others in bud; have a variety with foliage like Larkspur's. W. C. L. DREW.

El Dorado, Cal.



END VIEW OF THE "MENNONITE GRASS-BURNER."

(A) Furnace Door to Fire-Box. (B) Cooking place or Oven. This opening sometimes omitted.

NO TIME is so favorable to invest in real estate as when everything is depressed and money "tight." The farm announced for sale in another column is a bargain, and the gentlemen who have the matter in hand are trustworthy. They will supply particulars.

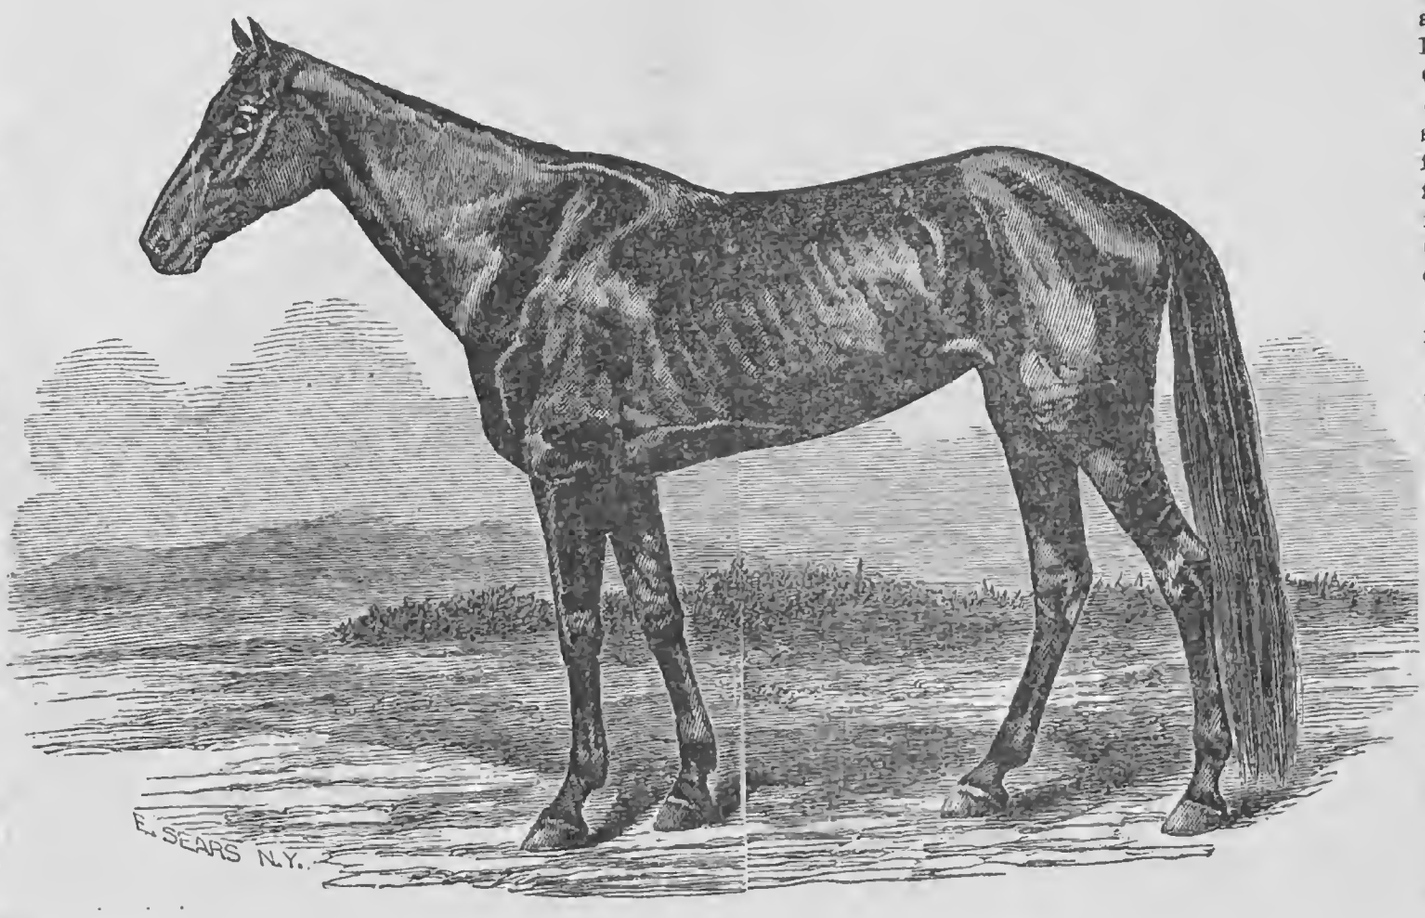
The Horseman.

NOTED TROTTERS.—No. 5.

GOLDSMITH MAID.

THE famous little mare that has made the name of Goldsmith Maid illustrious by winning, beyond all doubt, the highest honors of the trotting turf, was foaled in 1857, and bred by Jno. B. Decker, of Sussex County, New Jersey. Her sire was Edsall's Hambletonian, a horse afterwards purchased by Mr. R. A. Alexander, of Kentucky, who renamed him Abdallah, after his grandsire, who was the grandson of the renowned imported Messenger, already several times referred to in these sketches. Her dam was a nameless buckskin mare got by the elder Abdallah, so that she is very closely in-bred to the old grandson of Messenger, being by his grandson out of his daughter. Moreover, there was a great number of in-crosses to the Messenger blood in Abdallah's son, Rysdyk's Hambletonian, grandsire of the Maid. She is but little over fifteen hands high, but is long and low, with the general shape of a thoroughbred mare of good bone. In her youth she was remarkably independent and ungovernable; no fence could keep her in the pasture when she wished for freedom; she ran nearly wild until almost eight years old, and gave so little promise of her future excellence that at the age of eight she was sold by Mr. Decker to his nephew for $350. On his way home with his purchase, the latter met William Tompson, who straightway bought her for $460, in January 1865. In the following March, Thompson sold her for $650 and a buggy to Mr. Alden Goldsmith, of Walnut Grove Farm, Orange County, N. Y., and it is from this gentleman her name is derived.

Here, by the patient and skillful treatment of her trainer, she was cured of her wildness and timidity, while her strength and pace were greatly increased; and in August 1865 she trotted her first race at Goshen, N. Y., for a purse open to all ages, which she won in three heats, the fastest being 2.36. During the same fall she was beaten at Newton, N. J., and again at Goshen, after winning the two first heats. In the next couple of years she met with varying success, beating, generally, such flyers as Geo Palmer, Geo. Wilkes, Gen. Butler and American Girl, and being beaten occasionally by some one of these and, whenever they came in conflict, by Dexter and Lady Thorn.



GOLDSMITH MAID

After the purchase of Dexter by Mr. Bonner for $33 000 in 1868, and his withdrawal from the trotting track, the three great mares, Lady Thorn, American Girl and Goldsmith Maid, were considered nearly on an equality, and much curiosity existed as to which of this trio would permanently win the place of the abdicated monarch of the trotting track. The first of the three had the strongest claims to the foremost place, as, barring Dexter, she had repeatedly defeated the best flyers, but great hopes were entertained of the Maid, as she has been steadily improving from her first appearance on the turf. During this period of uncertainty she was sold to Doble and Jackman for $20.000, and though very unsuccessful during the early part of the first season with her new owners, later in the the season, at Buffalo, she won, in a race for $10.000, in three straight heats, 2 19¾, 2.19¼, 2.19¾. This was the first time that 2 20 had been beaten by one horse in three heats of a race. Shortly afterwards she was sold to one of the multitudinous Smiths of this city, whose property she still remains.

Since then, until her retirement from the turf for breeding purposes, at the close of the last season, her name has been constantly before the public in connection with the finest efforts of fleetness on the trotting track on every prominent course in the Northern States, from the Atlantic to the Pacific. A brief recapitulation of her best efforts is a record of the highest trotting excellence, not in this country only, or merely in these our days, but in the whole world and in all the time that has been.

1. She made, in harness, the fastest mile heat, at Mystic Park, Boston, Sept. 2, 1874, time 2.14.

2. The fastest second heat, at same place and time, 2 14.

3. Fastest sixth heat, Hartford, Sept. 1, 1876, time 2.19¾.

4. Fastest two consecutive heats—2d and 3rd—Buffalo, Aug. 3, 1876, time 2.15¼, 2.15.

5. Fastest three consecutive heats—1st 2d and 3rd—same time and place, 2.16, 2.15¼, 2 15.

6. Fastest six-heat race, at Hartford, Sept. 1, 1876, Smuggler winning first two, making a dead heat with Goldsmith Maid for third, and the Maid winning the next three; time 2.15¼, 2.17, 2.16¾, 2.17¼, 2 18, 2 19¾.

Industrial Implements.

AN EXCELLENT LAWN MOWER.

Awhile ago we received a Buckeye Lawn Mower for trial. This is placed before the public this season for the first. As requested we tried it thoroughly with results which justify us in highly recommending its use to our readers. The manufacturers, Mast, Foos & Co., Springfield, O., claim that it is light and easy to handle; that it requires very little power to drive it; that the ground wheels drive independently of each other, and that either wheel will drive

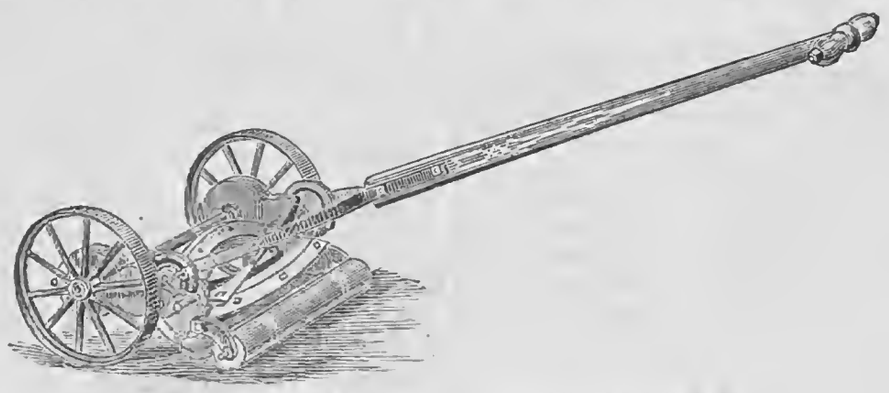
COOLER CAN.

the cutter; that it may be turned around in a very small space either to the right or left, and that it will continue to cut while turning; that this enables the operator to mow around shrubs, trees and small flower beds; that all the knives are tempered; that the machine is so constructed that one can mow borders to walks or flower beds; that all the working parts are encased, and it is not possible to clog the gearing or cutting with cut grass; that by a simple device the small roller in rear of cutter may be raised or lowered, thus regulating the hight the grass is to be cut. Three sizes for hand are made—12, 15 and 18 inch cut.

The manufacturers claim for this machine many other excellencies as to durability &c., the justice of which could only be tested by several seasons' trial. As it is, we are glad to be able fully to indorse the above claims and to assure our readers the Buckeye Lawn Mower will not disappoint them.

THE COOLY SYSTEM.

This system, devised by Mr. Cooley, is cheap and effective. It is the "deep-setting" plan so much talked about, and the principle is that milk enveloped in a low temperature will cause the cream to rise quickly and completely. Nature mingled the cream globules, the casein globules, sugar, etc,, with the water of the milk, each having about the same specific gravity. The cream globules are a little, but a very little, lighter than the water, and if left to Nature's laws will slowly rise to the surface, the heavier particles displacing them. The cream globules are poorer conductors of heat than the water and casein of the milk, hence they shrink more slowly upon the application of cold; if then,



THE BUCKEYE LAWN MOWER.

cold is applied to the milk, the cream globules being acted upon in a less degree than the water, are hastened to the surface; the watery portion being the most susceptible, chills first, shrinks, and forces the oily part to exchange places with it. The larger cream globules rise sooner than the smaller because each globule is covered with a coat of casein which is heavier than pure butter, and the smaller globules carry a proportionately greater quantity of casein, and hence rise more slowly. This being the theory, it only remained to test the practical effect, and to this end the Vermont Farm Machine Company have constructed an apparatus that combines both milk-vessels and milk-room, occupying for a dairy of twenty cows about the same space as a kitchen wood-box. The cans of milk (about 18 inches deep) are plunged beneath water of a temperature varying from 40 to 50° and the process may be said to be completed. The milk yields its cream quickly, and without the possibility of any deleterious effects from impure surroundings. The cans are not hermetically sealed, but the loosely-fitting cover of the submerged vessel admits of sufficient aeration and the purifying influence of the cold water acts favorably upon the milk. The slight difference between the temperature of the milk at the surface being about two degrees colder than at the bottom of the vessel, is found to hasten the process, sending the condensed watery portion near the top downward. The milk after parting with its cream by this process, is as sweet as when drawn from the cow, and is valuable for feeding, or for skim cheese. It is claimed that by this system the cream can be handled within twelve hours, or in other words, between milkings. The plan has great merit, and those interested may secure further information together with illustrations of the apparatus by addressing the inventor, or the Vermont Farm Machine Co., Bellows Falls, Vt., above mentioned.

THE "REINDEER" RAKE.

We are indebted for this improvement in rake and name to an enterprising manufacturer, Mr. Jno. Dodds, Dayton, Ohio, who places this implement before the agricultural public for the first time this season, after having submitted it to a thorough practical test the past year. We saw the rake for the first time at the N. Y. State Fair at Rochester, and a careful inspection seemed to substantiate the points made in its favor.

The "Reindeer" is a self-dump, made under a license of a combination of patents that cover about all the points of excellence found in the improved rake of to-day. Its construction is as good as improved machinery and the best material can make it. The axles are cold-rolled wrought iron, with solid hubs firmly fastened to the same. It is said to be the only self-dump rake without pawls or ratchets, and its steel pins are nearly or quite proof against wear and breakage. Cast steel teeth, twenty in number, tempered in oil, are hung in malleable thimbles in the rake head, constituting, as is said of the hornet's sting, the "business end" of the machine. The dumping gear is locked in, and there is no question about its ability to hold. The teeth will not drop back when not required to do so. The rake is firmly braced with wrought iron, and so strengthened that it cannot give down in the center. It is easily worked, and after discharging falls back into place with ease.

Mr. Dodds write us to the effect "that the 'Reindeer' was tested and exhibited at all the important fairs of the country last season, and was pronounced a vastly superior rake," and "that the heaviest implement dealers in the country are handling it this year" Also, that "the orders have been almost unprecedented, and will tax this extensive manufactory to its utmost to supply the demand." We think it will repay our readers to investigate its merits more fully than can be done in this notice.

TRE FOUNTAIN PUMP.

The subject of illustration, Whitman's Fountain Pump, is quite the most convenient little machine that has come under our notice. It is compact, emphatically portable, and adapted to so many and various uses as to make it a *multum*

in parvo. It is valuable to stock owners, is effective as an extingnisher of incipient fires, is an admirable sprinkler for trees, flowers, plants, vines, etc. It will clear drains, and in fact is a condensed fire engine, force pump and sprinkler. Its low price, simplicity and excellence of construction make it a most useful appendage to to the farm and country home. Mr. J. A. Whitman, Providence, Rhode Island, is the manufacturer.

COOLER CHEST.

WORCESTER'S KNIFE GRINDER.

The subject of this illustration is a little machine that should find a place on every farm of any consequence. Its low price puts it within the means of all, and the claim of the makers, Messrs. Livingston & Co., Pittsburgh Pa., that it will pay for itself in a season, seems a not unreasonable statement.

It is designed to sharpen the knives of mowers and reapers, and is, to that end, supplied with a solid emery wheel which is revolved against the knife at an exactly proper angle to get the required edge without waste of metal, or loss of time. The knife is held in a suitable vise that always adjusts it correctly. Water may be used on the wheel, but in either case it is so constructed that it is impossible to draw the temper from the steel. It is light and strong. A boy may carry it without inconvenience into the field. Its advantages are too apparent to be dwelt upon. The time and labor of one man are saved, the work is done more uniformly and quickly, and the knives may always be kept in prime

condition. The makers guarantee every grinder, and add that it may be returned at their expense and money refunded if it is not in all respects satisfactory.

The Swine-Herd.

THOROUGHBRED SWINE AND HERD BOOKS.

Since the National Swine Breeder's Convention was held at Indianapolis, Ind. in' 72, a commendable interest seems to have been developed all over the country in perfecting breeds of pigs, and in trying to maintain their purity by the organization of associations and the establishment of swine registries. Both of these ideas were recommended by the convention in the following report made by the committee on "What constitutes thoroughbred swine." "In the absence of any system of records by which pedigrees of swine are kept, your committee can only give an expression which, from the nature of the case, must be somewhat general. Only such breeds should rank as thoroughbred as are recognized in authentic history as of remote origin, and have steadily been bred in a line, resulting in the establishment of a fixed type, capable of transmitting itself with uniformity. Your committee would recommend that the leading breeders of pure bred swine from breeders' clubs, for the purpose of establishing herd registries, after the plan adopted by the breeders of thoroughbred cattle ,in order to secure greater uniformity, and to perfect, as soon as possible, the various breeds: J. P. Roberts, G. Sprague, Frank D. Curtis, Committee.

Mr. Roberts of Iowa, while signing the report, regarded it as somewhat ambiguous. What is a remote origin? Some had said twenty years; and if that was the understanding he was ready to vote for the report as it stood. Mr. Moore of Illinois, thought the report should be more definite. Some time should be given, and then the convention could understand what the report meant, and vote intelligently on its rejection or adoption. The public, two, could derive some definite idea from it.

Mr. Curtis explained that in the nature of things the language must be indefinite. Time alone did not form a thoroughbred race, but care and skill were necessary. A breed would make more progress towards becoming established in five years in the hands of some breeders, than in four or five times as long in the hands of other breeders. Mr. Rust suggested that the language be amended so as to read "Only such breeds should rank as thoroughbred as are recognized in authentic history as of sufficiently remote origin, that when bred in a line to result, etc. The suggestion was accepted by the committee, and the report adopted.

During the past winter, many of the breeders of Poland China hogs got together and organized an association, and made arrangements to have a herd registry, so as to keep the pedigrees correct and the breed pure. Col. R. M. Hoe, of Morrisania, N. Y., and Mr. Wm. F. Beach, of Jeffersonville, Ind., with others who are interested in the breeding of small Yorkshires, have begun a movement to secure an association and herd registry for this breed. Hon. Wm. M. Holmes, of Greenwich, N. Y., and Col. F. D. Curtis, of Charlton, N. Y., have begun the breeding of the Duroc pigs, and intend to keep a correct list of their breeding and pedigrees with a view of perfecting this class of hogs, and of making them thoroughbred as soon as possible. Some old families of pigs seem to have run out, doubtless for the want of a registry and careful breeding. We remember the Byfield and the Grazier as the old time families now not mentioned.

The Querist.

ANSWERS TO CORRESPONDENTS.

Manure for Root Crops.

E. E. Graves, Jefferson Co., N. Y., inquires whether sugar-beets, carrots, and turnips will be likely to do well on rich pasture land after corn without the application of any manure; whether guano, sown after the crop is up, is the best kind of manure for these roots; and if not, what is.

ANS.—A good fertilizer for root crops is the "blood guano" prepared by WING & EVANS. It is made from the blood and offal collected from the slaughter-houses and seems to be especially adapted to promote the growth of roots. It should be placed in the drill, or furrow, before the seed is sown and slightly covered with earth. The same plan must be adopted with all fertilizers which have strength enough to be of any benefit to the crop. This is particularly true of South American Guano. The earth absorbs the ammonia, which, if brought into direct contact with the seed or young plant, would burn it, or, at least, kill it. The surest method in applying fertilizers is to scatter them in the furrow and then either by hand, or with a rake or hoe, cover with earth or with a plow, and then put the seed on the top. To sow the guano or other fertilizers on the surface after the plants are up is not good economy or science, as there will be a great waste of the volatile properties, which are not lost when immediately covered in the furrow. Gypsum is the only fertilizer which should be sown over the young plant. When this is done, it has the effect to collect the ammonia from the soil and air, and retain it for plant-food. Well rotted barnyard manure is, after all, the best thing to depend on for a good root crop. The best of fertilizers will not altogether supply the lack of this.

To Prevent Cows from Sucking themselves.

J. C. Losel, Schenectady Co., N. Y. asks what will prevent a cow from sucking herself when a strap garnished with sharp nails, and placed round her nose, will not.

ANS.—If the strap, or muzzle around the nose is properly made, it is an effectual preventive for a cow sucking herself. The strap should be as wide as the space up to the eyes will admit and be garnished thickly with sharp spikes. The spikes or teeth in an old-fashioned wool hatchel are just the thing. Hampering from the head to each hind foot might stop a cow from this habit, unless she learned the trick of holding one foot forward. Covering the bag with a blanket of leather or thick cloth, would also keep a cow from getting at her teats. The blanket can be strapped over the back and held in position by strings tied around the legs. Smearing the under-side with aloes and pitch mixed together, will so disgust the animal that she will not attempt to meddle with the blanket. The blanket can be let down on one side to milk.

Something About Poughkeepsie.

H. C. Miller, Washington Co., Arkansas asks what is the population of Poughkeepsie N. Y.; the different kinds of manufacture carried on therein; its colleges and seminaries, the extent of its trade and the nature of its scenery.

ANS.—Poughkeepsie, the capital of Dutchess Co., 75 miles from New York City, had at the time of the last census, 1870, 20,080 inhabitants, of whom 4,425 were foreigners. There are in it three iron foundaries, two iron furnaces, a rolling mill, two ship-yards and dry-docks, several breweries, tanneries and manufacturies of agricultural implements, carpets, carriages, chairs, cooperage, cordage, dye-stuffs, files, edge tools, glazed paper, gloves, hardware, pins, shoes, soap and candles, spring beds, etc. The city has six National Banks, with an aggregate capital of $1,585,000, a savings bank and an insurance company, good graded public schools including a High-school department, Eastman business college, and about 15 private schools and academies, a free city library of upwards of 8,500 volumns, 20 churches. About two miles east of the city are the buildings and grounds—200 acres—of the Vassar College for young ladies, which in 1875-6 had 370 students. Its trade with the rural portion of Dutchess County is quite extensive, while its large manufactures bring it into commercial relations with nearly all parts of the country. The greater portion of the town is on a table land 150 to 200 feet above the adjacent Hudson River. It is regularly laid out, with pleasantly shaded streets and many elegant residences, and good public buildings. It is lighted, night times, by gas, and has a line of street railroad. The scenery along the Hudson, above and below the town, is very fine.

Chufas Again.

G. A. Blakely, Rock Co., Wis., asks for information about the value of Chufas as a root crop and how to cultivate them.

ANS.—In our issue of Dec. 15 will be found an engraving of the Chufa and interesting details of the plant. We may here briefly answer the above question as to culture: Plant the tubers in drills three feet apart, placing them a foot apart in the drill and covering them an inch or so deep. The present is early enough to plant them. As soon as the grass-like leaves appear, a cultivator may be run between the rows. It is best to cultivate them level. Afterwards it is only necessary to keep free from weeds. Half a bushel will seed an acre. Their value is chiefly as a food for hogs. There is no food they like better or will fatten upon quicker.

Hardening Butter.

Another Subscriber—who seems to live nowhere — asks for instructions for hardening butter.

ANS.—To keep butter firm and solid during the hot weather in summer, the following method is largely in use among good butter-makers in England. Pulverized carbonate of soda and pulverized alum, at the rate of a teaspoonful of each, are mingled together at the time of churning and put into the cream. The butter comes out firm and solid and with a clean, sweet flavor. The powdered carbonate of soda and alum do not enter the butter, but after acting upon the cream, pass off with the buttermilk. The ingredients should not be mingled together until they are wanted for use, just when the cream is in the churn ready for churning. Another—and perhaps the best method for hardening butter—is to keep it in a cool cellar, where the temperature is kept even by means of ice, or its construction, and then carrying the article to market in refrigerator pails or other receptacles.

Hen Manure for Tobacco.

Van, Conquest, N. Y., inquires the best way to handle hen manure to be used in the hill for tobacco. He has used it with good results on corn after having boxed it in order to heat it, then mixed it equal parts with plaster and leached ashes.

ANS.—Treated in a like way, it would have a good effect also on tobacco. A good way is, two or three weeks before it is wanted, to pile it up in a dry place, thoroughly broken up, and mixed with plaster, say at the rate of a barrel of plaster to one or two of manure. In a few days it will commence to heat, and the ammonia which is always given off by heating manure, will be arrested by the plaster. After standing a few days more, it should be worked over, and again left, when it will soon be thoroughly pulverized and fit for use. Three or four times its bulk of dry muck, or rich mold, should always be mixed with so powerful a fertilizer as hen manure before it is used, and care should be taken that the seed does not come in contact with it.

Plan of a $200 or $300 House.

Z., asks the RURAL to furnish a plan of a house that could be built, above the cellar and exclusive of painting and shutters, for from $200 to $300.

ANS.—A plan that would answer Z.'s purpose excellently, was published in the RURAL for Dec. 1st last year, to which we refer him. We trust that by the time Z. writes to us again, he will have completed his house, for in that case he will be able to comply with the requirement of all journals, that their correspondents, to merit attention, must send their names and addresses. The house built, he will have an address which he can mention. The sum mentioned above, however, is hardly enough to pay for a house of any architectural pretensions, yet many houses costing even less than this modest sum, have by the energy, judgment and industry of their owners, been soon metamorphosed into handsome mansions.

Beaucarnea Recurvata.

A. C. E., North Linndale, Ohio, asks where can Beaucarnea recurvata be purchased, whether it is sold by sprout or seed, and what is its price.

ANS.—So far as we knew the plants alone are for sale. Several of the catalogues which we have noticed of late offer them and give price.

They may be increased by cuttings when cuttings can be obtained, and by seeds which are imported from Mexico. We do not know of a plant that has bloomed in this country. Because of its flowing, graceful yet odd habit; because of the little care it requires to keep it in a perfectly healthy state, and because it is as desirable for an out-of-door as for a conservatory plant, it is strange that one meets with it so seldom.

Miscellaneous.

A Subscriber—who also lives nowhere—having read in an April RURAL of a large, flowering, double-fringed Petunia from Germany, and also of a work entitled "Simple Truths," by ROBT. COLYER, of Chicago, asks where each can be got, and the price.

ANS.—With regard to the Petunia, most of the catalogues noticed in our late issues advertise the one referred to. Price 50 cents per packet. The work, Simple Truths, is published by Lee and Shepherd, of Boston, Mass., who will furnish book as well as all information.

Miss V. S. C. asks for name and address of the principal of the Horticultural School, in Iowa.

ANS.—We do not know of a Horticultural School in that State. Dr. A. S. WELCH is president of the Agricultural College, Ames, Iowa.

H. P. Heil, Clyde, Wayne Co., N. Y. wants to learn where he can purchase a good self-binding reaper.

The following firms make good self-binders for sale: C. Aultman & Co., Canton Ohio; Aultman, Miller & Co., Akron, Ohio; W. A. Wood, M. & R., Mach. Co., Hoosick Falls, N. Y.

F. C. Denton, Daleville, Botetourt Co., Va., asks by whom is the Alden's Fruit-dryer manufactured.

ANS.—By Jno. Zimmerman, Mansfield, Ohio. Answers to other questions probably next week.

Everywhere.

GATHERING CATTLE ON THE PLAINS.

ELBERT CO., COL., April 22.

IT is difficult for any one that has never been here to understand, how the cattle trade is carried on in this country. People generally imagine that the stock-men see their cattle every day and milk their cows and feed their calves as they do in the Eastern States, and they will be surprised when I tell them that stock-men owning thousands of head, may not see twenty of them from November until the "round-ups" begin to come in, in the spring. Many readers of the RURAL will not know what I mean by the term "round-up." I will therefore tell them:

Every man knows his cattle by the brand; that is, a mark or letters made on the cattle with a hot iron and so that it can be easily seen. In the winter the cattle all scatter or drift with the storms for a hundred miles or more. About the first of May, or when the grass is well started, the stock-men send out their "outfits" each consisting of a wagon with provisions, bedding, etc., and a cook together with two or more herders or "cow-boys" as they are called here. There are three or four horses to every man, and these are sent by the stock-men into all the adjoining counties to collect the animals. The "outfits" from each neighborhood meet at an appointed place. These places of meeting present a lively appearance for a few days. There are perhaps one hundred wagons, one thousand horses, and from two to four hundred men. After making all arrangements these scatter, surround the county and drive all the cattle to one place. This is called the "round-up."

When they are all gathered there will be from eighteen to twenty thousand; then the men from one county or neighborhood proceed to separate the cattle belonging to their county or neighborhood from the main herd into a herd by themselves, holding them at a short distance from the main herd. This is called "cutting-out". While this is being done, other men are "cutting-out" their brand and so on, until the large herd is divided up into small herds. Then a part of the men start to attend other "round-ups" and a part start for home with the cattle already gathered, stopping at every ranch and "cutting-out" the cattle belonging to the place and then driving on to the next, and so on until the last man gets home with his cattle. These "round-ups" are coming in all summer and, as they come in, the cattle are held on the range by rounding them in every few days, to brand calves and ship beef. This is kept up until all the "round-ups" are in, all the calves branded, and all the beef shipped. Then the remaining cattle are all turned loose until the next Spring.

The men from this section start for the Bent County "round-up" to-morrow and expect to return and meet at the appointed place for this county "round-up" on the twentieth of May.

M. V. SNYDER.

FRUIT GLEANINGS.

EL DORADO CO., CAL., April 29, 1878.

THE season still bids fair to be a remarkably prosperous one. April 14th to 18th looked very threatening, and for several days it was doubtful, but finally it cleared off without any damage. Pears have set finely, the trees are fairly crowded with fruit; it will be necessary to remove at least two-thirds, if we would have fine specimen fruit. It is useless to let all the fruit that has set remain; and where fruits of the highest perfection are wanted they must receive a timely thinning. In our section there have been several trees killed by blight this spring. This is the first time that this disease has been noticed among our pear trees. That it is of fungoid origin there is no doubt; but as to a remedy, no certain specific has been discovered. I think Bartletts are less liable to it than others. Peach trees are badly injured by the curl-leaf. I am of the opinion that this is also due to a fungoid disease, young trees are not as badly affected as older ones. The crop had set finely and had not the curl-leaf appeared, we would have had a large harvest. As it is, it will perhaps not be over three-quarters of a crop. Apples will be in abundance. They will need thinning where fine fruit is wanted. The Woolly Aphis is the worst enemy we have for our apples and as it attacks the roots it will be a hard enemy to deal with; trees planted in hard ground are less liable to its attack. Plums are doing finely; the trees have just about a fair crop on; the common green louse or Aphis is the only insect I have ever seen on the plum here, and soap-suds settles it quickly.

Strawberries promise us a bountiful harvest. Plants set out as late as the middle of December are loaded with fruit. Currants and Gooseberries look healthy. Blackberries are just commencing to bud. W. C. L. DREW.

RURAL CRITICISMS.

SOME twenty years ago, or more, a village postmaster handed me a copy of "MOORE'S RURAL NEW-YORKER," which had been sent to him for distribution. Postmasters at that time were more attentive and accommodating than they are now, as they were then much more dependent for position upon the people than upon party politicians. I took it home for examination and was so much pleased with it, that I became a subscriber. Shortly afterwards the war broke out, and all communication between the North and South, except between fratricidal foes, was interdicted, and for five years I saw nothing more of the "RURAL." After the war, the first investment I made was for sperm candles and kerosene oil, as we were reduced to pine knots, having exhausted tallow candles and beeswax coils, and with a good light, good reading matter was suggested. I again became a subscriber of the "RURAL," but bad Government, hard times, and other casualties, caused a break in my subscription until this year. I think this explanation necessary, not only to show my appreciation, but my long acquaintance with the RURAL, and consequently my opportunity for judging of its merits and demerits. I say *opportunity* designedly for my ability is quite another matter, so I don't expect to arrogate too much, as I am by no means a Sir Oracle.

No one who has known the RURAL as long as I have, can fail to see the vast improvement which has been made in its appearance. From a single sheet it has grown to a weekly volume, and its mechanical execution, including the type and illustrations, is faultless. Of course, it contains five times as much matter as it did twenty years ago, and where there is so much it all cannot be above criticism. Were we asked what are the excellencies of a well-edited agricultural paper, we would say, facts! Theories and speculations are absolutely worthless. A farmer has too much work to do to waste his time upon anything else, and these facts and experiments must be as plain as day; so plain, that way-faring men, though fools, shall not err therein.

How often are accounts of most important and interesting experiments rendered absolutely worthless by the omission of some fact necessary to be stated, or by a statement of facts, that no one can understand. Nor has a farmer time to waste upon elegant phrases, well turned periods or "highfalutin." He wants the grain and not the chaff, and the cleaner the winnowing the better is he pleased.

I will try to illustrate my meaning by a running commentary upon some of the prominent articles in the number of Feb. 16th, which I have before me.

The first article is on "Agriculture and Education in the United States, No. 5," by Prof. I. P. Roberts. The Professor lays out a big clearing, and he takes up two or three columns to demonstrate that the Press is a great power, and has benefited agriculture; that agricultural clubs, County and State, are very useful; and that since his boyhood the country has improved, etc. He commences in the following manner: "I am not a prophet, nor a son of a prophet, but it is the part of wisdom to look back over the past that we may be able to learn something of the future. I may be of too sanguine a temperament to judge wisely, but when I compare the period of my early boyhood with the present as to education, methods and results; as to comforts, enjoyments and wealth, etc., I cannot but believe that the future has a greater prosperity, knowledge and happiness in store." Certainly, but the shuck is entirely too big for the nubbin.

The next two articles, by Col. Curtis, and by Prof. Shelton, are most admirable, and are as full of information and instruction as an egg is of meat. Every farmer should read these papers.

Then the next three pages are filled with many good things pleasantly told, and we come to the Domestic Economy column, where we have "Siftings from the Kitchen Fire" by Annie L. Jack. Whether she is single or married I do not know, but I do know if she is not married she ought to be. If she is as graceful in person as she is with her pen, and as profound in example as she is in precept, she is certainly a treasure!

The next article, which arrests my attention, is the one by Faith Ripley on "Decorating Pottery," and I commenced it with the hope of learning the *modus operandi* but was disappointed, and think this must be the last half of the subject. The author has kindly proffered to give any additional information on the sub-

-ject, and I hope she will yet give the reader of the RURAL more definite instructions upon a very beautiful art, which she seems to understand so well and thoroughly. J. WIST, SR.

Spartanburg Co., S. C.

RURAL SPECIAL REPORTS.

SHERMAN, Chaut. Co., N. Y., May 6, 1878.

EVERYTHING hereabouts is in a fine growing condition. Farmers have their grain nearly all sown. Quite a quantity of wheat has been sown here this Spring. The fruit prospect is good; also prospects are excellent for a good hay crop.

We are blessed with peace and plenty, and the Lord seems pleased to smile upon our pathway. Sherman boasts of supporting five church organizations, a fine Union school, a live local paper, the Chautauqua News, and as a community we are strictly temperate. No liquor saloons are allowed in our town. Fair Point, on Chautauqua Lake, is known as a popular summer resort.

The National Sunday School Assembly is held here each summer. Dr. J. H. VINCENT, of your city, is President. During the session all the eminent divines of the country and the leading Sunday School and Temperance workers of the day, are present, including Rev. JOSEPH COOK, Rev. Dr. DEEMS, FRANCIS MURPHY, JOHN B. GOUGH, etc.

President HAYES and party are expected this summer. Several farmers are going into cheese-making here this season. As an agricultural community we have great reason to be thankful for the many blessings it is our lot to enjoy.

May the God of all grace continue to remember us in much mercy! M. L. D.

WEST JERSEY, Stark Co., Ill., April 30.

WE have had splendid weather this month with the exception of the last week which has been quite cold and rainy. There were some fears of frost, but the weather is somewhat warmer though still wet. Most of the farmers are ready to plant corn as soon as it quits raining. Some few had corn planted two weeks ago. Prospects are fair for a good yield of fruit of all kinds. Quite a severe wind and hail storm passed through this State, on the 21st, some twenty miles north of this, doing a great deal of damage to the fruit trees; also washing out bridges and demolishing buildings at a fearful rate.

MRS. H. E. McC.

Dunnsville, Essex Co., Va., May 4, 1878.

We have had as usual all over the Continent a very mild winter. Vegetation full three weeks earlier than usual. Wheat a very fine growth, but wherever we hear from it is very seriously injured with rust. It is now in full bloom; grass is very fine; stock in good condition. Some families have sheared their sheep but ordinarily it is too early. Abundance of fruit except pears. Corn looks well for so early in the season; grain is low; stock also; money scarce; but the country has very much recuperated since the war. Good industrious mechanics are very much needed in tide-water Va; small farmers also. R. S.

Corning, Steuben Co., N. Y. May 9, 1878.

We have had rain nearly every day for three weeks making spring somewhat backward although most of the farmers have their grain sowed. Shall plant corn next week.

Every thing is nearly a month earlier than ever know in this locality before. There is every indication of an immense amount of fruit. Clover is splendid; will be fit to cut in two or three weeks. From experience I am convinced that the poorest soil can be brought up and made very fertile, by the use of clover alone.

CARLISLE, Schoharie Co., N. Y., May 6.

WE have been having plenty of rain of late. Yesterday it rained from the west all day; this morning the sky is clear and the air warm. Grass and winter grain are far ahead of any thing I ever saw in this section before. Spring grain is not half sowed yet; it will be late, for the ground is so wet that it will be a number of days before any sowing can be done, even if we have fair weather. Grain sowed looks nice and green; the rains have not hurt it yet. W. S. S.

MIDDLESEX Co., N. J., May 4.

WHAT extraordinary hot weather for the season!—88° in shade several hours yesterday, and 86 to-day. Things generally including weeds are growing freely. I have Strawberries in full flower, Peas 17 inches high, and Asparagus could be cut twice a day. J. T.

LITTLE FALLS, N. Y., May 11, 1878.

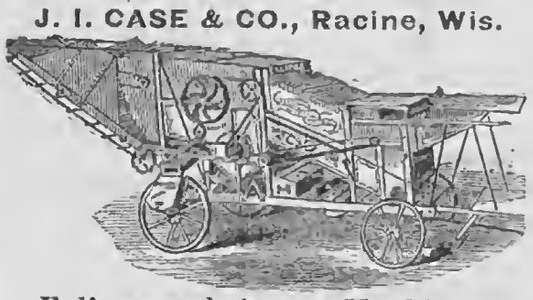
IT snowed in Utica this morning and we have been having cold showers all day. There was a light frost on the hills last night, with the prospect of a heavy one to-night in case it should clear up. Overcoats are in demand. W. H. K.

UTICA, N. Y., May 10, 1878.

IT is very cool here to-night, and we shall probably have a light frost. There is considerable apprehension that this unexpected cold spell will seriously injure the fruit crop which the earliness of the season has brought unusually forward. W. L. J.

Implements and Machinery.

UNRIVALED POPULARITY.
Largest Manufactory in the World
—OF—
THRESHING MACHINES,
THRESHER ENGINES,
Mounted, Down & Tread Horse Powers.
J. I. CASE & CO., Racine, Wis.



Eclipse and Apron Machines.

Will Thresh and Save, per day, 1,000 bu. Wheat, 1,500 bu, Oats, 400 Flax, 300 Timothy Seed.

Durability unparalleled. "19 successive Falls and frame staunch yet." "18 seasons' work with same Separator and Power." "Every Fall since 1859, and good now."

Most Complete Assortment of Threshing Machinery made. Eight sizes of the Apron Separator and three of the Eclipse.

Finest Threshing Engines—8, 10, 15 Horse Power. Combine Safety, Economy, Power, Strength, Finish.

Splendid List of Horse Powers: Mounted Pitts, 4-wheel Woodbury, 2-wheel Woodbury, Down Pitts, Down Climax, 1 and 2-Horse Sweep, Tread Power.

Catalogues, with Full Particulars of improvements, etc., sent free on application.

Established 1845.

Syracuse, N. Y., and Chicago, Ill.

Implements and Machinery.

Horse-Powers,

For One, Two and Three Horses.
MACHINES FOR
Threshing and Cleaning Grain
and Sawing Wood.
Patented, Manufactured and Sold by
A. W. GRAY'S SONS,
Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

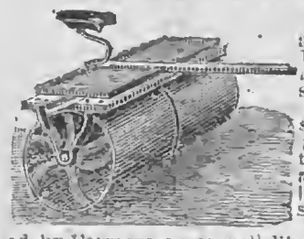
We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Circulars and Price Lists free. Address as above.

IRON FIELD ROLLERS.



These Implements are made of *Cast* and *Wrought Iron*, insuring the wearing of the same a life-time.

Efficient in preparing soil for proper and *sure germination of seeds* after sowing, by their action in pulverizing, levelling and rendering sufficiently firm.

No tool so much needed by Farmers or so well liked where known. For prices and further information, address
A. P. DICKEY, Racine, Wis.

No. 23 So. Sixth St., Philadelphia.

NEW & RARE ROSES.

We offer from our list of over 500 varieties of Roses. Well grown plants from Pots or Field Culture. One-year plants, Hy. Perp., our selection, at $3 per doz., $20 per 100. Teas and China, $2.50 per doz., $16 per 100. Young plants per mail, $1 per doz., $8 per 100. Also the rarest and choicest Evergreen and Ornamental Trees and Shrubs of all varieties for planting in Lawn, Yards, etc.
MILLER & HAYES,
MOUNT AIRY, PHILADELPHIA, PA.

RARE EVERGREENS,
IN QUANTITIES AND AS CHOICE SPECIMENS.
SPECIALTIES: Magnolias, Japanese Maples, Rhododendrons, Hardy and Chinese Azaleas, Roses and Camellias.
An immense collection of Fruit and Ornamental Trees and Shrubs. All THE VERY LATEST NOVELTIES. Price-List FREE. Descriptive Catalogue, 10 cts.
One of our firm makes studies for picturesque lawn planting, in conjunction with J. WEIDERMANN, author of "Beautifying Country Homes." Planting maps free to purchasers.
PARSONS & SONS CO. (Limited,)
Kissena Nurseries, Flushing, N. Y.

LOVERS OF RARE FLOWERS. It will astonish & please Free to address. ELLIS BROS., Keene, N. H.

THE MILFORD BASKET CO. are now prepared to furnish (at *Reduced Prices*) the Square Verbena Basket, Quart, Pint and ½ Quart Berry Basket, with or without crates. Send for price list.
MILFORD BASKET CO., Milford, Del.

SAVE YOUR APPLE CROP.—Send 25c. for sample prop. Sure death. E. RUHLMANN, Lockport, N. Y.

Miscellaneous.

OUR IMPROVED PEST POISON

is a SAFE, sure and cheap destroyer of the POTATO BUG. Currant Worm, and all Insects that Prey on Vegetation. Warranted to kill Five Bugs where Paris Green kills One, yet it is SAFER TO USE, and is not injurious to plants. Costs only 25c. to 50c. per acre. ½ lb box sent free by mail for 30c. Send for circular with hundreds of testimonials.
Our Cabbage Worm Destroyer is NOT AT ALL POISONOUS, but sure death to the worm. Sample for trial sent free on receipt of 15 cents. POSTAGE STAMPS ACCEPTED. Discount to the Trade.
KEARNEY CHEMICAL WORKS, J. R. DEY, Agent, P. O. Box 3039. Office, 66 Cortlandt St., New York.

The Science of Life;
OR, SELF-PRESERVATION.
Two hundredth edition, revised and enlarged, just published. It is a standard medical work, the best in the English language, written by a physician of great experience, to whom was awarded a gold and jeweled medal by the National Medical Association. It contains beautiful and very expensive steel plate engravings, and more than 50 valuable prescriptions for all forms of prevailing diseases, the result of many years of extensive and successful practice. 300 pages, bound in French cloth; price only $1, sent by mail. The London Lancet says:—"No person should be without this valuable book. The author is a noble benefactor." An illustrated sample sent to all on receipt of 6 cents for postage. Address DR. W. H. PARKER, 4 Bulfinch St., Boston. The author may be consulted on all diseases requiring skill and experience.

SUFFERERS from NERVOUS DEBITITY etc., can learn of a certain and speedy remedy, *free*. Address DR. JAQUES & CO., 130 W. 6th St., Cincinnati, Ohio.

30 Fashionable Cards, all New Styles, no two alike, with name 10c. I. Terpening, Cobleskill, N. Y.

25 FASHIONABLE CARDS, no 2 alike, with name, 10c., post-paid. GEO. I. REED & CO., Nassau, N. Y.

50 BEST CARDS, no 2 alike, printed in Crimson or Jet, 13c. Clinton Bros., Clintonville, Ct.

25 Styles of Cards, 10c., or 10 Chromo Cards, 10., with name, *Outfit* 10c. J. B. Huested, Nassau, N. Y.

30 Mixed Cards, Snowflake, Damask, &c., no 2 alike with name, 10c. J. Minkler & Co., Nassau, N. Y.

25 Cards, 25 styles, 10c., or 10 Chromo Cards, 10c., with name. J. B. HUSTED, Nassau, N. Y.

50 Best Mixed Cards, with name, in case, 13c., or 25 no 2 alike 10c. Outfit 10c. Dowd & Co., Bristol, Ct

Agents Wanted.

BIG PAY to sell our Rubber Printing Stamps. Samples free. Taylor, Bros. & Co., Cleveland, O.

IF YOU WANT THE BEST MONEY making business in the known world, address, *at once*, Box 155, Brighton, Ont.

$350 A MONTH.—Agents wanted. 36 best selling articles in the world. One sample free. Address JAY BRONSON, Detroit, Mich.

SALESMEN WANTED $125 A Month and Expenses selling to DEALERS. SAMPLES FREE. Send 3c. STAMP to insure answer. S. FOSTER & CO., Cincinnati, O. CIGARS

$2500 A YEAR. Agents wanted. Business legitimate. Particulars free. Address J. WORTH & CO., St. Louis, Mo.

$1200 Salary. Salesmen wanted to sell our Staple Goods to dealers. No peddling. Expenses paid. Permanent employment. address S. A. GRANT & CO., 2, 4, 6 & 8 Home St., Cincinnati, O.

$3 GOLD PLATED WATCHES. Cheapest in the known world. *Sample Watch Free to Agents.* Address, A. COULTER & Co., Chicago.

SATURDAY, MAY 18, 1878.

STOCK HUSBANDRY.

AMERICAN agriculture will date a new era from the discovery of a cheap and safe method of shipping its meat, fresh in the quarters, for European consumption. It is not simply the new market opened for our meat that is so significant of future profit, but it is the stimulus that this will afford the American farmer to study the best system of stock-keeping, which must be the foundation of any permanent system of profitable agriculture. Any country that depends largely upon the sale of the raw material of its crops to be used in other countries to feed their population or stock, is on the sure road to deterioration and decay. Stock feeding must be the great reciprocating agency between production and compensation of the soil. It matters not how much production may be stimulated if its compensation be equally great. France and Germany have learned to produce their immense consumption of sugar from their own soil by the culture of the sugar beet, and yet both countries carry more stock than before. The refuse of the beet pulp, after the extraction of the sugar, contains all the valuable elements taken from the soil, and this, being fed to stock, returns them again to the soil. But suppose these beets had been sold and shipped out of the country, what would have been the result during the last half century?

This impetus given to cattle raising in this country will soon show our farmers the folly of shipping ten pounds of corn at the price of one pound of beef, and paying the immense difference in transportation out of their own pockets. The corn will be fed, the fertilizing elements going back to the soil, and the concentrated product exported at one-eighth the cost with a liberal profit. This market comes also on just the right terms to produce the best effect upon the character of our agriculture. This beef and mutton must be of the best quality, or it cannot be sold except at a loss. The farmer, therefore, who would feed stock for the foreign market must study how to produce the best animals; must study the whole subject of breeding and feeding. This will be a powerful incentive to education where most needed. Stock husbandry must hereafter become one of the largest specialties in our agriculture, and it will be our aim to keep the readers of the RURAL thoroughly informed of its progress.

PUTTING OUT BEDDING PLANTS.

IN our desire to fix up our gardens and to get rid of the care of house-plants that have become etiolated or diseased, we are tempted to put them out before danger of frost is over. The present early spring makes us more than usually perplexed. The ground, however, is becoming warm, and we do not think it unwise to accept the season as we find it, and to put out our bedding plants at least two weeks earlier than in past seasons. It is impossible to avoid some risks in this latitude, as, judging from our own section of country, frosts are not surprising visitors as late as the first of June. At any rate we need no longer fear frost from which a very slight covering will not prove an effectual protection. Turn out all plants which have been raised from last fall's cuttings with as little disturbance of roots as possible. When older plants are found to be root-bound, the compact mass should be broken so as to disengage the entangled roots and give them a new direction. The neglect of this often prevents a plant from flourishing—for the hard mass of roots will throw off any wet that falls upon it, and the plant will suffer in consequence. It is sometimes a good plan to place such masses of roots and earth in warmish water until every part has become saturated. Then the fibers may be disentangled without injury. In transplanting, press each plant firmly in the soil and give it a good drenching. It should, however, be borne in mind that weakly plants, if the ground is already moist, are not benefited by water. The roots, in fact, will extend themselves more rapidly in a dryish, warm soil than in one made cold and soggy by over-watering.

PLEASING THE CHILDREN.

SOME little girls, the youngest class of a private school in an adjoining city, following the custom of their elders, determined, a few days ago, to hold a fair for the benefit of some orphans. The matter had been fully and properly canvassed, price of admission (five cents) agreed upon, fancy-work commenced, contributions solicited, lotteries arranged, and all seemed to be working nicely after the manner of grown folks. The question *where* the fair was to be held was the only one unsettled, and this for a while bid fair to be an obstacle that would block the wheels of progress and turn into an utter failure an enterprise that had been commenced with such high hopes of abundant success. At whose house shall the fair be held? There was sickness at one, company at another; one's mother was too busy and another's thought it would be too much trouble. At last a little tot, the tiniest of the class, said, "I think you can have it at our house. My mother says nothing is too much trouble when it pleases her children. I know she will be glad to have you come."

Thus spoke the child of a wise woman. We want no further evidence of her wisdom than the testimony of her child, given in that simple, artless way. We wish we knew her, that we might do her reverence in person as we do now in spirit. Brighter than any jewels in Victoria's crown shines her motherhood. For her example in the treatment and home education of her children she deserves the thanks of the world. But do we not see, in the effect of the teaching of this mother in a more lowly station, the same wise treatment that produces the same effect on her children and all around her? Is there a mother of any one of those little school girls, who will not feel a reproof when she hears her child say—"MARIE's mother says nothing is too much trouble to do for her children." If there is, we are sorry for her, and for her children and her children's children.

Home influence is in this country too often unappreciated. Parents are too much occupied with the labor of accumulating worldly wealth to attend to the home instruction of their children. They are entirely willing to give all the money necessary to pay for instructions in school or college, but cannot spend the time to give them personal attention.

The education of children should begin with their earliest infancy. Lessons of obedience, respect, confidence and love should be taught long before school days commence, and be taught in a spirit of confidence and love. When your child believes in you and knows that you are willing to do every possible thing you consider for his good; when he trusts you because there has never been occasion for doubt, you have laid a foundation for an education that will be excellent even though that child never sees the inside of a school-house. What greater confidence can be expressed than that by the child who said, "It is true, for my mother says so, and when she says a thing is so, it *is* whether it is so or not." Not very correctly put, perhaps—but we all know what it means—that if mother says a thing is so, it will prove to be so, no matter how improbable it may look at present.

This topic furnishes a good opportunity to introduce an argument in favor of the education of women, but we will not improve it further than to say that in our opinion if liberal education can be given only to a part of the family, the girls should have it. The influence of an educated mother in a household can scarcely be overrated. She is with the children every hour of their infancy, just when the twig that shall grow to be the tree is susceptible of being bent. And words spoken in a proper spirit, at a proper time, are seeds sown that will bear rich fruit in after years.

There is a little book entitled Bits of Talk About Home Matters. We wish it could be read by every woman in the land. There is many a child that would be the gainer by it. And many a mother, we think, would gather wisdom from its pages.

THE JAPAN MAPLES.

OF the many beautiful hardy plants we have been among the first to commend to the public, there are few which promise to give a keener satisfaction than the Japanese Maples. Of these, it will be remembered, sketches of leaves were presented in our issue of June 1st, '76. There is hardly any doubt of the hardiness of these beauties for this climate, while for intricacy of leaf and delicacy and richness of coloring, we do not know of any other hardy trees that will at all compare with them. We do not understand why these Maples are so seldom referred to by English horticultural journals unless it is that the climate is less favorable to them than ours. Certain it is that all of our friends who have seen these exquisite plants, are quite charmed with their appearance, and we know of several gentlemen who at a considerable cost have purchased a specimen of each of the many varieties now offered for sale. In the matter of urging certain shrubs and trees upon the notice of our friends, we have endeavored to be both well-advised and conscientious, so that we could not be regarded by those influenced by our words as a cause of disappointment and so that we might both inspire and maintain their confidence. With such thoughts quite alive in our minds we are ready to repeat all we have said in praise of the Japanese Maples.

Suggestive.—Attend to Roses. Look to the buds inserted last summer and cut off those on the stocks that interfere with their growth. Give liberal dressings of manure if not already done. All sorts of bedding plants may be set beside spring bulbs, such as Tulips, Hyacinths, &c. Then when the foliage of the latter begins to wither, it may be cut off at the surface of the ground and the beds remain entire to the bedding plants. Keep down all blossom shoots of Rhubarb, which only exhaust plants. Weed all onion and carrot beds assiduously, and give the Asparagus plot careful attention. Nothing is gained by putting out Egg Plants, Peppers and Tomato plants before the ground is warm and the weather unmistakably settled. Sow radishes every week. Also broad Beans, Peas and Sweet Corn. Keep the mixture of sifted coal ashes, sulphur and hellebore, recommended in Brevities constantly on hand and ready to be used after every shower or oftener if needed. Look to the leaves of fruit trees and destroy every vestige of tent-caterpillars. The above mixture, if thrown up among the leaves of trees infested with slugs while the dew is upon the leaf, will dislodge them at once. Finally, consider how much more satisfactory a weel-kept garden is than one which is always half neglected and that if we are to derive a maximum benefit from our gardens, it pays to keep them in perfect order.

Liquid Manure for Cabbages.—What Cabbages, Brussels Sprouts and Cauliflowers need is a good start before dry weather. Of course it is well to have the ground made rich. Last summer, however, we tried the experiment of planting them in a rather clayey soil without any manure whatever, and feeding them with liquid manure which was kept in flour barrels near at hand. The variety was the Early Flat Dutch, and they proved the largest and heaviest we have ever raised. The manure was taken fresh from the stable and thrown in the barrels which were kept filled with water, or as nearly so as their tightness would allow.

BREVITIES.

"The buyer needs one hundred eyes, the seller only one."

WE were thinking what our agricultural and horticultural writers would do without the word *judicious*.

ACCORDING to latest reports, Oregon and California will have a larger crop of wheat than has ever before been known there.

FOR the purpose of making the off-year of fruit trees a bearing year—suppose we give the trees a heavy dressing of manure in the fall of the bearing year?

WE have found it necessary this month and last to go over our lawns with the lawn-mower every four days. The interval between cuttings has never been so short before.

FARMER SMITH does not oppose the use of commercial fertilizers, entertaining the belief that a good farm, like a good piece of meat, only requires basting with its own drippings.

PROF. COOK of the Mich. Ag. College advises wheat-growers where the Hessian Fly prevails, either to pasture or mow the infested fields after the eggs are deposited and before they hatch.

ACCORDING to horticultural writers of the present day, there are a great many Kings and Queens among trees, shrubs and plants generally. The fact is they constitute a royal family.

A MAN that will kick a good horse
"Is fit for treasons, stratagem and spoils;
The motions of his soul are dark as Erebus:
Let no such man be trusted."

A FEW evenings ago, we counted fifty men standing outside the gentlemen's cabin on the ferry-boat betwen New York and Jersey City, Twenty-five were smoking. There is a great fascination about smoking. Can any one describe it? Can any one tell just why he loves to smoke?

MR. MEEHAN exhibits at the Paris Exposition capsules, seed-vessels, seeds &c., representing the forestry and horticulture of America. The only other representation of American horticulture will be by the Iowa State Horticultural Society, which will exhibit the models of apples made by it for Col. BRACKETT.

THERE is no greater fallacy, says the Rev. J. FARMER of Nottingham, (Eng.) than that the whiter bread is, the better and more nourishing it is. For the more wheat is refined the more gluton is taken away, and finally scarcely anything but starch is left. It has been discovered that there is a ferment in the bran which aids digestion.

PRESIDENT BERCKMANS—of the Georgia Hort. Society—says that the Alexander Peach ripened with him at Augusta, upon young trees, as early as the 25th of May. Amsden ripens at about the same time and the Beatrice ten days after. He has sent the Alexander by mail to several persons North, and they arrived in fine condition, The Beatrice, though it carries well, is rather too small for shipping. Early Louise and Early Rivers are excellent for home use.

How sweet is learning! Listen to the Rev. Jos. COOK.—"Our conversation had turned upon the new Idealism and I had asked the Professor if he did not think that the plastic nature of the Kantian Antinomies might not be explained by particular reference to the 'Weltgemüthlichkeit' of Tauler, as explicated in his 'Geschichte Zua Elkenntniss des Menschlichseelenfinsterniss.' He did not speak for several hours." We should suppose it would have that effect.

A VALUABLE mixture to keep on hand at this season is one of coal ashes, sulphur and hellebore. The ashes should be very fine. It is best after passing them through the ordinary coal-ash sieve. To one pailful of ashes thus sifted, add a quart each of flour of sulphur and hellebore and mix together. For currant worms, plant lice, cabbage fleas, slugs on pear trees, melon bugs, we found this so effectual last season, that we confidently recommend it to our readers. It is always best to use it in the cool of the morning while the dew is upon the leaf.

MANY people are too apt to conceive that success, eminence in the various walks of life, may be gained at a jump; that it depends upon something else beside thought, study, endeavor. They start out with imperfect ideas of the obstacles before them, and fancy that a little of ingenuity, cleverness, of extra endeavor, will accomplish for them what it has quite failed to accomplish for thousands of others. This comes from the hopefulness, the buoyant aspiration of inexperienced youth. Later, the hard fact presses upon them that all of the real success they have met in life has been due to study, observation—to hard work.

Mr. KING, a Scotch agriculturist, says that the greatest mistake which he has ever seen committed in connection with the employment of lime, is that of mixing it with manure before application. In these days of enlightenment it is almost incredible that such an egregious error as this should be committed, and yet the perpetration of this species of absolutely inexcusable wastry is not so very rare. When farmyard manure, at least after it has been kept for some time, is so treated with lime it is almost entirely destroyed and the value of many other manures, by similar treatment, would be very much lessened. Lime should never be allowed to come in contact with the manure, at all; and if it could be arranged conveniently, those two substances should be applied to the land at different times.

Literary Miscellany.

THE COURTIER AND THE KING.

A COURTIER once made free to bring
A cup, and compliment to his king,
Said he, "Your majesty, behold!
Your nobles' love condensed in gold;
Each blazing jewel is a token,
Of praises they have never spoken,"
"God bless them all," replied the king,'
"And now my sparkling sherris bring;—
I drink" said he, "to the unknown
Who mined this metal for the throne:
The artisan who made it shine,
And graved thereon the royal sign;
The lapidary who could [illegible]
These gems in starry loveliness!
For kings and thrones till kingdoms end
On noble labor must depend."

[*Fletcher Bates in Transcprit.*

THE COUNTRY COUSIN.

"Mamma," said Sophy the next morning, "do let us give a party. We must have one before Maggie leaves; and we had much better have it early, so that she may come in for the return invitations."

"I don't think Maggie cares for parties," observed Mr. Harrison, looking kindly at her over his newspaper; "besides, it is full early yet for quadrille parties."

"Oh, but if we have it at once it will be done with," said Sophy; "and as for Maggie's not caring for parties, you are quite mistaken, for she is as fond of dancing as any of us."

"Yes, dancing, perhaps. Well, as you like," said Mr. Harrison. "But what does mamma say?"

"Oh, I've no objection in the world," replied Mrs. Harrison, who was as fond of gaiety as her daughters; "so get your desk, Sophy, and make out a list of names."

Sophy was soon hard at work, while Mr. Harrison, to escape the discussion as to who should and who should not be invited, took up his hat and walked off to his counting-house.

"Mamma," said Sophy, as she reached the end of a tolerably long list, "let us invite young Hamilton; I thought he seemed particularly anxious to improve our acquaintance yesterday."

"So I thought, Sophy," answered Mrs. Harrison, sagely nodding her head; "if we can only manage it; but your papa has such odd notions. However, we must see what can be done."

But there was no need for Mrs. Harrison's diplomacy, as Mr. Hamilton found an excuse for calling the next day, and made himself so agreeable to the master of the house that he readily acquiesced in the proposed invitation.

CHAPTER II.

DURING the time that intervened before the ball little else was talked about, and Maggie grew thoroughly tired of the subject; but she had yet to learn how much there is of practical discomfort in a large party at the house of pretentious people. The preceding day was a scene of the wildest confusion. Beds were taken down and carpets taken up, that supper might be laid in one room and quadrilles danced in another. The study was turned into a coffee-room, and the dining-room into a card-room; so that poor Harrison fairly took flight, and was seen no more till evening, while the boys revelled in the commotion, and took their meals how and when they could, securing divers forbidden dainties in the scuffle. Maggie sought refuge in her own chamber, but she soon found that that was required for a cloak-room; so she put on her hat and went for a long country walk, in which she contrived to lose herself, and only reached home in time for a cold, comfortless, late dinner.

In the morning matters grew worse, and the racket only subsided as the hour approached for the arrival of the visitors. By nine o'clock the rooms were full,—that is, about fifty people were crammed into a space scarcely large enough for half that number, so that flirting was carried on upon the stairs, and love-speeches whispered on the landing. However, the evening passed off well, and was, what Harriet called, "a decided success." But the aspect of the house the next morning was so utterly forlorn and desolate, such a chaos of rout seats and drooping garlands, such a litter of torn finery and champagne corks, such a medley of chicken bones and dirty platters, that Mr. Harrison, who was a sworn friend to order and regularity, might well be heard to exclaim that he was glad it was over.

"And you really like all this gaiety and dissipation, Miss Cameron?" said Claude Hamilton one evening.

"I liked it very much indeed at first," replied Maggie; "but I am beginning to get rather tired of it now, I must confess, and we live so very quietly at home."

"And pray how do you employ your time at home, Miss Cameron, if I may be allowed to ask the question?"

"Oh, I am never at a loss," she replied. "Mamma likes me to keep up my accomplishments; so I practise every day, and draw a good deal; then we have always plenty of books, and generally we play at chess in the winter evenings; so that, with plain sewing and fancy-work, the days often pass too quickly."

"In my day," said Mr. Harrison, "girls learnt housekeeping; and I have heard my mother say that she could make a pudding and knit a stocking before she was sixteen."

"And I can make a pudding, too, uncle," laughed Maggie, "and do, often, when Martha is busy."

"What's that about puddings?" asked Sophy, sailing into the room in full evening costume. "Oh, Mr. Hamilton, I did not know you were here. Are you going to the Stephens' to-night?"

"No, I really could not manage it," he replied. "Three invitations for one evening fairly scared me, so I declined them all, and just called in here on my way home." It was astonishing how often Mr. Hamilton had latterly called on his way home.

"Oh, how very shabby of you!" exclaimed Sophy, with her sweetest smile. "I shall tell Mrs. Stephens how very badly you behave." But the young lady's raillery only elicited an exaggerated expression of despair at his inability to join her party, and an offer to escort her to the cab, in which the others were already seated.

"Mamma," exclaimed Sophy, eagerly, as the cab drove off, "did you know Mr. Hamilton was in the drawing-room?"

"I did," said Fanny; "but as I knew he did not come to see me, I forgot all about it."

"It was very provoking, I must say, and you might have told me, Fanny," said Sophy, very much put out.

"I did not know he was there," said Mrs. Hamilton; "but, after all, it does not matter. Maggie is only a child, and you need not fear, Sophy, dear." But Sophy was not so easily consoled, and a cloud obscured her fair brow, which was only removed by two waltzes and a galliopade, aided by the fervent devotion of a gallant captain of Dragoons.

"And you really can make a pudding?" said Mr. Hamilton, as he drew his chair rather unnecessarily near the little table where Maggie was at work.

"I really can," answered Maggie. "But what is there so very surprising in that?"

"Nay, I think it is very surprising," he said; "and I question very much if you could find a dozen young ladies of a certain class in all this great town of Winterbury who could say as much. And there's another mystery to be solved. How is it you did not go to the Stephens' this evening?"

"Because she volunteered to stay at home and amuse her old uncle," said Mr. Harrison, laying his hand, caressingly, on her glossy hair.

"But it was no sacrifice, uncle," said Maggie, "for I did not want to go. I began quite to long for a quiet evening at home. You play chess, Mr. Hamilton? Ah, then you and uncle can have a grand battle, and I will sit by and watch the game." But Mr. Harrison declared he had not finished his paper, and told the young people to try their skill till he was ready.

The game, however, progressed but slowly, and the supper tray came in before it was half over; and after that there was another hour of pleasant animated chat; so that when Mr. Hamilton at last took his leave, he felt quite convinced he had passed a far pleasanter evening than if he had gone to a dozen balls,

"And what sort of an evening did you have?" asked Maggie, as the girls dawdled over a late breakfast next morning.

"Pretty well," said Sophy, languidly; "but I think I ought rather to ask you that. Pray, how long did he stay?"—the "he," of course, referring to Mr. Hamilton.

"Oh, he stayed to supper, and it was nearly eleven o'clock when he left," replied Maggie.

"How provoking!" exclaimed Sophy pettishly; "and what in the world could you find to talk about all the time?"

"Oh, plenty of things," replied Maggie. "I think he was rather curious to know how sober damsels like me pass their time in the country; so I gave him a slight sketch of my occupations,—very much to his amusement, no doubt."

"And did you tell him you made the beds and hemmed the table-cloths?" inquired Harriet, rather spitefully.

"No, though I might have done so," said Maggie, quietly; "for I do both sometimes. And as it was, I only owned to being vulgar enough to know how to make a pudding."

"Really, Maggie," retorted Fanny. "I begin to suspect you are a very deep little girl."

"A very silly one," interrupted Sophy, hastily. "What would he take you for? I consider pudding-making about on a par with dish-washing, and certainly no lady would wish to do either."

"Then I suppose I am no lady," said Maggie, "for I must say I see no reason why a lady should not do both, if necessity required it; and I know dear mamma thinks no girl's education is complete unless she understands housekeeping; and I am sure work is no disgrace to any one. But I beg pardon for speaking so warmly."

"Oh, there is no need," said Sophy, rather coldly; "it is not of the slightest consequence, I assure you."

While this little domestic scene was going on at the Harrisons', one somewhat similar took place between Mrs. Hamilton and her son. They had breakfasted early, as usual, and were seated on either side of a noble fire, burning in a grate of polished steel. She was a lady who might be between fifty and sixty, though her eyes were still bright, her cheek still smooth, and her figure queenly in its proportions and bearing.

"And who are these Harrisons?" she inquired, when her son had told her where he had spent the previous evening.

"He belongs to the firm of Greatwich, Harrison, & Pardoe," he replied,—"a respectable, well-to-do concern, and old Greatwich is as rich as a Jew; so is Pardoe; but they are bachelors, and the Harrisons are a large family,"

"Grown up?" inquired Mrs. Hamilton.

"Grown up," was the reply. "At least, the girls are; the boys are younger, mere schoolboys, in fact."

There was a pause, during which Mrs. Hamilton gazed thoughtfully into the fire. At last her son broke the silence; rather hesitatingly it seemed.

"There is a young girl, a cousin, I believe, staying with them at present."

"Yes?" said Mrs. Hamilton, inquiringly, as her son made another stop.

"She only came for the winter," continued Claude, in his turn gazing into the glowing embers; "and she will leave early in the spring, unless—unless I can persuade her to stay."

"Claude!" exclaimed his mother. It was only one word, but there was a world of significance in the tone, and he drew himself up rather proudly, and met her steady look with unflinching eyes.

"My dear mother," he exclaimed, "why do you look at me like that? Have you not, for the last three or four years at least, been telling me that I ought to marry, and now that I am really thinking about it you look as if I had broached some outrageous and unheard-of idea."

"Because you have taken me so completely by surprise," said his mother. "I have never seen—never heard of this young lady before; but if she is one really calculated to make you happy, depend upon it you shall meet with no obstacles from me."

"There's my own dear mother," exclaimed Claude, affectionately kissing her delicate hand; "and do not fear that I shall do anything rashly. I have not yet said a word either to Miss Cameron or her uncle. At present, all I want is that you should know her."

"I see but little chance of that, Claude," said his mother, gravely, "going out so little as I do; and it would not do for you to bring her here."

"No, I see that," said Claude; "and yet it must be managed. There is only one way—suppose you give a party."

"A party!" said Mrs. Hamilton.

"Yes, and invite the Harrisons," he replied. "Don't you think it would do, mother? They would be only too happy to come; and it would seem quite natural, as I have been there so often."

And so it was settled, and the Harrisons were in a high state of excitement and delight, and drove their dressmaker to the verge of desperation in their anxiety to have what Sophy called "killing costumes;" for Claude was an only son, and being distinctly related to a viscount, and on visiting terms with more than one of the "upper ten thousand," was considered by all the Winterbury girls as the grandest match in the neighborhood.

CHAPTER III.

An evening party at Deanley Manor was a different affair to a ball in St. John's Street, Winterbury. Here there was no crowding, no display, no striving after effect, but a certain quiet tone of refinement pervaded the establishment, and seemed to blend together every trifling detail into one harmonious whole. There was no regular ball, but the young people adjourned to the breakfast-room and got up a carpet dance, taking it by turns to play. Mrs. Hamilton was not so much engaged with her company that she could not find time to observe Maggie, and the result of her observation was so favorable that she determined to see more of her.

"My son tells me you are leaving Winterbury in a short time, Miss Cameron," said Mrs Hamilton, when she had by a few adroit questions obtained a considerable insight into Maggie's thoughts and fancies. "If it were not asking too much, I would invite you to spend a week with me before you leave; for I am so very fond of the society of young people, but we should be so very quiet."

"Oh, I do not mind that in the least," said Maggie, with childish eagerness. "I am so fond of the country, and if my aunt has no objection——"

"I will ask her myself," said Mrs. Hamilton, "and the carriage shall come for you on Monday morning."

A very few words sufficed to obtain Mrs. Harrison's consent; and Maggie, who was becoming very weary of morning promenades and evening parties, looked forward with delight to the idea of a short sojourn in the country, although Mrs. Hamilton laid great stress on the fact that she should be "quite alone," having made a special proviso that her son should go on a visit to some friends at a distance, and not return until she recalled him. The Harrison girls were quite taken "aback," as Fanny elegantly expressed it, by Maggie's unexpected good fortune.

"Though after all," said Sophy, "it will be nothing so very delightful if you are to be shut up with an old woman all day long, and her son away, too. Oh Maggie, she took care of that, depend upon it; and she only wants you to stop a gap; so it is not so very flattering."

"No, indeed," said Harriet, contemptuously; "but I hear she is a regular old-fashioned goody, who approves of young ladies making themselves scullions and kitchen maids; so I dare say you will get on very well together."

"Well, at any rate you need be under no trouble about dress," put in Fanny; "you can go as shabby as you please, now the young laird's away; though, to be sure, there may be a few callers after the party. However, I prophesy you will be glad enough to come back into the world again."

Maggie wisely held her peace, and gradually the scoffs and jeers died away; yet it was with unmixed feelings of pleasure that she saw the carriage drive up that was to convey her to Deanley. She found her hostess waiting to receive her with a truly warm and cordial greeting. Mrs. Hamilton was one of those rare beings who improve upon acquaintance. The slight reserve that characterized her manner with strangers wore off as she was better known, and she became warm, and even, affectionate, in her bearing towards those to whom she took a liking, as she soon did to her young visitor.

"Do you know," she said, one evening, as they sat by the library fire, "I think I took a sort of fancy to you because your name is Margaret."

"How did you know it was?" asked Maggie. "Oh, I suppose you heard my aunt call me so?"

"No, it was before then—it was before I had even seen you," replied Mrs. Hamilton. "Claude told me."

Mrs. Hamilton glanced at Maggie as she said this, but the quiet face was perfectly calm and unmoved. She had evidently never thought of Claude as a lover.

"Did he? I wonder he should think of it,' said Maggie. "Then you like the name of Margaret?"

"I love it as I love no other," replied Mrs. Hamilton; "it was the name of my dear sister."

"Then do call me so," said Maggie, eagerly. "It seems so formal to be called Miss Cameron."

"Perhaps I may, some day," said Mrs. Hamilton, with a smile.

That night a rather long letter was dispatched to Claude, and it contained these words:—"I am not disappointed in her; and that, you know, is much for me to say on so short an acquaintance. Give me a little more time, and I shall be able to speak more decisively."

The week for which Maggie had been invited passed away far too quickly, for the pleasant morning rambles when the weather permitted, and afternoon drives, with the cosy fireside evenings, were inexpressibly charming to a girl of Maggie's stamp. There was always some new book to discuss, or some village news to talk over, and occasionally more serious subjects would arise; and all tended to convince Mrs. Hamilton that Maggie was a girl of no common mind.

One afternoon, when the weather had changed and the thickly-falling snow made their usual drive impossible, Mrs. Hamilton had been showing Maggie some of the art treasures, of which she had a large collection.

"How nice it must be to be rich!" exclaimed Maggie, as the last antique gem was replaced in its richly carved Indian cabinet.

"Never covet riches," said Mrs. Hamilton, gravely; "my happiest days were spent in comparative poverty." Then after a pause she asked, "Would you like me to tell you something of my past life? It is just the evening for a story."

Maggie assented with delight, and seating herself on a low ottoman, drew a little nearer to her friend and prepared to listen.

"I will pass over my early days," said Mrs. Hamilton, "for there was nothing remarkable either in my education, position or prospects. My father was the younger son of a noble house it is true, but not a rich one, and moreover, he had irretrievably offended his friends by marrying a singularly beautiful and amiable girl of gentle descent but small fortune, in preference to one of immense wealth, plain person and unamiable disposition However, he never repented his choice. We were a large family, but all died young excepting my dear sister Margaret and myself. In her seventeenth year she too passed away, and I was left alone to comfort my almost inconsolable parents. Two years after her death I became acquainted with my late dear husband, and in another twelve months we were married.

"Now came my time of trial, for which, I am sorry to say, I was but ill-prepared. My life hitherto had been easy and pleasant, for my parents, though not rich, were comparatively affluent, and I had never known the virtue of self-denial. My husband was a barrister, well born and well connected, but of very small independant resources, and briefs did not come in so quickly as we had anticipated. The consequence was that our expenses soon exceed our means, and my husband told me this one day when I had been proposing to give a dinner-party

"'My dear Carolina,' said he, "I am afraid we are not justified in incurring any additional expenses. You know how small my income is, and my professional gains do not keep pace with our requirement. I am very much afraid we shall have to retrench."

"'Retrench!' I exclaimed, in absolute dismay for the word seemed significant of nothing short of ruin and disaster.

"'It will be nothing very dreadful darling,' he said, smiling at my tone of horror. 'I thought perhaps we might keep fewer servants, or, at least, put down the carriage."

"'Oh, no, not that!' I exclaimed. "Surely, Edward, it will not need that? We will give no more dinner-parties, and then we need not go to any. The children—for by this time we had three—will be a sufficient excuse for giving up visiting.'

"'I fear that will make but little difference, he replied; 'however, we can try,"

"We did try, and the experiment cost us dear, for in the end we were obliged to diminish our establishment far more than my husband had proposed, and in less than another year we were living in a small house with only two female servants and a gardener, who also waited at table.

"I may as well own at once that I had at that time a good deal of false pride, and at first I made myself thoroughly miserable, and every ring at the bell sent me into a tremor lest our maid-of-all-work should not be presentable, or the man be surprised in his working clothes; and when I went out I fancied my fashionable friends looked coldly on me because my dress was less costly or my bonnet less stylish than usual. Yes, you may well smile, child, and I hope you are untainted by any such absurdities. There was another thing, too that troubled me. My husband liked a good dinner, and I soon found that without some amount of personal superintendence that was absolutely unattainable. I was silly enough to think kitchen matters quite beneath the notice of any lady, and it cost my foolish pride many a bitter pang when I had not only to overlook but even prepare with my own hands the soup or the pudding that I knew my husband had particularly fancied. I am glad you can make a pudding, my dear."

Maggie looked up with a blush and a smile, and Mrs. Hamilton went on.

"Yet it was very sweet to be thanked and praised for my efforts,—so sweet, that in time I grew more than reconciled to my labor of love; and I learned to dread more than anything the luxurious self-indulgence which leads so many wives in the middle class to pass their days in utter idleness, lounging on a sofa and reading novels, while their children are left to menials, and their husbands to the uncheered monotony of a weary, wearing toil.

"Time passed on, and gradually our affairs im-

proved; so that, as is often the case, when once the turn came our tide of prosperity rose high and rapidly, and in a very few years' time our circumstances justified us in resuming and even exceeding our early style of living. Since then my life has been a prosperous and happy one, shadowed only by the one great sorrow of my life, which left me a widow, and, but for Claude, childless. But of this I cannot bear to speak."

The last sentence Mrs. Hamilton spoke so sadly that Maggie's eyes filled with tears, and for the first time Mrs. Hamilton drew her towards her and pressed a kiss upon her cheek.

"And now run away and dress," said Mrs. Hamilton, "for the second bell has rung, and we shall be late."

"I shall not be long," said Maggie; "and thank you, dear Mrs. Hamilton, so very, very much."

The next day was the last of Maggie's week, but, to her great delight, Mrs. Hamilton asked her to prolong her stay, saying, "I expect Claude home to-morrow."

"Oh do you?" exclaimed Maggie, but with a look and tone almost of disappointment.

"Why, my dear child," said Mrs. Hamilton, laughing, "how grave you look! Most girls would receive the announcement in a very different manner."

"Oh, I beg your pardon," stammered poor Maggie; "I did not mean—that is, I was only thinking that we shall have no more such nice quiet evenings."

But Maggie was mistaken, and soon learned to think the evenings quite as nice, or more so, than they were before Claude came; and her cheek began to flush, and her heart to beat at the sound of his voice or footstep. And one day when they returned from a long walk together there was something so new, so happy in her whole look and manner, that Mrs. Hamilton, taking both her hands in hers and looking earnestly in her blushing face, said softly, "I must call you Margaret now, I think."

Maggie's engagement was duly announced to the Harrisons, and received with very mixed feelings. Sophy was inclined to resent it; Harriet professed extreme disgust at what she called "Maggie's dreadful slyness;" and Fanny declared all that vexed her was that she had not entered the lists herself. Mrs. Harrison, however, was delighted at the prospect of being so nearly connected with "the Hamiltons of Deanley Manor," and immediately began to plan various schemes of aggrandizement for her daughters, none of which took effect; and long after Maggie had been a happy wife and mother, the Harrison girls, who had been engaged a dozen times, at least, were still unwooed, unwed,—a circumstance that did not improve either their looks or temper. Eventually, however, Sophy, growing in despair at her faded cheeks and scanty ringlets, which even bloom powder and hair-restorers failed to renovate, accepted an ancient lover, who made her an offer under the combined effects of unlimited flattery and an extra glass of brandy-and-water. Harriet took advantage of a weak moment to entrap an unsuspecting curate, and Fanny turned devotee, in the forlorn hope of ensnaring a popular preacher. Still, however, as Sophy sometimes owns, when in a desponding mood, it is a most aggravating thing to be outdone by a simple Country Cousin.

CORA.

CHAPTER XVI.

Three Years Later.

"Bend your head a little more forward, Cora, and draw the child more within your arm. Yes; that is better. I am afraid I tire you, dear wife."

"What nonsense, Alan; you know I delight in sitting for you."

And Cora glanced over at her husband's tall figure and bearded face, with a bright look of loving pride in her lustrous eyes.

They were in Sir Alan's studio, a large and lofty room in the handsome mansion to which they had removed from The Bungalow about a year after their marriage—Sir Alan finding it better for his interests that he should be in the metropolis itself, at any rate, during the greater part of the year. His name was not unknown in the art world now; his love for Cora, and his happy married life, had not damped his energies or his interest in the art he loved, and he had won fame, and was winning fortune, with his chisel, and with his strong, true right hand. The bust was at his foot now; he had modelled a bust of some great Court beauty which had created a sensation, and Sir Alan awoke one morning to find himself "famous." A royal foreigner, an enthusiast in sculpture, had had his statue chiselled by the young baronet; then a great national piece of work had been offered to him and accepted; so that Cora's husband was a great man now; and as his father had been famous in his career, so did the son promise to make his name glorious by his art.

Much as Cora had loved her husband before their marriage, greatly as his many noble qualities and high character had made her reverence and esteem him, she loved him doubly now, and no married life could have been happier, more full of domestic bliss, than Sir Alan and Lady Vincent's. They had been married nearly three years, and little Harold Sinclair Vincent was almost two years old, but Cora's beauty seemed only heightened by passing time. At twenty-four she was as lovely as at twenty; and people said that the quaint artistic dress, which Sir Alan liked her to wear, though it would have tried most women, was simply the most becoming costume in the world to her.

"Lady Vincent always looks as if she had stepped out of an old picture," people said: and while her own drawing-rooms were always well filled with great people and celebrities, Cora was a welcome and sought-after guest in the *salons* of the great upper ten; and "Who is that beautiful creature in that quaint Vandyke costume?" was a frequent question at fashionable *reunions*.

It seemed to Cora sometimes as if her life was too happy and too blest, as if some day it must be paid for by some great unhappiness; but Sir Alan laughed at the idea, and whenever she mentioned it, teased her out of the "morbid creed," as he called it.

His wife was Sir Alan's most frequent and favorite model, and more than once he had modelled her rare loveliness under various forms. When we find them again, on a fair spring morning, when even in "smoky London" one might obtain a glimpse of blue sky, Cora was sitting to him, with her boy, and Sir Alan was busily at work on a group representing Charity assisting little children; and the lovely face of his wife showed that, as she said, she "delighted to sit for him."

"That's a dutiful wife," said Sir Alan, smiling over at her. "Don't look so bewitching though, love, or I shall come and spoil the group by kissing my 'Charity.'"

"I wish you would," laughed Lady Vincent, "I shall begin to charge so many kisses an hour. I think," she added, laughingly; "but I must be paid in advance. I think some one knocked at the door, Alan."

"Come in," said the sculptor-baronet, turning a little impatiently.

The door without was opened, and the heavy curtain concealing the entrance into the studio drawn aside. A tall, strongly-built man, evidently an indoor servant out of livery, appeared, with a note lying on a silver salver.

"What is it Marks?" said Sir Alan.

"A note for my lady, Sir Alan. There is no answer."

"Very well," and Sir Alan took the note, and with a bow the servant disappeared.

"How I dislike that man," said Cora, a little impatiently.

"Why?" asked Sir Alan, as he brought the note to her.

"Read it, Alan, please. I might disturb the boy." For Cora held the child in her arms, and he was sleeping.

Sir Alan opened the note: it was elaborately scented, and bore a wonderful monogram on heavily cream-laid note-paper.

"DEAR LADY CORA,—

"Will you and Sir Alan think me very troublesome if I make a morning call in about an hour after you receive this? An old friend having returned from abroad, after a long absence, wishes to see Sir Alan's great work before it goes to St. Petersburg, and I want a glimpse of the bust of the Princesse de Pincetaille. We will try and not take up too much of Sir Alan's time; but, you know, he must suffer the penalty of fame.

"Sincerely yours,

HELEN ST. MAUR."

Sir Alan did not look enchanted at her ladyship's pretty billet, and made no comment upon it, except:

"Good-bye to our quiet morning, Cora," as he returned to his work.

"By-the-bye, my child," he said, in a few moments, "why don't you like Marks? He seems to me the perfection of a servant, and is evidently rather a superior person."

"I detest superior people," exclaimed Cora; "but I always have the feeling with him that we have met before. I don't think he is honest."

"Are you afraid he will steal the spoons, Lady Vincent?" asked Sir Alan, merrily.

"No, Alan, I don't doubt his honesty in that way. I mean, I don't think he is true."

"Foolish girl: he seems to me particularly plain and aboveboard."

"Well, dear, he is your especial property, you know," she answered; "but his eyes always seem to be following one about whenever he is in the room."

"Perhaps he is an admirer of the beautiful, wife."

"Don't be absurd, Alan," said his wife, petulantly, pouting her pretty lips.

"Am I absurd, sweetheart? Most men are where pretty women are concerned."

There was a long silence, broken only by Sir Alan's chisel, until Lady Vincent began, a little plaintively:

"We never have a quiet morning, Alan."

"The penalty of fame, my child."

"I shall begin to wish you were not so famous, Alan," she replied, looking over at him with a proud light in her eyes.

At this moment the drapery of the entrance was drawn quickly aside, and Marks announced:

"The Countess of St. Maur; Viscount Almane."

Sir Alan put down his chisel, and turned to receive his guests with the quiet high-bred ease and courtesy which distinguished him.

Cora sat still, almost unconsciously retaining the attitude in which she had been sitting for her husband; the color receded slowly from her beautiful face, even her lips paled in the surprise of the moment. Marks, as he dropped the curtain, noted the fair face, and he saw that there passed over it an expression of horror and fear.

"I must apologise, Sir Alan," began the Countess, as she came in her rich robes of velvet and fur, with her proud beauty and haughty bearing; "but, as I said, you must bear the penalty of fame. Allow me to present to you Lord Almane.'

Sir Alan bowed, as he relinquished the Countess's little gloved hand, and turned to the Viscount who uttered some facile compliment with his usual easy grace; and the sculptor's artist eye was struck at once by the rare beauty of his face, bronzed as it was by the hot sun of eastern lands, the haughty grace of the proudly-set head, the languid grace of movement and manner.

"Oh, Lady Cora," went on Lady Helen's gay voice, "are you doing 'model?' Nay, don't stir." Then, in a slightly lowered voice, she went on: "I have brought an old friend to see you."

Cora had risen, but her face was almost as colorless as the long, loose, white Grecian robe she wore.

"You find me in strange attire," she said, quietly. "Pray excuse it, Lady St. Maur."

"Nay, it is most becoming," laughed the Countess. "I wish the Earl had artistic tastes, and would allow me to dress in that fashion. But you look pale, Lady Cora. Are you not well?"

"I am a little tired," she answered, quietly, as she went forward, still holding the boy, and met Lord Almane.

"Lady Vincent and I are old acquaintances—I might almost say friends, Sir Alan," said the Viscount, as he took Cora's hand in his, and looked down at her with a melancholy sadness in his dark eyes.

Sir Alan expressed his surprise, and glanced rather inquiringly at Cora.

"We have not met for some years," went on Lord Almane in a sad, sweet voice which touched Cora like the echo of some old, well-remembered song; "but you are little changed. Is this your son?"

He stooped over the child for a moment, and Lady St. Maur claimed Sir Alan's attention. He went towards her, and Cora stood with Lord Almane bending over her son, trembling with some undefined fear.

"A beautiful child," went on the Viscount, quietly, as the boy awoke, and looked up at him with big, surprised gray eyes. "He has your eyes, Lady Cora."

He stooped over him again, touched his brow lightly with his lips, gave her a lingering glance of sadness and reproach, turning away with a long, low sigh.

A minute or two, during which Cora seemed occupied with the child, enabled her to regain her composure, and to overcome the emotion which the sudden meeting had excited; but the flood of recollections which Lord Almane's presence brought back to her had almost overcome her, and she still trembled.

"Will you excuse me for a few moments, Lady Helen?" she said. "I want to give Harold up to his nurse."

"Harold!" exclaimed Lord Almane, softly. "Your brother's name? How well I remember him," he added, with a sigh.

"Are you cold, Cora?" said Sir Alan, taking the boy from her into his strong arms. "Why, my dear, you are trembling; run away and get on some warmer garments. I ought not to have kept you so long."

And as the mother and child disappeared he turned to his guests, and during half an hour they were occupied with the studio and art talk.

Both the visitors made themselves most agreeable. Lady Helen, with her great beauty, set herself to charm Sir Alan, leaving Lord Almane free to devote himself to Cora, who soon came back, having changed her dress.

"It seems hardly possible that it is nearly five years since we met," said the Viscount, as they paused before the French princess' bust, and seemed to comment on its beauty. "I heard of your marriage when I was at Smyrna."

And again the low, regretful sigh.

"I lost sight of you completely," he went on, "after your visit to Mrs. Colsion. You remember it? I could bear my chains no longer then; but when I was free I found that you——pardon me, I know old associations are disagreeable, Lady Cora. May I tell you how much I rejoice in your happiness now, although——"

He hesitated; but Cora said nothing, and in a moment he went on:

"You believe me, do you not?" he said, in the musical voice of bygone days. "You know that your happiness, your welfare, must always be inexpressibly dear to me, for the sake of 'Auld lang syne.'"

"Luncheon is ready, my lady."

Whether it was that both Cora and her companion had been too absorbed to hear steps coming along the gallery, or that Marks had been even more noiseless than usual, certain it is that both started when the voice sounded close beside them; and Sir Alan, who was standing at the opposite side, listening to the Countess's gay chatter, noticed Cora's quick movement.

"Are you not well, my dearest?" he whispered, as she passed him on their way to the dining-room. "You look so pale."

"I am quite well, Alan."

But her husband noticed anxiously that she ate nothing at luncheon, and grew a little alarmed; although she was gay as usual and chatted with her guests. When they had gone he came back to the dining-room.

Cora was standing at the window, watching Lady Helen's barouche drive away. He went to her side, and put his arm round her. For once Cora did not move, and made no answering motion towards him.

"I am afraid I tired you this morning, love," he said, gently; "you have been looking so pale."

"I am not tired, Alan," she answered, quietly.

"I did not know you knew Lord Almane," he went on, after a momentary pause. Was it imagination, or did the little hand lying in his give a start, as if something hurt it?

"Harold knew him," she answered in a low tone.

"He is a handsome man," said Sir Alan, carelessly. "What are you going to do this afternoon Cora?"

"I don't know. Will you drive with me, Alan?"

"I would like it, dear; but I have an engagement."

"Then I will go and lie down. My head aches."

"And your hand is very hot, dear child. I thought you were not well."

"One may have a headache without being ill," she said, pettishly.

"You are certainly cross, pet, and you are not so when you are well," said her husband, smiling. "Go and have a nap, and be your own bright self by dinner-time."

She moved towards the door; then came back, and lifted her face to his with an expression of sweet contrition.

"Forgive me, Alan," she said, softly; "I was very cross."

He bent, and kissed her fondly. Cora went away, and, in the solitude of her own room, threw herself on a couch, and thought over the visit of the morning.

It was not that Lord Almane's sudden appearance had awakened any of the old feeling towards him; it was not that even a spark of that love lingered in her heart.

Cora was loyal to her heart's core to her husband; but the sight of the Viscount reminded her of a passage in her girlhood of which she felt Sir Alan ought to have been apprised, and of which she had, fearing to lose his love and knowing his jealous nature, purposely kept him in ignorance. If by any chance it should come to his knowledge now, he might imagine that there was more in it than there had been, and it might sow dissension in their happy home. Cora felt that she must avoid Lord Almane in every way—that, if possible, she must keep from any chance meeting with him; but how do so without arousing Sir Alan's suspicions? The Viscount's looks and words had been significant, and she trembled at the thought that her own emotion might have been noticed. Cora, with her keen impulses and sensitive nature, was quick to show what she felt, and had difficulty in suppressing outward signs of agitation; but she determined to school herself in order to meet Lord Almane as any chance acquaintance. But it gave her a pang of sharp pain when she recollected that she had a secret from her husband—from the honorable, noble-minded gentleman who had loved her so passionately, and who had filled her life so full of happiness and peace—the father of her child.

Some day, she told herself, she would find courage and tell him all—some day. But would he forgive her? Was it likely, for such a long deception?

Poor Cora bowed her head upon the cushions as she thought of his anger. Until now she had never felt her sin against him; he had trusted her so entirely she ought to have told him. And as she thought, her tears fell fast upon her clasped hands, and she mourned over the first shadow which had fallen upon her life since her marriage.

CHAPTER XVII.

A Constant Visitor.—A Gathering Tempest.

"And so, *M. le Vicomte*, you really think of forcing yourself into that domestic paradise, and spoiling the pretty *tableau* of such a devoted husband and wife?"

And Lady St. Maur lifted her dark eyes to Lord Almane's face with a curious expression—half-mocking, half-resentful.

They were sitting in her boudoir, an exquisite room, hung with pale blue satin and old lace, where the beautiful Countess received her intimate friends, and those favored individuals with whom she condescended to flirt.

"Why should I spoil such a pretty *tableau*, my dear Countess?" answered the Viscount, in low, languid tones, without lifting his eyes from a dainty Sevres vase he was examining. "It would be very awkward of me to do so. For example, my dear friend," he added, lightly, "I am a constant visitor here, and yet I have not, I hope, interfered in any way with the picture of domestic bliss which you and Lord St. Maur represent."

The Countess laughed, but colored. The Earl of St. Maur being as devoted a politician as his wife was an accomplished coquette, and neither caring sufficiently for the other to interfere with their vocations.

"But it seems that Sir Alan is as jealous as a tiger," she went on. "He looked furious last night at Lord Muncaster's because you took Lady Cora into dinner, and were so devoted."

"Did he?" said Lord Almane, a flash of triumph crossing his handsome face. "That would make it still more exciting. No woman is so easy to win as the wife of a jealous husband."

"And why, pray?" said the beauty, glancing at her little jeweled hands, and noticing the effect of her dainty lace cuffs.

"Because if he is idiotic enough to scold her or sulk, it will naturally make her more anxious for some one who will sympathise with her and not sulk."

So saying Lord Almane rose slowly from his cushioned *fauteuil*, and replaced the Sevres vase on a little buhl table beside him.

"That vase is an acquisition, Helen: I congratulate you. Shall I see you at the opera to-night?"

"Yes, I am going in for an hour before the Countess Steinmarek's ball. Come to my box, Stanley."—To be continued.

RECENT LITERATURE.

Memoir of Wm. Francis Bartlett—By FRANCIS WINTHROP PALFREY. Boston: Houghton, Osgood & Co. Price $1.25.

THE life of General Bartlett strikingly exemplifies that accident may develop elements of particular greatness in a man whose destiny otherwise would be comparative obscurity. Born and reared to the life and duties of a civilian, those latent qualities which achieved for him so exceptionally brilliant a career were called into action by the Civil War. At the age of twenty-two General Bartlett, having risen from the ranks, found himself in command of a regiment in active service, and that it was said to be the most thoroughly drilled and best disciplined of all the volunteer regiments in the service, was a marked tribute to the indomitable will, spirit and soldierly attributes which characterized the young commander. At the age of twenty-three he was promoted to the rank of Brigadier for "gallant and meritorious conduct," and at twenty-five a brevet Major Generalship was tendered him.

The book under notice is a compilation of letters to and from General Bartlett and extracts from his faithfully kept diary, descriptive of his career during and after the war up to the time of his death in December 1876. From long and intimate association with the subject, Col. Palfrey is well qualified as his biographer and to supply

whatever is wanting to make the record complete and full. There is always something fascinating in the perilous adventures of a brave man and most of General Bartlett's experiences, his many successive wounds—he never went into battle but once without being disabled—his tenacity and devotion in persistently returning to his command, his capture at Petersburg, his patient endurance in prison of the sufferings consequent on the criminal delay in effecting his exchange, are all described in his letters and his diary with the pathetic simplicity of an intrepid soldier conscious of doing no more than his plain duty as he sees it.

As in war he "imitated the actions of the tiger" so in peace was he characterized by that "modest stillness and humility" which so becomes the true soldier. When the war closed he was a scarred and crippled veteran of twenty-five, and his record had made him the most conspicuous soldier of his State. His position entailed upon him during the latter years of his life prominent duties in many of the military celebrations and it was then that he developed a talent for oratory never before suspected, and his eloquence will linger long in the hearts of those whose privilege it was to hear his words. "How many are truer and better men for your influence," said one among the last letters he received "you may never know. Your life is already in many another man."

With singularly clear judgment and absolute integrity and modesty he conducted his affairs at this period. Many civil positions of high honor and responsibility were proffered him but conceiving that each involved some sacrifice of principle or justice on his part he promptly declined them all. The devious and self-serving ways of the politician he could not understand. It is altogether in keeping with the character of the man, that he, among the first after the war, earnestly advocated the most liberal spirit of toleration on both sides as the surest and most consistent means of securing a just and lasting peace; and that when required by his business to reside in Richmond, the scene of his incarceration as prisoner of war, he speedily won by the virtues and graces of his private life the affection and respect of his late adversaries, to such a degree, that when the news came to them of his death, his late residence in Richmond was draped in mourning, and assembled citizens passed resolutions expressive of their sense of bereavement in the death of the venerated and esteemed hero.

Corporal Bruce of the Balaklava Six Hundred. By GEO. B. PERRY. Boston: Loring. Price 50 cts.

This is a thrilling story of the time of the Crimean War, Corporal Bruce being one of the heroes of the Light Brigade, whose charge at Balaklava poets have rendered immortal. It is not all of war, however; the touching friendship of the two old retired veterans,—fathers of the hero and heroine,—whose life-long dream has been the consummation of their mutual devotion in the union of their children, the faithful, tender and self-abnegating love of the heroine, the absorbing passion, ardor and courage of the hero as well as his faults and weaknesses and his pathetic sufferings in consequence of them, are all graphically depicted. Without being sensational the story is engrossing and fascinating. The plot is easily and naturally developed, and all the characters are finely delineated.

Canoeing in Kanuckia; or, Haps and Mishaps, Afloat and Ashore. of the Statesman, the Editor, the Artist and the Scribbler. Recorded by the Commodore and the Cook (C. L. NORTON and JNO. HABBERTON). New York: G. P. Putnam & Sons. Price $1.

THE name of Habberton on the title-page of a book is a sure indicator that the reader thereof will find in it no end of entertainment, and this latest addition to the author's family of brain children displays the same characteristics as its elder brothers. Beside heaps of fun and interesting incidents of travel, there is much really valuable information on the subject of canoes—the different models, their merits and demerits—and on the management of this now popular style of craft.

The World's Fair, Philadelphia, 1876. By FRANCIS A. WALKER, Chief of the Bureau of Awards. New York: A. S. Barnes & Co. Price 75 cts.

This is a series of articles originally published in the International Review. The author, as Chief of the Bureau of Awards, is qualified to speak with authority on every phase of the subject, and the book will be found a timely and satisfactory *resume* of the details of the American exhibition, by those who have in contemplation a visit to Paris during the exposition just opened there. To the general reader it will commend itself as an entertaining account of the administration of the Fair at Philadelphia, and of the display of the various exhibits.

Drew's Window Garden. Published by Geo. W. Park, Mt. Vernon, O. Price 25 cts.

W. C. L. DREW (floricultural correspondent of the RURAL NEW-YORKER) has written a comprehensive treatise on the culture of house-plants, complete in seventeen chapters. It is a plain, practical work, and those who are interested in window gardening will find it a useful little manual.

J. B. LIPPINCOTT & Co. of Philadelphia will shortly publish a new novel, by the author of "Odd Trump," entitled "The Clifton Picture." Also, the Life of Alex. H. Stephens, written with the approval of Mr. Stevens by Prof. R. M. Johnston and Wm. Hand Browne, which will be large, complete and carefully prepared.

The same house have just issued Petrarch, by Mrs. Oliphant; "A Sketch-Book of the American Episcopate," Rev. Dr. H. G. Batterson; "A Study of Milton's Paradise Lost," by Jno. A. Hume; and "Earthly Suffering and Heavenly Glory," by the Rev. Henry A. Boardman.

BRIC-A-BRAC.

He held her in his strong right arm,
Close to his throbbing side;
They heard the music of the sea,
The moaning of the tide

Long years have passed, and often now,
The neighbors, either side—
Hear, when the family jars break out,
The moaning of the tied. [*Hawkeye.*

GLASS slippers have been produced by the cunning artificers of Vienna. The slippers are actually woven in fine flexible threads of glass. The novelty is quite as much in the effect as in the material. Not only do lines of colored light, in different hues, and distinctly definable, traverse the body of the slipper, but, with the motion of the foot of the wearer, these hues so blend and intermingle as to produce a magical and beautiful effect, particularly when seen by gaslight.

HEAR the bell-punch with its bells,—
O, what a slew of revenue their melody foretells!
How they jingle, jingle, jingle, in the glaring air of noon,
While the breakers, twain and single,
By the ingle, mingle, mingle, as he stirs them with a spoon,
With a spoon, spoon, spoon, spoon,
Spoon spoon, spoon, spoon,
With the circumbobulation of the spoon
E. A. P. in the Graphic.

MATRIMONY AMONG ENGLISH PAUPERS.

How one's ideals of the clinging and enduring nature of the marriage compact are shattered by the following: It has been very properly insisted that to forcibly separate old married couples in the workhouse is cruel and unnecessary. But in St. Pancras workhouse, according to a writer in the Daily Telegraph, the old couples do not care to live together. In the course of a graphic account of a visit recently paid to the workhouse he says, in reference to the rooms set apart there for old couples:

In fact, the married rooms are an utter and complete failure. The old ladies, so long as they can see their good men occasionally, apparently do not care to be bored with their perpetual presence, and they infinitely prefer a gossiping life in a dormitory of women. The old men shake hands with their partners at this last stage of their career, and take their pipes and their snuff-boxes off to the rooms where they can chat with male companions. The good wife is, I am ashamed to say, regarded by the St. Pancras pauper as a useful and not an ornamental luxury. She was all very well when she was able to make a dumpling or boil a potato; but now that the boiling and baking, the cleaning and the bed-making, is done by ordinary workhouse routine, I grieve to say these selfish old gentlemen politely take off their hats and bid adieu to the "old woman" at the workhouse door. This is all terribly unsentimental, but is a fact.

A BIBLICAL ALPHABET.

A was a traitor hung by the hair—
II. Samuel, xviii., 9.
B was a folly built high in the air—
Genesis, xi,, 9.
C was a fountain o'er-looking the sea—
I Kings, xviii., 43–45.
D was a muse buried under a tree—
Genesis, xxv., 8.
E was a first-born bad from his youth—
Hebrew, xl., 16,
F was a ruler who trembled at truth—
Acts, xxiv., 25.
G was a messenger sent with good words—
Daniel, ix., 21.
H was a mother loaned to the Lord—
I. Samuel, i. 27—28,
I was a name received of the Lord—
Genesis, xxxii 31—28.
J was a shepherd in Arabian land—
Exodus, iii,, 1.
K was a place near the desert of sand—
Deuteronomy, i., 10
L was a pauper begging his bread—
Luke, xvi., 20—21,
M was an idol, an object of dread—
Leviticus xx.,2—3
N was an architect ages ago—
Genesis, vi., 13—23.
O was a rampart to keep out the foe—
II Chronicles, xvii 2—3.
P was an isle, whence a saint looked above—
Revelations, i., 4—9
Q was a Christian sainted in love—
Romans, xvi., 21.
R was obscure, yet a mother of Kings—
Matthew, i., 5.
S was a Danite, who did wonderful things—
Judges, xiv,, 5—6.
T was a city that had a stronghold—
II. Samuel, xxiv., 7.
U was a country productive of gold—
Jeremiah, x., 8.
V was a queen whom a King set aside—
Esther, i., 10—22.
Z was a place where a man wished to hide—
Genesis, xix., 1.
Read II. Timothy, iii., 15.
[*Buffalo Sunday News.*

THE king of Denmark is an amiable and judicious sovereign. A poor woman, the wife of a laborer, past fifty, observing a few months ago three children, who had fallen through the ice on a lake, rushed into the water, and at the imminent peril of her own life, rescued the children. His Majesty the king decided that this act of bravery should not pass unrowarded. The poor woman was sent up to town from the country; a room was prepared for her in the royal palace, where she stayed a couple of days to see the sights of Copenhagen, and she received from the hands of the king, in the presence of the royal family, the medal and ribbon for civil acts of bravery, being the first woman in Denmark who has received this honor. On one evening the king had secured places for her and her family in the Royal Theatre, where she was the observed of all observers.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

BEAUTIFUL THINGS.

BEAUTIFUL faces are those that wear—
It matters little if dark or fair—
Whole-souled honesty printed there.

Beautiful eyes are those that show,
Like crystal panes where hearth-fires glow,
Beautiful thoughts that burn below.

Beautiful lips are those whose words
Leap from the heart like songs of birds,
Yet whose utterance prudence girds.

Beautiful hands are those that do
Work that is earnest and brave and true,
Moment by moment the long day through.

Beautiful feet are those that go
On kindly ministries to and fro—
Down lowliest ways, if God wills it so.

Beautiful shoulders are those that bear
Ceaseless burdens of homely care
With patient grace and daily prayer

Beautiful lives are those that bless—
Silent rivers of happiness,
Whose hidden fountains but few may guess.
[*Littell's Living Age.*

INFLUENCE OF WOMEN.

IS MRS LUCY WEBB HAYES PRESIDENT OF THE UNITED STATES?—ABSURDITIES OF THE POSITION ILLUSTRATED.

THOSE who propose giving to women absolute civil and political freedom urge as an excuse for not so doing that they already have all the power they need. We are gravely told that "lovely woman" even now does more by her indirect influence than men accomplish directly. We are informed that "the hand that rocks the cradle rules the world," and men at public dinners are prone to grow maudlingly eloquent over "The Ladies, God bless 'em," and "Woman, God's last, best gift to man." By the way what a funny assumption of man's usual position there is even in this last intended compliment—"God's gift to man." Evidently the masculine mind cannot be disabused of the idea that everything, woman included, was made for him. One is also tempted to ask how many of the hands that rock the cradle can command a new dress when they need one?

MRS. DAHLGREN'S POSITION.

Even women are forced to reiterate all this nonsense. For instance in Washington there is a handful of ladies who oppose the woman suffrage movement. They are headed by Mrs. Dahlgren, herself an amusing specimen of the contradictoriness of woman's position, and the uselessness of her "indirect influence." This lady professes not to be "strongminded," yet she is known not after the meek, old-fashioned way as Mrs. Ulric Dahlgren," but her maiden name, "Madeline Vinton Dahlgren," whereas a truly humble wife should have utterly sunk her individuality in her husband's. Again, wishing to obtain money for the Dahlgren guns, the invention of the late Admiral, his widow has appeared before Congressional committees and urged her claims with much eloquence. Yet when women ask for suffrage Mrs. Dahlgren opposes their claim, and prettily prattles of that "moral influence over men" which is all potent "in business affairs." The lady's utterances are sufficiently answered by her own actions. She claims to speak for the masses of "silent women," yet herself loudly pleads for her moneyed interests. She tells other women to be contented with "indirect influence," but herself demands personal recognition.

NECESSITIES OF DIRECT POWER.

If it were not that centuries of subordination have made women blind to their own interests, they would unite in asking with one voice for direct power the necessity of which is constantly demonstrated. Take our school teachers for instance. Of what avail was their "moral influence" against an unjust reduction of their salaries? If those 27,000 women had been 27,000 voters, will not every one admit that their direct political influence would have been far more potent in receiving their protection? Again, look at the "praying bands" of the Western temperance excitement two years ago. They tried faithfully the womanly weapons of tears and prayers. Of what use was this "indirect influence" compared to man's power in legislation? All the persuasions of those women amounted to absolutely nothing, because they had not the direct control of the laws, which alone can strike a blow at the evil of which they complained.

It is so in all ways and in every direction. Womanly protests, womanly entreaties are of no avail to give to women protection in their dearest interests, and men smile sweetly under womanly influence in States where women have no right to their own property, their own earnings, or even their own children.

FEMALE LOBBYISTS.

But we do not pretend to deny that women have in all ages wielded a roundabout influence often pernicious in its effects because of its indirectness. There is no position more dangerous than that of "the power behind the throne," because it is power without responsibility. We have seen women who had been taught all their lives that the only way to rule men was by their charms; using those charms to gain unjust or wicked ends. It has been said that we needed no women in public life at Washington, because of the corrupting influence of women like Mrs. Stanton and Mrs. Livermore acting as Senators or Representatives, or the indirect influence of a painted and bedizened female member of "the third House?" And who is most likely to banish these unhappy specimens of their sex, dignified elderly ladies, or the silly elderly gentlemen who are now so easily befoibled?

A WIFE'S INDIRECT INFLUENCE.

Again, it is always a sad sight to see a woman of real ability and worth trying to accomplish by her "indirect influence" what the law and the usage prevent her from doing directly. In other words, to see the brilliant and talented wife of a mediocre man laboring desperately to help him to power and keep him in place. After all her efforts he must still at the critical moment do the work himself, and thus swift failure is sure to result. However carefully the wife may have coached him at home, it is the man himself who must make the speech or act in the committee, and then the inevitable blunder follows because the mouth-piece has not beside him, the ready-witted brain.

MADAME ROLAND.

To go back nearly a century, the story of Mme. Roland is a striking illustration of this. She it was who stimulated her husband to assume the position he took as a revolutionary leader; she prepared his speeches, but, alas! could not deliver them. History records no more striking picture than that of the brilliant and beautiful wife leaning eagerly forward from the gallery, her fine face a-glow with excitement, while her common-place husband tried to utter the eloquent words she had prepared for him. How much more fitting it would have been if that glorious woman could have stood in the tribune herself, and poured forth the appeals which her genius would have rendered all potent.

Talk of woman's "indirect influence!" What was the result in this case? That because the poor husband had not the grand wife with him he blundered and fell. The result is only the old sad sory! Women must be contented with an indirect place so long as there is power or glory to be won, but when the meed is hardship or suffering then they must bear their burden directly on their own shoulder. So this gifted being, who had never been allowed to utter one word in her own behalf, bore the penalty of an indirect influence by the loss of life itself, and another name was added to the long list of women martyrs to man's most unjust laws, when the fairest head in France fell on the block.

MRS. LOGAN AND MRS. WILLIAMS.

In our own country we have seen in many instances of a woman's laboring a lifetime to bring a husband into power only to have him fail at the critical moment because he stood in the place which she should have properly filled. It is notorious that ex-Senator Logan owed his position to the exertions of his brilliant wife, who succeeded in placing him in the Senate chamber, but who could not keep him there. The new Senator, Williams, of Kentucky, is said to owe his place to similar indirect feminine influence. It remains to be proved where the real strength lies.

MRS. PRESIDENT HAYES.

But a still more striking instance of indirect influence is to be seen in the White House to-day No one can look in the faces of our worthy President and his most excellant wife without seeing where the real strength lies. Evidently from the moment the young Rutherford had sense enough to fall in love with Lucy Webb she has been his guide and controller. To-day she is undoubtedly the real president of the United States, indirectly this has been acklowledged; on all public occasions Mrs. Hayes has been presented and cheered on, being recognized by great audiences as one of the most important members of the Presidential party. Her dictation on the subject of wine has been all powful at State dinners, and the other day, in Philadelphia the honest "sailor men" did not dare to imbibe their very mild form of "grog" until they had asked permission, not of Mr., but of Mrs. Hayes.

No doubt the men of the country have done well in so arrranging their last abortive attempt at an election that its result has been to make Mrs. Hayes President; but as she alas! cannot preside at Cabinet meetings, and as the Secretary of State has unfortunately no "indirect influence" to give him backbone, we have the singularly weak administration which is now afflicting the nation. Next time we suggest that the men elect Mrs. Hayes by direct vote, as she has not said she will not serve a second term.

LILLIE DEVEREUX BLAKE.

THE manager of the Chicago *Daily Evening Post* Oliver A. Willard, Esq., a very capable man, died a few weeks ago; and his place has been filled by his wife, who takes charge of the business department, and his sister, Miss Francis E. Willard, who will control the editorial department. Their card to the public shows that they have a good idea of what a newspaper ought to be and we wish them great success. Miss Willard has had much experience in public life and in helping on the causes which benefit public morality, and brings no unpracticed pen into her new editorial work. To an earlier generation the name of her mother, Mrs. Emma Willard, was very familiar as that of a writer and teacher.

THERE are now seventy-two postmistresses in the United States, one of whom, Miss Nina Hodges, in the Des Moines post-office, is said to have handled and paid out four million dollars.

FOR the first time in Holland, the degree of Doctor of Medicine has been conferred on a lady, Miss Aletta Jacobs, who has announced her intention to practice medicine at Amsterdam.

SEVERAL answers to correspondents asking information about fashions, books, and the complexion have to be omitted this week on acco of want of space.—FAITH RIPLEY.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

THE house-cleaning is over. The last carpet tacked down by busy willing hands, that do these needful tasks for "love of mother;" the curtains in place and our extra help has given her pleasant "*bon jour*," and sought "pastures new" for the exercise of her useful talent. Yet many things must be attended to before the house is really in summer array. Straw matting must be washed with salt-and-water to prevent turning yellow, and unused tins that are not regularly polished, come in for their cleaning now, with fine whitening. The boys take a rainy day to give the cow stable a coat of lime, and are quite pleased when "Old Stranger" returning to be milked at night, starts back in affright at the clean house and does not know her own stall. Ah! these rainy days in spring! the grass seems to grow under one's feet, and such a health-giving breath as one can feel in the soft air, so full of promise and beauty.

"Forever are they sweetly blent,
In the falling summer rain."

Mud, did you say ma'am? Yes, I know all about it, but if your men folks are at all considerate for the girls and their mother, you need not have so very much of that. Of course you do not scold. Just appeal to the feelings of any boy on the subject and see the result. In the latter case he will remember for a long time your words, and slip off his boots, or wipe them clean on the outside mat. For, of course, you keep a good strong mat where they can perform this necessary operation and a box of slippers invitingly placed inside the kitchen door, are a great comfort to tired feet and tired housekeepers too.

I have been cleaning black lace with rain-water, borax and a little alcohol, afterwards rinsing in hot water in which an old black kid glove has been boiled. The edges were pulled out, and after folding, it was placed carefully under a heavy weight, and came out as good as new.

"How do you cook sparrowgrass?" asks a neighbor over the fence, to whom we have given a bunch of this, the first delicious spring vegetable. She dined on nettles yesterday though owning a farm of 100 acres, and has not yet cultivated asparagus. So we told her to cut the stalks equal length, scraping the outside fiber from the white part, throw into cold water, and then gather it up in your hand with heads evenly together, and tie in small bunches, with strings or tape; boil about twenty minutes in salted water—a little longer if it is old. Toast three or four slices of bread, cut off the crust, and into any shape you choose. Dip in the asparagus water and place around the dish. Thicken the water the least trifle, melt in it a lump of butter and pour over the asparagus, and you have a dish fit for a queen or a farmer's wife. "Mighty lot of fuss!" she answered; "I couldn't take that trouble."

Besides being a pleasant vegetable so early in the season, there is nothing better for affections of the kidneys and liver, as I have known cures in the former disease, effected by its steady use, while in rheumatism many doctors recommend it as a diet, and I have heard those so afflicted assert that they found relief. But the vegetable must be used with perseverance during the season.

PRESERVATION OF WOOLENS AND FURS.

ALL clothing liable to be eaten by moths, should be put away as early in spring as convenient. It is at this time—May, that the moth deposits its eggs, and if clothing be neglected until attacked by the larvæ of the moth, no after care will undo the mischief which could have been prevented, had we early in the season displayed a little watchfulness and energy in rendering all moth-proof. Our furs and woolens are cared for as follows:—Beat and brush thoroughly, and hang in the sun for several hours. The furs are then carefully combed, and wrapped in *newspapers* perfectly tight—we do not use camphor because we think it turns them light—and then put them away in a tight chest. Once a month they are taken out, beaten, and left in the sun for a day.

Our woolens are likewise wrapped in *newspapers*, aired, and brushed once a month, and tied up again. I have used camphor before now for woolens, but I have learned that the printing ink on the papers is as distasteful to the moths as camphor. A. E. M.

DOMESTIC RECIPES.

Cookies.

Two cups of sugar, one cup of butter, four eggs, one teaspoonful of saleratus dissolved in a tablespoonful of hot water, two tablespoonfuls of cream-of-tartar; flavor with nutmeg; flour to mix. These cookies will keep a long time.

Ginger Cookies.

One cup of sugar, two cups of molasses, two cups of lard, one tablespoonful of ginger, one teaspoonful of salt, two heaping teaspoonfuls of saleratus dissolved in a teacupful of boiling water; pour the hot water and soda over the other ingredients, and mix a little stiffer than most cookies, or they will be too short; bake in a very hot oven until of a deep brown.

This recipe makes a large panful of cookies, which are nice for farmers' wives to keep on hand. A. L. G.

Green Peas.

Peas lose their delicious flavor in a short time after picking, hence the necessity of picking them just before wanted, and the reason why persons who depend upon the markets for their supply find them so tasteless and insipid. Always wash before shelling, but never after. Reserve some of the tenderest pods, and put into a saucepan with just water enough to cover, and boil gently fifteen minutes; then skim out the pods, put in the peas, and boil another fifteen minutes—this time sufficiently cooks young, tender peas; but for those old and hard, one must allow from twenty to thirty minutes, or even longer. When they are done, there should not be more than a small teacupful of water around them. Season with a few spoonfuls of cream, salt and a little butter.

A very nice pea soup without meat can be made as follows: Boil two lettuces, two cucumbers, three onions, all of which should be chopped fine, with three pints of peas, until tender; put through a sieve or colander, and add butter, salt and pepper; have toasted some pieces of bread, break into little bits, put into the tureen, and pour over the soup—this makes about two quarts.

Stewed Water-Cresses.

Place the cresses in strong salt and water to free from insects; pick over, drain, and put into a stewpan with a very little water, butter, pepper and salt; the cresses will cook tender in a short time. They may be served with vinegar, or add a few tablespoonsful of cream, and pour over slices of buttered toast. E. M. B.

Cream Beer.

Two ounces of tartaric acid, two pounds of white sugar, the juice of half a lemon; boil five minutes, and when nearly cold, add the whites of three eggs well beaten, one-half cup of flour, one-half ounce of wintergreen essence. Take a tablespoonful of this sirup to a tumblerful of water, then add one-half teaspoonful of saleratus and drink at once.

Black Ink.

Ten grains of bichromate of potash, one-half ounce extract of logwood, one quart of soft rain-water. Let stand open for a few days, when it will be fit for use. W. L. VANDERVEER.

For Catarrh.

One teaspoonful of mustard dissolved in a tumblerful of cold water; gargle night and morning, or oftener if convenient. Or, take equal quantities of pulverized alum and loaf sugar—use as a snuff. MRS. B. DRAKE.

May-Apple (Mandrake) Jelly.

Gather ripe fruit only; wash, slice, and boil until tender, strain without squeezing, measure the juice, and add two-thirds the amount of white sugar; boil until it will jelly. It will be of a beautiful clear straw color.

MRS. MCCLOUD.

QUERIES ANSWERED.

I am advised to take lime-water for indigestion. Can I make it myself? If so please give a recipe. DYSPEPTIC.

ANS.—Lime water purchased at the druggists' is made from distilled water. You can, however, filter it yourself, which answers very well and the following proportions will be found good. Slake two ounces of lime with a little water and gradually add enough water to make two quarts; stir together immediately, covering the vessel and let rest for four hours; then pour into glass-stoppered bottles with a portion of the undissolved lime in each; when wanted for use, pour off the clear liquid from the top.

News of the Week.

VARIOUS.

A professor of Bologna claims to have invented a chemically prepared bank-note paper which cannot possibly be counterfeited.

Ohio has voted by a large majority against taxing church property.

THERE is a fish pond mania in Kentucky, and many persons who own swamps traversed by small streams, are digging them out, damming them, artificial sheets of water which making they are stocking with fish, principally trout.

About fifteen years ago the "New Idea" variety show was a resort of miners in San Francisco. A feature of the nightly performance was a reel in which girls of 14 to 16 danced. There was much rivalry among them, and the audience was generally enthusiastic. Otto Burbank, a veteran minstrel, says that the now well-known Lotta was one of the favorites, and that she there learned the dancing and banjo playing with which she still pleases her audiences. Another was Maggie Moore, now Mrs. Williamson, the mainstay of the successful "Struck Oil." Sophie and Jennie Worrel, the burlesque actresses, were also of the company.

M Edward Andre has an article in the *Illustratio Horticole*, showing that the original home of our common potato is in South America, in the Andes, near the equator. He first found it growing wild on the Summit of Quindio, near the volcano of Tolima, at a hight of 11,400 feet in latitude 4° 34' north. He next found it at 6,200 feet high in the Cauca in latitude 1° 33' north, in May, 1866. It was growing as a handsome vine, supporting itself on the neighboring trees and bearing magnificent flowers of a deep purple. M. Andre also found it in North Lima in the Amancees mountains, where in the midst of a very scanty vegetation the potato is found growing in abundance. It is equally common in the island of San Lorenzo, near Callao. M. Andre is convinced that Humboldt is entirely mistaken in his opinion that the tuber did not exist either in Chili, New Granada, or Peru.

The daily production of crude petroleum in the northern oil fields of Pennsylvania is 30,600 barrels which at 1.50 per barrel, amounts to $59,400 daily; $1,782,000 monthly, and about $21,681,000 per year.

The Emperor of Austria is a notable sportsman and the following list points to the conclusion that his subjects are pretty active in the same line. There were killed in his dominions in the year ending 1876, 54 bears, 10 lynxes, 233 wolves, 23,606 foxes, 7,112 martens, 9,327 polecats, 5,380 wild cats and weasels, 2,426 badgers, 261 eagles, 916 owls, 66 925 kites, falcons, and sparrowhawks, and 12,411 crows.

Every male citizen of Atlanta, Ga., is taxed $5 per annum for the maintenance of the streets, but whenever it is muddy they have to stay indoors, or go out on stilts.

The terrible drought which has for some time afflicted almost the whole of Australia is at length breaking up. Sheep and cattle have suffered severely, and, in many instances, owners have lost one-half of their flocks and herds. The want of water is really the curse of Australia; and it seems doubtful whether this can be ever effectually remedied, although large expenditures has been incurred in arrangements for the storage of water in threatened localities. The small land owners—"free selectors" and "cockatoo farmers," as they are called—have a very hard time of it, unless they chance to be in a singularly favored district.

Some months ago a man named Packer organized a large colony of emigrants in Allegany county, Md., collected considerable money from them to pay for handsome homesteads in Nebraska, and conducting them as far as Omaha disappeared, leaving them penniless and friendless.

A well-known English naturalist says that it is one of the old vulgar errors to suppose that a skin taken from a live animal is more glossy than that taken from a dead one.

The birth rate in Georgia since 1865 has been a little more than thirty per cent. among the whites, and among the blacks a little more than fifty. How about the "niggers" dying out?"

The first bar of steel ever manufactured in the South was rolled last week at a mill in Chattanooga, Tenn.

In England the class among whom the rate of mortality is highest are the innkeepers. For this there can be but one cause, drink. The class highest in the scale of vitality are the barristers, who are, as a class, distinguished for habits of total abstinence. The death rate is higher among clergymen than among lawyers. It is a curious fact, too, that mortality is greater among solicitors, who lead a much less stirring and bustling life, than among barristers.

On December 1, 1877, the population of Berlin numbered 1,018,818. In 1860 it was only 500,000.

Connecticut cabbage growers are far from being disinterested spectators of the struggle in Congress over the proposition to reduce the tobacco tax.

India is becoming a very serious competitor with the United States in the wheat market. The value of wheat she exported in 1875 was £14,141; in 1877, £123,473, and for 1878, £500,733.

Samuel B. Hale went from Boston to the Argentine Republic twenty years ago, and has become a considerable farmer there. His farm contains 28,000 acres of rich prairie land, enclosed with a heavy wire fence. He keeps an average of 110,000 sheep from which the wool, tallow and skins is enormous. He also has 3,000 beeves, 500 horses, and 1,400 hogs.

If the tax of $100 be placed on every Chinaman landing in California, the imperial authorities at Pekin threaten to impose a similar tax on Americans landing in China.

The fall of nearly three inches of rain in the course of twenty-four hours, which was recorded during the recent storm in London, was regarded as an almost unprecedented event, but this heavy rainfall is frequently exceeded in the Antipodes. During a storm in Sidney, described in the last Australian newspapers, as much as 10.88 inches fell in forty-eight hours. After the terrible drought which has afflicted the country, the parched earth was not equal to carrying off such an enormous quantity of water suddenly poured upon it, and disastrous floods followed, causing great destruction of life and property.

William Harley, agent of the Merchants' Trading Company of Liverpool, has arrived at San Antonio for the purpose of completing arrangements to ship Texas cattle and sheep direct to England. The cattle will be sent by rail to Galveston, and thence by a special line of steamships, about being built, to Barrow.

St. Petersburg possesses 670,000 inhabited houses. The first brick dwelling was built in 1710, two years before the city was made the seat of Government. Excluding still-born children no fewer than 5,725 deaths occurred there between May and August last, or over 34 in every 1,000 of population.

France proposes spending $150,000,000 on her army, and $45,000,000 on her navy in 1879. The low pay of French soldiers is partly compensated by the fact that they can buy their tobacco from the Government on very low terms, and travel everywhere through the country at half price.

In the schools under the control of the London School Board, teachers, male and female, usually begin at $350 a year, and the greater number do not get beyond $450.

Russia preserves eight crowns of provinces conquered at various times and joined to the Empire—Siberia, the Crimea, Kiew, Astrakan, Kasan Finland, Poland, Krussinia.

There is a factory in Davenport, Iowa, for making sugar from Indian corn. The product somewhat resembles maple sugar, and sells readily in the neighborhood. The sirup is especially liked.

Among the meetings to be held in Paris this summer will be one of beemasters and insectologists, when insects noxious to vines and agriculture will be discussed, with a view to all sorts of lethal experiments. The Colorado potato beetle will meet with especial attention.

Before the Gregorian reformation of the calendar in 1582, such was the state of confusion into which things had fallen that from 1500 to 1582 no fewer than fifty-four Easters out of eighty-three had been wrongly celebrated, and if this had continued, after A. D. 2693 there would have been no legitimate Easter.

The gentlemen kerosene oilers of the Commune complain bitterly of the vast amount of freedom left to policemen in the larger American cities.

Manufacturers of Ladies' Suits, that use the Davis Vertical Feed Sewing Machine, are doing the sewing in the most elegant manner, and entirely without basting, or showing the stitches, by the use of very simple attachments. The invention and introduction of the Vertical Feed is an invaluable addition to Sewing Mechanism. The old under-feed machines will be rapidly superseded by this new and more perfect device for sewing, as it is adapted to every variety of work. The Davis Sewing Machine Company are building an addition to their large manufactory at Watertown, New York.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 11, 1878.

BEANS AND PEAS.—Very heavy receipts for the season continue to weaken the market, and it is not improbable that the rate for Medium will go lower. A better export trade in Marrows has set in, but with the free offering, sellers have to shade prices. The best quality of Pea seem to have been absorbed in the late demand; the remnant is dull, at quotations. White Kidney also quiet. Red Kidney more freely, with better prices noted for prime. Green Peas at the stations sell for $1.00; Choice Stored at $1.10. Southern S. G. Peas $2.85@3.00 nominally. Canadian Field in bulk and bond steady at 8@81c.; receipts being taken for export; shipped last week, 32,250 bush. Export of Beans 1,675 bbls. mostly for Cuba. Receipts of beans 8,550 bush. medium beans, choice, $1.60@$1.65; fair to good, $1.50@1.55; marrows, prime, $1.50@1.75; fair to good, $1.50@1.60; pea, $1.40@1.55. White kidney, $1.60@1.70; red, $2.25@2.42½; Black (Turtle Soup) $2.40.

BUTTER.—The market has not recovered from its recent decline. White or streaked lots of State have a very undecided position and must be named very low to induce sale; particularly as fine fresh yellow is quoted almost down to oleomargarine figures. The liberal supplies of butter this spring, thus far have been very sagaciously handled by New York merchants, and for once there is little fear of white blockading the position of grass. This is the case with State, and it is not likely that the West will risk shipment of fodder-fed stock that will be almost sure to sell at a loss. Another mark of this extraordinary season is a record of interior packing in State dairies in the month of May. The general demand is fair, and likely to improve at the prices. There has been considerable export, but sellers cannot depend upon a prolongation of foreign call, as Continental and British production at this season relieves consumers from a dependence on American. Receipts for the week 24,500 pkgs.; exports for past week 2,907 pkgs. We quote:

State creamery, choice 21@22c., a few at 23c.; fair to good 18@20c.; Half tubs and pails selected, 19@20c.; fair to good, 15@18c.; Welsh tubs, choice, 18@19c; other useful, 15@16c.; poor or stale State 12@13c.; Western, creamery range with State; Western dairy fine 16 17c.; other, 12@15c.; factory (tubed) 13@14c. do. (milled) 11@12c.; poor Western 7@10c.; do. and grease, 4@8c.

BEESWAX.—Is offered lower with freer supplies, quoted at 27@28c. for Western and Southern.

Exports past week 1,000 lbs.

BROOM CORN.—A small business is in progress. Quoted at 6@7½c for hurl and short brush; 5@6½c. for medium green, 4@5c. for red and red-tipped, ₱ lb.

COTTON has been very dull, but closed a trifle stronger on the improved English advices. Latest prices are 10.59c for May; 10.76c. for June; 11.08c. for July; 11.11@11.12c. for August; 10.81@10.82c. for September; 10.64@10.65 for October; 10.54@10.55c. for November; 10.55@10.56c. for December; 10.65c. for January; 10.74@10.76 for February; 10.83@10.86c. for March, and 10.92@10.95 for April.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Stained.

Good ordinary, 7 ⅞c. Strict ordinary, 8⅜c.; Low middling, 9⅛c.; Middling, 9⅝c.

CHEESE.—Prices have been steadily giving way all through the week, and closed fully one cent under last week's prices. This has been wholly due to the increasing receipts, and the fact that the English advices have not been at all encouraging, and business consequently obliged only as forced. About 3,200 bbls. have been taken for shipment this week, closing with free sellers at 11 for fancy factories, and now and then a parcel of extra quality reaching 11¼.

For factories, 11@11¼c. for best lots, 9¾@10 c. for good and prime; 5¼@7c. for half skimmed, and 3@4c. for skimmed. State, farm dairy at 9½@10¼c. for good to choice and 3@4c. for poor skimmed. West-

ern at 11@11¼c. for fine; 9½@10½c. for good to prime. western flat; prime, 10½c.; good at 9@10c. half skimmed, 5@6½c.; skimmed, 3@4.

Exports for the week, 32,052 boxes.
Receipts, 43,548 do.
Gold closes 100¼.
Liverpool cable, 64s. old cheese.]

DRIED FRUITS.—There has been an exceptionally dull market the past week, nothing doing outside of a jobbing way, and prices unsettled and easy.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia 10@11c.; good to prime Georgia; 8@10c.; un. peeled halves, 4½c.; quarters, 4c. Pitted cherries choice new, 27@28c.; Raspberries, 27@28c. New York State plums, 13@14c.; southern plums, 11@12½c. Blackberries, 10@ 0½c. Apples—State quarters, 4½@5½c.; do sliced, prime, 6@6½c.; good, 5c.; Western quarters, 4@4½c.; Southern at 6@7c. for prime sliced, 5@5½c. for fair to good; Southern quarters, 4½@4½c.; Tennessee quarters, in bags, at 2½@ ½c.; prime and fancy North Carolina sliced at 5@5½c.

Exports for the week, 210 bbls. dried apples.

EGGS.—Receipts for the week, 12,012 bbls.; do last week, 9,193 do. Quotations for Western have touched 13½c. during the week; but after the long reign of low figures, buyers limited purchases when prices hardened to that extent. It crops besides have loosened again and dealers all report a weak market at the close as follows:

Near points, 13@14c.; State and Penn., 12½@13c.; Western and Canadian, fresh, 12@12½c.; fair Southern 11 @11½c.; inferior or stored eggs, 11c.; Duck, 14 @15c.; Goose, 25@30c. Neither d. or g. wanted.

FRESH FRUITS. — Apples quoted as before with stock mostly gone. Selected $5@6 ₱ bbl others $3@ 4.50. Strawberries were in large supply yesterday, over 200,000 quarts offered mostly from Norfolk. Low prices gave them a wider distribution than they have yet had. Maryland and Delaware fair to prime, 12@18c: Norfolks 10@14c.; Charleston and North Carolina, fine, 15@20c., poor berries irrespective of shipping point, 5@10c.; Md. Gooseberries quoted 8c. ₱ quart. Choice blackberries, 12c. neither wanted though the latter were the first ever seen here in May Black Hamburg grapes (hot house), $1.75@2.00 ₱ lb. No more cranberries; the crop has paid fairly. Peanuts quiet, but holders have awaited the customary demand so long they think they can meet the warm weather, call at full late prices Va. handpicked, $1.35@1.40; prime to extra $1.20@1.30; common to fair 85c.@$1.00. Pecans 6@8c.

Receipts of peanuts, 1,640 bags.

FLOUR.—With lower prices for wheat and full supplies, prices have been steadily declining and closed weak.

Latest prices are $4.15@4.60 for very poor to choice superfine State (fancy lots up to $4.75, an extreme); $4.65@5.00 for poor to good extra do. odd lots and lines; $5.00@5.10 for good to fancy do.; $4.10@4.60 for very poor to choice superfine, Indiana, Iowa, Michigan, Ohio, &c., (fancy lots at 10@15c. higher figures, but these extreme); $4.60@5.00 for inferior to good shipping extra do., and $5@5.40 for good to fancy extra do.; common to choice white wheat extras, $5.15@6.25; choice to fancy do. at $6.25@7.25; red and amber winter wheat, inferior to choice trade and family, at $4.85@6.25; round hoop Ohio at $4.75@5.10 and trade and family brands of do. at $5.15@6.25, the latter rate for choice; (fancy lots quoted higher); St. Louis, $4.90@5.75 for very poor to good extra, and $5.75@6.50 for good to very choice, with a few brands of fancy quality quoted up to $7.00@7.25); Minnesota clear, very inferior to very choice at $4.60@6.00 (a few fancy brands quoted higher); Minnesota "straight," inferior to very fancy, at $5.50@6.75, and patent poor to fancy choice at $5.75 @8.00, outside stock at from $2.25@5.75; city mill extra at $5.80@6.10 for fair to very choice for West Indies; do. for England at $4.75@4.90; do. trade and family extras, $6.25@7.25; do. for South America, $5.20@7.00 for fair to fancy; No. 2 at $2.70@4.00 for very inferior to very fancy.

CORN MEAL.—Sales at $3.00@3.10, for Brandywine and $2.85@$2.95 for Western.

FEATHERS.—Duck, 20c.; extra white geese, 45c.; mixed, 40@42c.; scalded, 35c.

BFURS AND SKINS.—Advices from the auction sale at Leipsic show an advance in eastern and Halifax muk of 10 per cent., and a decline in coon. Red and Gray fox of 10 per cent. as compared with London March sale. Other grades of mink were only half sold. Beaver, muskrat and skunk and sold at the same rates as at London March sales.

FEED.—Sales of 40 lbs. at $15@16.; 60 lbs. at $15.50@ 16; 100 lbs. at $17@19. Rye feed, $17@18, and Sharps at $15@20.

GRAIN.—Prices throughout have ruled much lower, and closed with free sellers on the same advices from the other side, and large receipts. Latest sales of wheat are:

New York No. 2 red at $1 30@131; No. 1 red at $1.35; amber Michigan at $1.33½; No. 1 white at $1.38; white State at $1.40@1.41; No. 3 red at $1.25. red Canada in bond, $1.30; Canada spring, in bond, $1.17; No. 1 spring at $1.21@1.27; No 1 Milwaukee spring (to arrive) $1.25; New York No. 2 spring and No. 2 Chicago spring, at $1.20; No. 3 spring at $1,18 1New York No. 2 red, June options, at $1.21¼; New York No. 2 spring, May option, at $1.18½@1.19; do., June option, at $1.19¼@1.19¾; No. 2 Northwestern spring, May option, at $1.21¼@1.21½; do. June option, at $1.21. Rye at 71@72c for Western, and 73@75 for State. Corn, New York No. 3 at 51@51¼c.; New York No. 2 (old) in store, 55½c.; Kansas mixed, 41¼@42c.; New York No. 3, 46@48½c.; ungraded mixed 49@52½c.; yellow western, 51c.; white Southern, 55½@56c., and Jersey yellow, 53c.; New York No. 2, May delivery, 51@51¼c.; do. June, 51½c.; do. July, 51½c.; steamer mixed, May, 49@49½c., do. June, 49c. Oats, No. 2 Chicago at 35c.; New York extra white, 40c.; New York No. 2 white 35¼@35½c.; New York No. 1, 35c.; New York No. 2, 31c., New York rejected, 33c.; mixed Western, 31@31c.; white Western at 35¼@40c.; mixed State, 31½@35¼c.; white State, 35@38c.

HAY AND STRAW.—Supplies are not so large, and with demand freer prices are steadier.

Bale hay, 55@60c. for shipping, and 70@80c. for retail qualities; clover, 50@53c. for prime. Straw, 40@ 50c. for long rye; 35@40c. for short rye, and 40@45c. for oat.

Exports for past week 1,411 bales. Since Jan. 1st 25,000 do.; same time last year, 22,500 do.

HOPS.—Exports for the week have been 500 bales. Brewers have bought only a few small lots, and the general market is dull. The medium grades sell at irregular prices. The quotations are for:

New Yorks, good to prime, 7@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5 @8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

LEATHER.—Hemlock sole at 19½c. to 21c. for light, 19½ to 20½ for middle, 20 to 21 for heavy and 17½@19 for good damaged.

OIL-CAKE.—Western quoted at $30@30.50 per ton.

MAPLE SUGAR.—Supply small; season virtually over; cakes, 10@12c., sirup, 75c.@100 per gallon with can.

PROVISIONS.—Have been very dull and lower, closing weak.

Mess pork, $9.40@9.60 for spot lots; $9.20 for May and June and $9.30 for July. Bacon at 4¼c. for long clear and 5½c. for short clear. Lard—Western steam, 7.15@7.17½c. for spot, lots, 7.15@ 7.17½c. for May and June and 7.25c. for July. Stearine 7¾c. for Western. Tallow, 7¼@7 3-16c. for prime. Beef hams at $16@16.50. Beef—New extra mess, $12.@12.25; plain, $10@11.50; packet $13.50@14.50 bbls. family mess, $15@16; extra India mess $22@24 for city brands; do. Philadelphia, $20@21.

POULTRY AND GAME.—Live has ruled dull, and would have gone lower, but for a fortunate late order from Havana which cleared the coops of fowls. Turkeys no longer wanted alive. The steamer and hotel demand can be fully supplied from Pa. Spring chickens active at 50@$1.00 ₱ pair; Fowls, choice, 12@13c.; Western, and Southern 12@12½c.; Roosters, 6@7c.; Turkeys, 10@12c.; Ducks, choice, $1.12; poor to fair, 50@75c., the lowest for Southern; N. J. Geese, $1.25@1 50; other, 70c.@$1.

Dressed poultry in light supply from the country. Interior scalded lots not wanted, City dressed is far ahead of it in appearance. Capons not marketable. Turkeys, 12@13c.; Fowls, extra, 14@15c.; good to prime, 10@13c.; very common, 8@9c.

The few items of game are common and have lost their novelty. English snipe $2 ₱ doz.; Plover, $1.25; Sand Snipe, 45 50c.; wild pigeons, stall fed, $1.10@ 1.30; flight, 60@75c.; squab, 2@10.

SEED.—Grass are very dull: clover at 7¼@7½c. for Western and 7¾@7¾c. for State; Timothy at $1.30@1.40.

SUGAR.—Refined at 9¾ for cut loaf, 9¾ for crushed, and powdered, 9¼ for granulated, 8¾@9¼ for soft white and 7¼@8¼ for soft yellow.

TOBACCO.—Export demand is very fair, and there is confidence as to prices which, however, are not showing a quotable advance.

Missouri, Kentucky, and Tennessee—Washed fleece, 34@35c.; unwashed, 23@26c.; unwashed combing, 28@31c.

LIVE STOCK MARKETS.

NEW YORK, May 11, 1878.

BEEVES.—Receipts for the week, 8,995 head; do., last week, 10,277 do. The closing important day of the week, Friday, was attended by a very buoyant market. Prices showed an advance of ¼@½c. per pound compared with Wednesday. Shippers and home buyers paid 10¾c. for picks. Quality was exceptionally good and a better average price was obtained than has been noted for many months. Nothing decent sold yesterday under 9½c., and the range was 9¾@10¾c. for medium to best steers. Fat bulls, 3¾@4¼c.

COWS AND CALVES.—The demand would use a few extra milkers but New York prices offer no inducement for sending a quality that could not be readily replaced for the same money at home. Poor stock takes a chance sale. Really good fresh cows worth here $55@65.

VEAL CALVES.—The market has been weak, but with moderate arrivals closes a shade stronger. Prime New Jersey, 6c.; good, 5@5¾c.; State fair to good, 4@5 ¾c. Buttermilk extra 4½c.; other, 3@4c.

SHEEP AND LAMBS.—Receipts for the week, light. Sheep firm at 6c. for fair unshorn and 5@5¾c. for ordinary to choice clipped. Lambs dull at 7@ ½ for Kentucky and Virginia, and 9@10½c. for New Jersey.

SWINE.—Receipts for the week, 27,086 head; do. last week 30,390 do. Live quoted steady at 3¾@ 3¾c., the lower for Western.

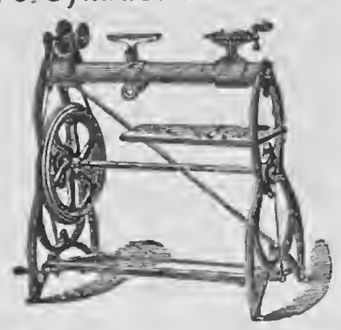
PLEASURE FOR THE AMATEUR.



BUSINESS FOR THE MECHANIC.

This is a NEW LATHE, on a NEW PLAN, having a Cylinder Bed, which is much more simple and convenient than the old style. It has attachments for circular and scroll sawing and bracket molding. New, Novel, and the Best Invented. Manufactured and sold by the

BATTLE CREEK MACHINERY CO.,
BATTLE CREEK, MICH.

Send for Circular and Price List.

Halladay Standard.

The only Wind Mill awarded

TWO MEDALS

and

TWO DIPLOMAS

by the

CENTENNIAL JUDGES.

Every machine warranted to be well made of good material; to do good work in any kind of wind; to be perfectly self regulating; to possess more power and to be more reliable than any other Wind Mill made.

Each piece is fitted and numbered so that a stranger can put the Mill up, using our drawings and printed instructions for a guide.

Send for Catalogue "B" and Price List.

U. S. WIND ENGINE & PUMP CO.,
BATAVIA, ILL.

LADIES IF YOU WISH TO COLOR— Use Leamon's Dyes.

Warranted the best and cheapest Dyes for all family and fancy dyeing. Dresses, Cloaks, Coats, Ribbons, Ties, Feathers, anything, can be colored any shade. Anyone can use them. The expense is trifling. We especially recommend the Black as much better than logwood. Sold by druggists, or any color sent by Mail, large size, 25c., small size 15c. Send for Dye Book and beautiful Samples, Free.

WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

Use the Anti-Friction Hay Carrier.

For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distances. No trouble about getting over high beams and to the end of deep mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons have been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "B" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

USE THE BUFFALO

HONEST FERTILIZER

Ammoniated Bone Super Phosphate,

AND

Pure Ground Bone.

The purity of these goods is guaranteed, and their standard proved by regular analyses of Prof. G. A. Liebig, and other eminent chemists.

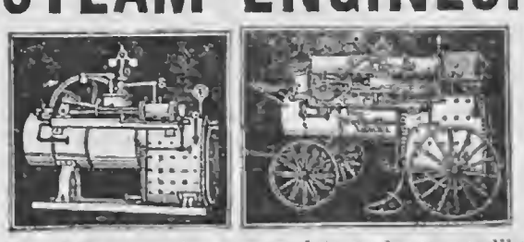
No Rock Phosphate, Mineral Guano, Land Plaster, Salt Cake, Spent or Sludge Acid, and other inferior materials, enter into the manufacture of my Phosphate, which is solely made of **Bone, Meat, Blood, Pure Acid and Potash Salts.**

My Works are always open for inspection to every consumer of Fertilizers.

Highest Premium and Medal of Honor awarded to my Fertilizers by the Centennial Commission, Philadelphia, 1876.

Send for new Spring Circular, containing full directions and testimonials. L. L. CROCKER,
252 Washington Street, Buffalo, N. Y.

STEAM ENGINES.



More effective and more complete, and more readily adapted to the various mechanical and agricultural uses than any other in the market. Practical improvements, accumulated from 20 years' manufacturing experience, with reputation maintained and success established.

Send for Circulars, descriptive, and containing testimonials concerning our PORTABLE, STATIONARY and AGRICULTURAL STEAM ENGINES.

WOOD, TABER & MORSE,
Eaton, Madison Co., N. Y.

KILL

The POTATO BUGS

AND SAVE THE POTATOES.

SURE DEATH to the Colorado Potato Bug is only to be had by the use of Paris Green. Prof Cook and others say that all other remedies have failed. ENDORSED BY A. S. FULLER, AGRICULTURAL EDITOR OF THE "SUN."

PURE PARIS GREEN

Made by F. W. Devoe & Co., can be relied on for the extermination of the Potato Bug and Cotton Worm. Circular on the use of Paris Green distributed free on application.

F. W. DEVOE & CO'S

MIXED PAINTS.

For the convenience and economy of consumers of PAINT the well-known house of F. W. DEVOE & CO. now prepare

PAINTS READY FOR USE

FOR FARMERS and MANUFACTURERS.

They are uniform in shade, and the colors can always be matched. Any one can paint with them. No need of a painter to mix it for you. No need of a dryer or other ingredients. The paint is ready for immediate application. Send for sample cards showing different shades. They have very superior covering properties and do not, like the so called patent paints, contain either water, benzine or alkali. These Paints are in Liquid Form, and are sold in Gallon Cans and Barrels. They are also put up in small cans of one to five pounds.

F. W. DEVOE & CO.,

Manufacturers and Importers of Colors, White Leads, Zinc White, Varnishes and Artists' Materials, CORNER FULTON AND WILLIAM STS. (OLD DUTCH CHURCH CORNER), NEW YORK CITY.

BRADLEY'S

CHANGEABLE SPEED MOWER

Has more good points, less complication, more adaptability and less parts than any other Mower in the world.

BRADLEY'S

AMERICAN HARVESTER, No. 2

The lightest, strongest and most durable single Reaper in the market.

For simplicity, durability and quality, these machines cannot be excelled. Every machine fully warranted to be as represented.

At the Great Mower and Reaper Trial, held at Watertown, N. Y., July 6-7-9th and Aug. 8th, these machines carried off the Highest Prizes, viz., Two Grand Silver Medals, over the Wood, Buckeye, Wood's Eagle, Meadow King, Warrior Eureka, &c.

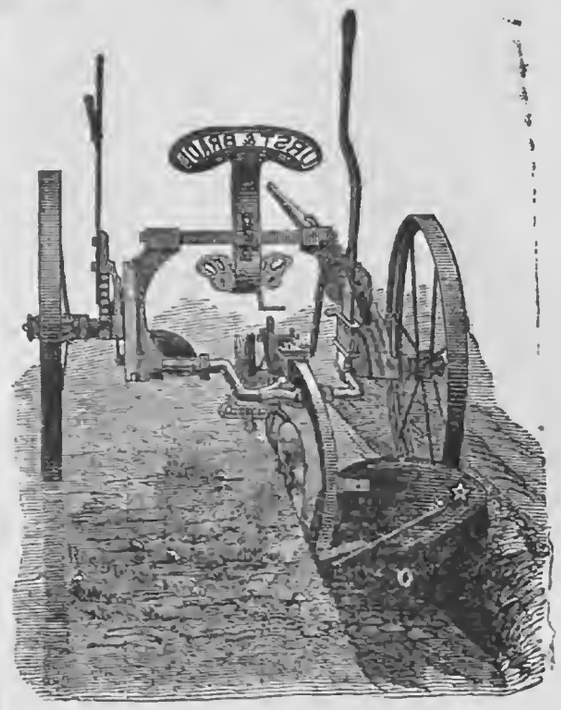
Circulars, descriptive of these machines, sent free by addressing BRADLEY & CO.,
Syracuse, N. Y., or Chicago, Ill.

ENTIRELY NEW.

Just Patented.

The Furst & Bradley

Iron Frame Sulky Plow,



With Stubble Plow or Breaker Attached,

As may be desired. It embodies

SEVERAL NEW FEATURES

CONTAINED IN

NO OTHER SULKY MADE,

And which are necessary for the PERFECT working of a Sulky Plow. If you wish to consult your BEST interests, be SURE, before buying, to send for our sixty-four page pamphlet (sent free), containing full description of FURST & BRADLEY

TO PRESERVE THE HAIR,

Stimulate its Growth, and render it soft and glossy, use Dr. Jayne's Hair Tonic. This unequaled dressing for the hair, being free from all deleterious substances, exerts a beneficial influence on the scalp, removes dandruff, and in most cases causes new hair to grow.

Reading for the Young.

THE EXPLORER.

Out of the unknown into the known,
From the infinite sea to the sea of time
Cometh a voyager, sailing alone,
Steering with confidence all sublime
Straight to the land of joy and rest,
The tropic isle of his mother's breast.

Little he cares whether hall or cot
Shelter his shallop from wind and wet;
Cotton or velvet, he heedeth not—
Peasant or lord—they are nothing yet!
Crown for head and sceptre for hand
Are toys and play-things in baby-land.

Oh, but he finds out wonderful things!
The dome of his cradle high and wide;
The drowsy sense when the mother sings;
The swinging ebb of the outward tide,
Which somewhere underneath him seems
To drift him into the land of dreams!

Then wide awake, from the distance dim
In far, mysterious realms of space,
A soft, bright moon doth rise for him;
The tender rounds of his mother's face.
In this wide world finds he charm on charm.
As he rides round the room on his mother's arm.

Smiles and tears in your bonny eyes,
Shine and cloud on your coral lips,
Little explorer out of the skies,
Searching out truth with your finger tips!
You know not yet, as we old folks know;
There is nothing new in this world below!

Ah! what disdainful looks you cast—
Captain who sailed from the unknown shore
Rogue's eyes answer me; "Not so fast,
Filling my eyes with your well-worn lore;
Baby or fairy or sprite or elf,
You'll find I am something new myself!"

[Golden Rule

"POCKET MONEY FOR THE YOUNG PEOPLE."—No. 2.

S. RUFUS MASON.

How many ways there are for farmers' boys to gather up a little small change, that city boys cannot enjoy! How much pride—honest pride—a lad feels when he can say "I earned all that by using my wits and my hands instead of letting them lay idle!" The mere amount of money thus obtained, although to the boy it looks immense, is really the least of the advantages gained.

His mind is exercised in devising salable articles, in laying plans to produce them, in the best mode of supplying a market already existing, or in creating a new one; his spare time is occupied at home, and to the total exclusion of idle associates, who always abhor a workshop. He thus early in life learns to buy, to create, and to sell; to be economical, careful and pleasant-mannered, because all these faculties must be developed to insure success. Then when he has the shining fruits of his labor in hand, he lays it out in the purchase of some useful book, some tool, or material to enlarge his ability to carry on the business he has embarked in.

This is of itself an education, and with a little assistance in the way of facilities from his parents, will lay the foundation for a better man than is usually made out of the mischievous street Arabs of the towns and cities. This much to the boys. To the parents I appeal, and ask them to look into the matter closely: it will claim as much of their sympathy as they can possibly feel in the future of their sons, and will prove of so great benefit to them and the whole family as to make home more a true home than ever before. Let each father at once consider how he can best assist, in a moderate way at first, to foster industry and forethought, carefulness, neatness and business habits in his boys, by setting aside for them a piece of land, a few seeds, a little lumber, a few tools or any material upon which profitable labor can be expended. I know from my own early experience how valuable this may be made to every boy in the land.

Almost every lad has some predilection, some "turn of mind," which if carried out in practice, is sure to lead to good results. In selecting a line in which to exercise one's faculties for profit, this "bent" should be cultivated. It is up-hill work for a boy to labor against his peculiar fancies, and in deciding upon a line of business, let inclination guide if possible. An inquiry at the stores will assist in the choice of an article to raise, and the ease with which the facilities available can be used, will decide the point. A calf, pig, some poultry or a colt, will always pay; a crop of beans, tomatoes, potatoes, pop-corn, anything neglected by others, will find a ready market, and if well managed will give a surprising profit.

Do not be ashamed to ask advice. Form a plan of operations, write it down, and then carry it out. Get the soil in the best order, get the best possible seed, and give it the same constant care which you would to a prize essay, and you need not fear the season. Let every operation be thorough in season, neatly performed, and try no experiments.

When market day is at hand, go boldly forward, describe your goods exactly; let there be no concealment of bad points, state the truth, the whole truth, and nothing but the truth, and if your product does not give you quite so much money as was expected, you will have formed a character for honesty which will stand as a foundation for all your life.

To conclude this article then, do not let the desire for spending-money tarnish your good character in the smallest degree.

CHARACTER AND CONDUCT.

BY BENJAMIN CLARKE.

Can there be anything more important than conduct? Yes, *character* is more important than *conduct*. I have dwelt on one line of conduct, because that mainly relates to you as Sabbath scholars: but character is developed in every relationship; character is being always formed; character is, in fact, yourself.

A man is what his character is, not what his conduct is. A moment's reflection will convince you of this,—will show you that often the conduct may be all that could be desired, under given circumstances, when the character may be faulty.

Conduct is largely influenced by outward circumstances, character is formed within. Character controls conduct, and the controlling force must be the more important. Character is always being affected for good or evil; the lines of character must be much more subtle, therefore, than those of conduct. The character is continually either being strengthened by virtue or impaired by sin.

Let me give as an illustration, a story of a school-girl in America. It was the eve of the half-yearly examination; it was her last term at school, when she would be seeking some engagement; and she was most anxious to secure the best position in the school. She was doubtful, however, about the chemistry paper that would be set; in fact, it was the only subject of which she was afraid; but it was all-important to her, because she and another were so nearly equal in the class that a single paper done indifferently would decide the prize.

The mistress wanted some book from her desk, and sent Mary for it.

What was it that made Mary start?—that sent the color to her cheek?—that sent the finger to the lip? Why did she draw back her hand from the desk so hastily? Was there anything to bite?

Yes, there was temptation lurking there; for right before her lay the book containing the questions that would be set for the chemistry examination. A single peep, and she would have some idea of the questions to be set. Should she look? The temptation was strong: and was backed by some plausible reasons, but honor was stronger and taking up the book for which she was sent, Mary slammed down the desk as though she would at the same time crush the serpent that lay there.

Next day the examination was held, and, as Mary feared, she did not do well in chemistry, though satisfied with her other papers.

Anxiously the result was waited for, and when it was announced that Mary was second, her friends crowded round her to sympathize with her. Of course she was disappointed, but they were surprised to find her so little so, when she answered them with a quiet smile, "Never mind."

It was the last day of the term, and the prizes were to be publicly awarded. Visitors and friends of the pupils came, and the girls felt that the best part of the prizes was to have them awarded before so distinguished a company. When Mary's competitor went up certain eyes were turned in pity towards Mary, but no shade of vexation or disappointment clouded her face, but instead of a a smile of satisfaction played thereon.

Later in the day the mistress called Mary to her, and said, "My dear, Mr. —— has been asking me if I could recommend him a young lady as secretary and amenuensis. Her duties would not be heavy, and they would be liberally remunerated; but he insisted that she must be a girl of unimpeachable honor, for she would be intrusted with important and confidential papers. I have recommended you, Mary, because I have always trusted you, and because I have recently had a strong proof of your honor, when I know it must have been tried. Shortly after I sent you to my desk I had occasion to go there, when I at once saw the book containing the questions. How foolish! thought I. Nay, how wrong to expose her to the temptation! But I never doubted you, Mary; just then the sun shone into the desk, and revealed a tiny spider's web across the book, and I knew at once that you had resisted the temptation."

But before that something else had shone into that desk—Mary's character, stronger and brighter because of the temptation resisted. That was a fine line that revealed to Mary's teacher her trustworthiness and honor; but finer than any gossamer threads are the lines which daily indicate how character is formed. "Line upon line, line upon line; here a little and there a little."

A VISIT TO A MODEL SCHOOL.

S. B. P.

On our first entrance I was agreeably surprised at the large area of blackboard, so arranged as to be within easy reach of the tallest as well as the shortest pupil; and with the skillful arrangement of light and shade, so as to make the light agreeable in all parts of the rooms at all times during school hours. Not less was I pleased with the pictures on the walls, the mottoes on the blackboards, the outline maps and the wreaths of evergreens and flowers that met my eye. The seats and desks were carefully arranged so as to accommodate the natural positions of the bodies of the different grades of hight, and I detected no bodily weariness in the occupants.

Having been a schoolboy "once upon a time," I could not help going back in memory to that time when I sat for seven long, weary hours, each day, with a book before me, or with folded hands, upon a slab bench without back, and at first so low that my feet and lower limbs were an encumbrance, and afterwards, as I increased in literature and altitude, being promoted to a bench and desk so high that my limbs were entirely too short for me; for there were only two grades of seats to accommodate the whole school, composed, as was then the custom in country places, of pigmies, and all the way up to giants. The walls of my *alma mater* were *not* decorated with either maps, pictures, evergreens or flowers, but with daubs of ink, pencil marks and cuts of jack-knives, and all the blackboards with which the house was furnished were desks and seats blackened with ink, begrimed with dirt, and ornamented in intaglio with cuts of jack-knives in squares, triangles, parallelograms, circles, rhomboids and all other geometrical and fanciful figures. Such were my recollections and reflections, as I took my seat among this assemblage of smiling, happy juveniles.

Miss M., the teacher, has her own way in the manner of teaching either science, literature or morals; being encumbered by no statutes, no ordinances of municipalities or rules of school boards. All the laws by which she is governed are the laws of kindness, firmness and affection, and all her rules are, that all under her charge shall preserve and practice order, cleanliness, respect for their parents, seniors and each other.

Public schools are a necessity and a blessing, and the attention paid to them, and the care bestowed on them by the public and the legislators of the present era, is one of the most marked evidences of the progress of the age. But there must necessarily be for their management laws and rules for the government of the masses, which are not always the most proper for individual cases. These rules cannot fail to operate somewhat as a bar to any profit by the individual experience of the teacher and to any improvement in method which he might otherwise invent or suggest.

Miss M.'s school-room, though in a second story, which is not preferable, has easy and safe means of ingress and egress; has a convenient hall and recitation room, in which latter is taught the alphabet by two of the older girls, thus ingratiating the young ladies into the secrets of teaching, to which they aspire, and for which, judging by the eye and ear, they will soon be eminently qualified; and their places filled by the next in the scale of progress.

I have hinted that Miss M. adopted practices peculiarly her own: she has some certainly not sanctioned by the "authorities." Instance: a dog, from pure affection and by the means with which that friend of man is peculiarly endowed, scented his way into the school-room and to the side of a member of the family to which he belonged. Instead of being driven out with poker and broom, he was allowed to be caressed and quieted, and there followed, during the presence of his dogship, a lecture on zoology,—especially of the canine race. So also of a kitten, which some unfeeling person had thrown into the street, and which had wandered into the room; there followed a lecture on felines, from the lion down to pussy. And there was seen through the windows the blows, and heard the curses bestowed upon a poor, tired horse; all this was the occasion of a lecture on cruelty to animals, and on the services rendered to man by the horse and ass; all which were more interesting and better remembered for having the live subjects before them. These and many other episodes gave not only valuable information to the pupils, but a rest from brain labors, the value of which should never be overlooked.

Miss M. is not content with teaching merely that which is required for the public schools, but practices and believes, as believed a noted ancient philosopher, that children should be taught specially that which will be useful to them in after life. As to her manner of teaching, I noticed little that is new or peculiar, except in its thoroughness and its adaptation to the particular cases of each individual. The health of her pupils is not the least of her cares. They are provided with ample out-door play-ground and encouraged to use it when weather permits. She believes in the science of mnemonics, and endeavors to associate in the minds of her pupils the orthography, pronunciation and definition of each word that occurs in their lessons. She, believing and knowing also that isolated words are not only hard to remember, but that they are thus worthless; their value being only in forming a part of a sentence, therefore columns of words are never used, either in reading or spelling, and are never referred to except as illustrations of certain principles. The main effort in her teaching is to impart a knowledge and a correct use of language, believing that the sum and substance of that ignorance that stultifies is ignorance of language, and that wisdom is only taught through that language which is understood.

Whatever you do, have system about it. It is the greatest labor-saving machine in the world, and the cheapest, but it is not the easiest governed. It requires reason and management to control and exercise it. Yet, wherever it has been introduced, this great labor-saving machine has been a success, demonstrating to the world that it has saved its operator unnecessary manual labor, a multitude of perplexities, kept his workshop in order, and enabled him to perform correctly more by far than in its absence would have been possible. It has many a time kept its possessor from exasperating entanglements; it has saved him time and trouble; it has kept his business rectified while others have been confused. System! It has ever been a victor in war, it is the powerful sceptre that the true statesmen and the political economist sway in goverment and it has been and still is the commonest stepping stones to individual fortunes. Have system in your management, and you will find eventually it will outweigh the physical forces of energy without it.

Keep Busy.—The boy who has nothing to do is the most miserable of beings. If you have no regular work, do little jobs, as farmers do when it rains too hard to work in the field. In occupation we forget our troubles. The boy whose mind and hands are busy, finds no time to weep and wail. If work is slack, spend the time in reading. No one ever knew too much. The hardest students in the world are the old men who know the most.

Sabbath Reading.

LOST AND FOUND.

I lost the brook as it wound its way.
Like a thread of silver hue;
Through greenwood and valley, through meadows gay
'Twas hidden away from view:
But I found again a noble river,
Sparkling and broad and free,
Wider and fairer growing ever,
Till it reached the boundless sea.

I lost the tiny seed that I sowed
With many a sigh and tear,
And vainly waited through sunshine and cold
For the young green to appear;
But surely after many long days
The blossom and fruit will come,
And the reapers on high the sheaves will raise
For a joyful harvest-home.

I lost the life that grew by my own
For one short summer day;
And then it left me to wander alone,
And silently passed away:
But I know I shall find it further on,
Though not as it left me here;
For the shadows and mists will have passed and gone,
I shall see it fair and clear.

I lost the notes of the heavenly chime
That once came floating by;
I have listened and waited many a time
For the echo, though distantly:
But I know in the halls of glory it thrills,
Ever by day and by night;
I shall hear it complete when its harmony fills
My soul with great delight.

I lost the love that made my life,
A love that was all for me;
Oh! vainly I sought it amid the strife
Of the stormy, raging sea:
But deeper and purer I know it waits
Beyond my wistful eyes;
I shall find it again within the gates
Of the garden of paradise.

I shall lose this life! it will disappear,
With its wonderful mystery;
Some day it will move no longer here,
But will vanish silently:
But I know I shall find it again once more,
In a beauty no song hath told:
It will meet with me at the golden door,
And round me forever fold.

[M., in Golden Hours.

A WORD BY THE WAY.

Several years since two merchants had taken their seats in the morning train for a certain city. They were neighbors, dwelling in a contiguous suburb, and doing business in a large and populous town. Although their residences were near together, and they saw each other daily, they were not intimate. They had few sympathies in common. One had been for many years a professed disciple of Christ, loving God's house, and alive to all that pertained to the spread of the gospel. The other was a respectable and successful merchant, absorbed in business, and to all appearance indifferent to all beyond this life. On the morning in question these two neighbours happened to occupy the same seat in the railway carriage. They soon became earnestly engaged in conversation on business, its prospects, their own plans and successes.

The worldly merchant, the elder of the two, said they had been very successful for the year past, and could now say he had a competence. "I do not care," said he, "to be worth any more."

"Well," said his friend, "this life is all provided for. That is all right. But how about the life beyond?"

"Oh," was the reply. "I do not worry myself about that."

"But ought you not to trouble yourself about it?"

"No I think not. I have no doubt that it will be all right."

"But I would not thus trust without looking into the matter. The interests involved are momentous."

The train had reached the station, and the two merchants separated, each taking his way to his own place of business. A few months afterward the Christian merchant missed his neighbor from the morning train. On inquiry he learned that he was sick. Days and weeks passed, and he knew only that his neighbor was unable to be out. At length, as he was in his office in the city one day, he received a telegram that his neighbor was dying and was desirous to see him. He lost no time in hastening to his bedside. There, surprised and delighted, he heard from the lips of the dying man this announcement:—

"I could not die without thanking you, sir, for what you said to me some months since in the railway train. It made an impression on me at the time, and since I have been shut up here it has come up to me again. I am dying, but I trust all beyond. My hope is in Christ."

Was not that a rich reward for one act of Christian fidelity? What opportunities for thus speaking a "word by the way" are constantly occuring, and how glorious would be the results were they improved!

It is not always high water with the saints, sometimes they are reduced to a very low ebb. The best of saints are like the ark tossed up and down with waves, with fears, and doubts; and so it will be till they are quiet in the bosom of Christ.

Seneca well says, that "though death is before the old man's face, yet he may be as near the young man's back." Man's life is the shadow of smoke, the dream of a shadow. One doubts whether to call it a dying life, or a living death.

Man's holiness is now his greatest happiness, and in heaven, man's greatest happiness will be his perfect holiness.

PERSONAL ITEMS.

Dumas the younger honors the memory of his father, one of whose dramas he has reconstructed. He says: "To know the author of the piece is not easy. The public shall decide. If it succeeds, it is my father's; if it fails, it is mine."

Mark Hopkins, the treasurer and brains of the Central Pacific Railroad, who died childless, leaving $15,000,000, wore shabby clothes, dug his own garden, picked up bits of old iron when he saw them, worked until two o'clock in the morning, wrote more on a page than most business men put on sheets, and paid thirty-five dollars a month rent.

A very large land-holder was the Earl of Leitrim, who was shot a few days since by some of his exasperated tenants. He owned 56,184 acres in Donegal, 18,203 in Galway, 53 in Kildare, and 21,179 in Leitrim, making in all 95,619 acres. Of the two Irish dukes, Fitzgerald, Duke of Leinster, owns 70,262 acres in Kildare, and 1,119 in Meath, and Hamilton, Duke of Abercorn, 51,860 in Donegal and 15,919 in Tyrone.

A Washington correspondent who knows all about noses, writes this: "Senator Kernan is said to have a long, practical, sensible nose; Senator Conkling a handsome, lighting nose; Senator Lamar an artistic nose of great possibilities; Senator Howe a long, triangular nose, with a sharp point; Senator Bayard an inquisitive, yet a courteous nose; Senator Edmunds a firm nose, the nose of a gnarled and knotted character; and Senator Barnum a dashing and heedless nose.

The Rev. Jasper, L.L. the Richmond darkey, who preaches dat de sun do move an' de eart' stan' still, is a Baptist, is five feet ten, sinewy, square-shouldered, round-headed, with a retreating, thatchroof forehead, bright eyes, gold spectacles, oval face, big chin, shaggy beard and moustache, short, flat feet, gold shirt buttons, strong, musical voice, and a various amount of grammer. It needs neither much beauty nor much sense to gain notoriety—witness G. F. Train, Count Joannes, and Jasper, and many more nuisances and nincompoops, lay and reverend.

No street in the world represents so much wealth in the short space of two miles as Fifth Avenue in this city, between Washington Square and Central Park. Among the wealthy residents of this reach may be mentioned: Dr. Rhinelander. $3,000,000; M. O. Roberts, $5,000,000; Moses Taylor, $5,000,000; August Belmont, $5,000,000; Robert L. and A. Stuart, $5,000,000; Mrs. Paran Stevens, $2,000,000; Amos R. Eno, $4,000,000; John Jacob and Wm. B. Astor, $60,000,000; Mrs. A. T. Stewart, $50,000,000; Pierre Lorillard, $3,000,000, James Kernochan, $2,000,000; William H. Vanderbilt, $75,000,000; Mrs. Calvert Jones, $2,000,000; James Gordan Bennett, $4,000,000; Frederick Stevens, $10,000,000; Lewis Lorillard, $1,000,000. Total, $248,000,000. Here we have 18 families living near each other who derive fixed yearly incomes from a capital between $240,000,000 and $250,000,000.

Real Estate.

FOR SALE --- FINE DAIRY FARM.

A very fine Dairy Farm of **160** acres, two miles from the city limits of Toledo. In the finest farming section adjacent to the city. 100 acres in Grass, 27 acres of Corn and Oats, 15 acres fine Wheat, 18 acres good Timber. Convenient brick residence, with barn and stable for 40 cows. Abundant supply of pure water that never fails. Three apple orchards. A valuable "milk track," with cows to supply it, if desired. The Farm is on a good road, planked to within ¼ a mile, and is a valuable living for some one. The party now owning the farm has nearly made it *clear* in the past six years, from the proceeds of his dairy. For further particulars, address

CREAMERY BUTTER.

The Cooley System of Butter-Making has been before the public but one year, yet over 1,300 Dairies have introduced it. Read for yourself what people say about it who are using it;

OGDEN FARM, NEWPORT, R. I., March 24, 1878.
VERMONT FARM MACHINE CO.:
Gentlemen:—We are more and more pleased with the Cooley Creamer as we continue to use it, and we feel confident that we shall produce a better quality of butter this summer by means of it than we ever had before. We are now getting $1 a pound for our butter. Very truly yours, MELVILLE BULL.

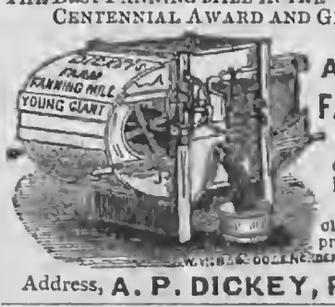
THE BEST FANNING MILL IN THE WORLD. OBTAINED CENTENNIAL AWARD AND GRAND MEDAL.



BUY THE
A. P. DICKEY
FANNING MILL

No good Farmer can afford to market dirty grain.

A medium quality well cleaned brings a better price than the nicest grade in dirty condition.

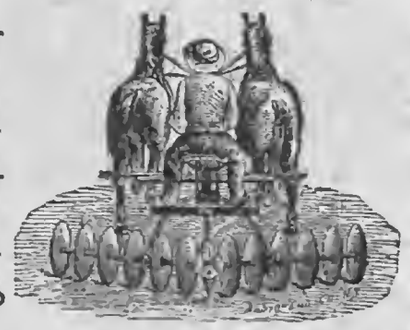
Address, **A. P. DICKEY, Racine, Wis.**

The **THOMAS RAKE** is made for farmers who want a first-class Rake at a comparatively low price. It costs less for repairs, does better work, and is more durable than any any other Rake. It is the standard everywhere. We also make a lower-priced Rake and the best Revolving Rake in the market. Send for Circular. Order from the Factory if your dealer does not keep them. Made by

J. H. THOMAS & SONS, Springfield, Ohio.

LA DOW'S JOINTED
Pulverizing and Smoothing HARROW.

Light, Simple, Cheap. Durable and Flexible.



Will pulverize and leave ground smoother and in better condition and cover seed better, by once going over, than twice with ordinary Harrow. Acknowledged the best in use. Being jointed in the center, it accommodates itself to uneven surfaces, such as dead furrows, ridges, &c. Made with both Chilled Metal and Cast-Steel Discs.

Responsible agents wanted where we have none. Manufactured by **WHEELER & MELICK CO.,** Albany, N. Y., for the United States, except New England States. EVERETT & SMALL, BOSTON, Mass., Manufacturers for the New England States.

THE OLD, RELIABLE

TAYLOR RAKES.

Five Different Styles, including 2-Foot, Hand and Self-Dump.

Taylor's Self-Dumping Rake (No 4) has been greatly improved for 1878. This Rake made a great success last season, and is now the best Self-Dump Rake in the market.

These are the only Rakes ever offered the farming community that have proved a Complete Success, in all kinds of Rakings, in the United States, Canadas, British America, and in Europe and Australia.

Wit and Humor.

SPARKS AND SPLINTERS.

TAKE China, said a homœopath to an ague shaken mortal. And the driviling idiot immediately repaired to his home and devoured a tete-a-tete set. He'll shake no more.

THE Rochester (N. Y.) Express says, "The story is told, and it is said to be entirely true, that at the recent dedication of a Baptist church in this county, the ceremony of immersion was performed for the first time in that church by a well-known Baptist minister of this city. When he had entered the water, and while waiting for the candidate, the minister suggested that somebody should sing an appropriate hymn. One of the deacons who stood near by, heard the suggestion, and, without thinking, struck up the familar hymn, 'Pull for the shore.' The hymn proved to be so suggestive that neither the minister nor congregation could restrain an audible smile for some time, and the cermony had to be postponed until the preacher could recover his gravity."

A Word to Tourists.

You cannot have a better companion on your journey than Hostetter's Stomach Bitters. That prime medicinal agent will enable you to drink brackish water without running the risk of disordered stomach and bowels, will neutralize the influence of foul or miasmatic air, and will prove a most agreeable and wholesome stimulant and means of counteracting the fatigues of traveling and seasickness. Change of climate, water or diet, is apt to induce harassing and often dangerous diseases. The three changes combined are fatal to thousands of emigrants and travelers every year. Is it not, then, of the last importance to know that Hostetter's Stomach Bitters are an absolute preventive of the horrful consequences arising from these causes? Travelers, voyagers and emigrants to new countries cannot be too often reminded of the fact that this agreeable vegetable tonic is the most reliable safeguard against disorders to which they are far more liable than the habitual denizens of healthy regions.

IMPARTIAL.

New Parson (who wishes to know all about his Parishoners.) "Then do I understand you that your Aunt is on your Father's side, or your Mother's?"

Country Lad. "Zometimes one an' zometimes the other, 'ceptin' when Feyther whacks 'em both, Sir!"

STOCKBRIDGE
MANURES

Originated by Prof. Stockbridge, Prof. of Agriculture in the Massachusetts Agricultural College.

Made for each crop, furnishing the plant food which each requires. They have been used for five years with such success that in 1877 they were applied on over 10,000 acres with excellent results. **Send for Pamphlet, Mailed Free.** Also for sale, Agricultural Chemicals.

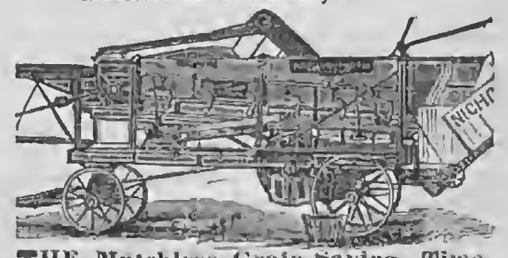
'VIBRATOR'
Reg. March 31, 1874.

THE ORIGINAL & ONLY GENUINE
"Vibrator" Threshers,
WITH IMPROVED
MOUNTED HORSE POWERS,
And Steam Thresher Engines,
Made only by
NICHOLS, SHEPARD & CO.,
BATTLE CREEK, MICH.



THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all Rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

GRAIN Raisers will not Submit to the enormous wastage of Grain & the inferior work done by the other machines, when once posted on the difference.

THE ENTIRE Threshing Expenses (and often 3 to 5 Times that amount) can be made by the Extra Grain SAVED by these Improved Machines.

NO Revolving Shafts Inside the Separator. Entirely free from Beaters, Pickers Riddles, and all such time-wasting and grain-wasting complications. Perfectly adapted to all Kinds and Conditions of Grain, Wet or Dry, Long or Short, Headed or Bound.

NOT only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes no Litterings or Scatterings.

FOUR Sizes of Separators Made, ranging from Six to Twelve Horse size, and two styles of Mounted Horse Powers to match.

STEAM Power Threshers a Specialty. A special size Separator made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, with Valuable Improvements and Distinctive Features, far beyond any other make or kind.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "VIBRATOR" Thresher Outfits are Incomparable.

FOR Particulars, call on our Dealers or write to us for Illustrated Circular, which we mail free.

The Naturalist.

THE TIGER.

WHILE the lion reigns supreme over the feline race in Africa, his claims to undivided sovereignty are disputed in Asia by the tiger, an animal which although less high on the legs and more slender than the African monarch, yet equals him in actual size and strength and excells him in elegance of form, beauty of fur, and grace as well as activity of movement.

In its stealthy carriage, lithe figure, small head, maneless neck, and indeed in its whole appearance, the tiger bears a much closer resemblance than the lion to the domestic cat which serves as a type for the whole genus of *filidæ*. Its handsome coat is of a tawny yellow above, irregularly striped with dark-brown transverse bands almost at right angles with the body and limbs, and fading into white on the under parts, as well as on the chest, throat, around the eyes, on the back of the ears, and on the tufts of long hairs on each side of its jaws. Its long tail, ringed with black, slightly tapering, and extremely pliant, adds not a little to its beauty.

It is exclusively an inhabitant of the continent of Asia and the adjacent islands. It is abundant in Java, Sumatra, and throughout the greater part of Hindostan. It is found also in Siam, China, Bokhara, Southern Siberia, as far north as the banks of the Obi, as well as in the numerous states stretching westward to Persia, and, in 1853, a savage specimen was found by Mr. NORDMANN, wandering as far to the west as Tiflis, in Georgia. In Bengal it attains its greatest development, and is honored with the title of royal.

The favorite site of its lair is on the border of a stream amid the jungles of a densely wooded district. To this den it retires to rest when gorged with abundant food, and from it, when urged by appetite, it steals forth, secretes itself in a wood or behind a clump of shrubbery on the border of a sequestered path, and there, concealed from every eye, awaits its victim. The moment it sees the object of its desire, its eyes flash, its supple tail curves with suppressed exultation, and its whole bearing manifests a savage joy. It allows the unsuspecting prey to advance, and when sufficiently close, with tremendous force and velocity bounds upon it. If it gets wind of its prey from a distance, it glides through the tall grass with the undulating movement of a serpent. Despite its brilliant hues, there is no animal that can hide itself more thoroughly. The markings harmonize so well with the dry, dusky, jungle grass, among which the creature loves to dwell, that the herbage and fur are so nearly undistinguishable that when it is crouching low down, even amid scanty vegetation, its destined victim may almost tread on it without detecting its dangerous presence. Usually it takes up its post opposite its lair, so that it need not turn with its prey but proceed straight to its den with its acquisition. It bounds on its victim from a distance of 15 or 20 feet. A blow from its sledge-like paw, with its sharp sickle-like talons which cut like knives, is enough to strike to the ground a sturdy ox. It first tears open the throat and greedily laps the hot blood, then drags the victim to a secluded spot, watches it until evening, if captured in day-time, and then beginning at the hind-quarters eats towards the head, crunching flesh, skin and bones alike, until gorged so that it cannot eat another mouthful. After having liberally slaked its thirst from a neighboring stream, it then retires to its lair where for three days it lies in a semi-torpid condition, enjoying a grand repast and a healthy digestion, and relieving its craving thirst with an occasional draught of nature's choicest beverage—water. It then returns to the remains of its prey, and without any fastidious scruples, begins another hearty meal, however tainted and malodorous the fare may have become in the interval. Acting on their knowledge of this habit, the natives, whose herds have probably furnished the banquet, frequently follow the track of the destroyer and his burthen, and in the interval between the first and second feast, either poison the carcass or construct, close to it, a scaffold from which a lurking marksman slays the beast on its return to the mess.

The reputation which has made the word tiger, a synonym for savage ferocity, is due in a great measure to the animal's incredible audacity when urged on by the gnawings of an empty stomach. Nor does it delay until the last extremity before displaying a reckless courage in seizing on its prey. Although its usual habit is to creep stealthily towards its victim and spring treacherously on it, yet there are hundreds of instances where the hungry monster has flung himself boldly on the first object that excited his desire, whether it happened to be one of a cavalcade of armed horsemen, a soldier in the midst of an encampment, a Brahma among an admiring crowd, or a peasant among the excitement and multitude of a fair or market. Every year thousands of human beings, men, women and children, fall victims to the cunning, audacity and ferocity of this terrible scourge, until whole districts in India and elsewhere have been depopulated or rendered uninhabitable by its ravages.

In one part of Java lately, 148 persons thus perished in a single year and 131 in the next. A tiger that has once tasted human flesh is said to relish the delicacy so highly that he ever afterwards makes it his special aim to secure it at all hazards, so that the "man-eater" becomes a terror in every neighborhood he infests. An outer change is said to be, ere long, wrought in his appearance, so that he can be distinguished by the darker tint of his coat and a redness in the cornea of the eye.

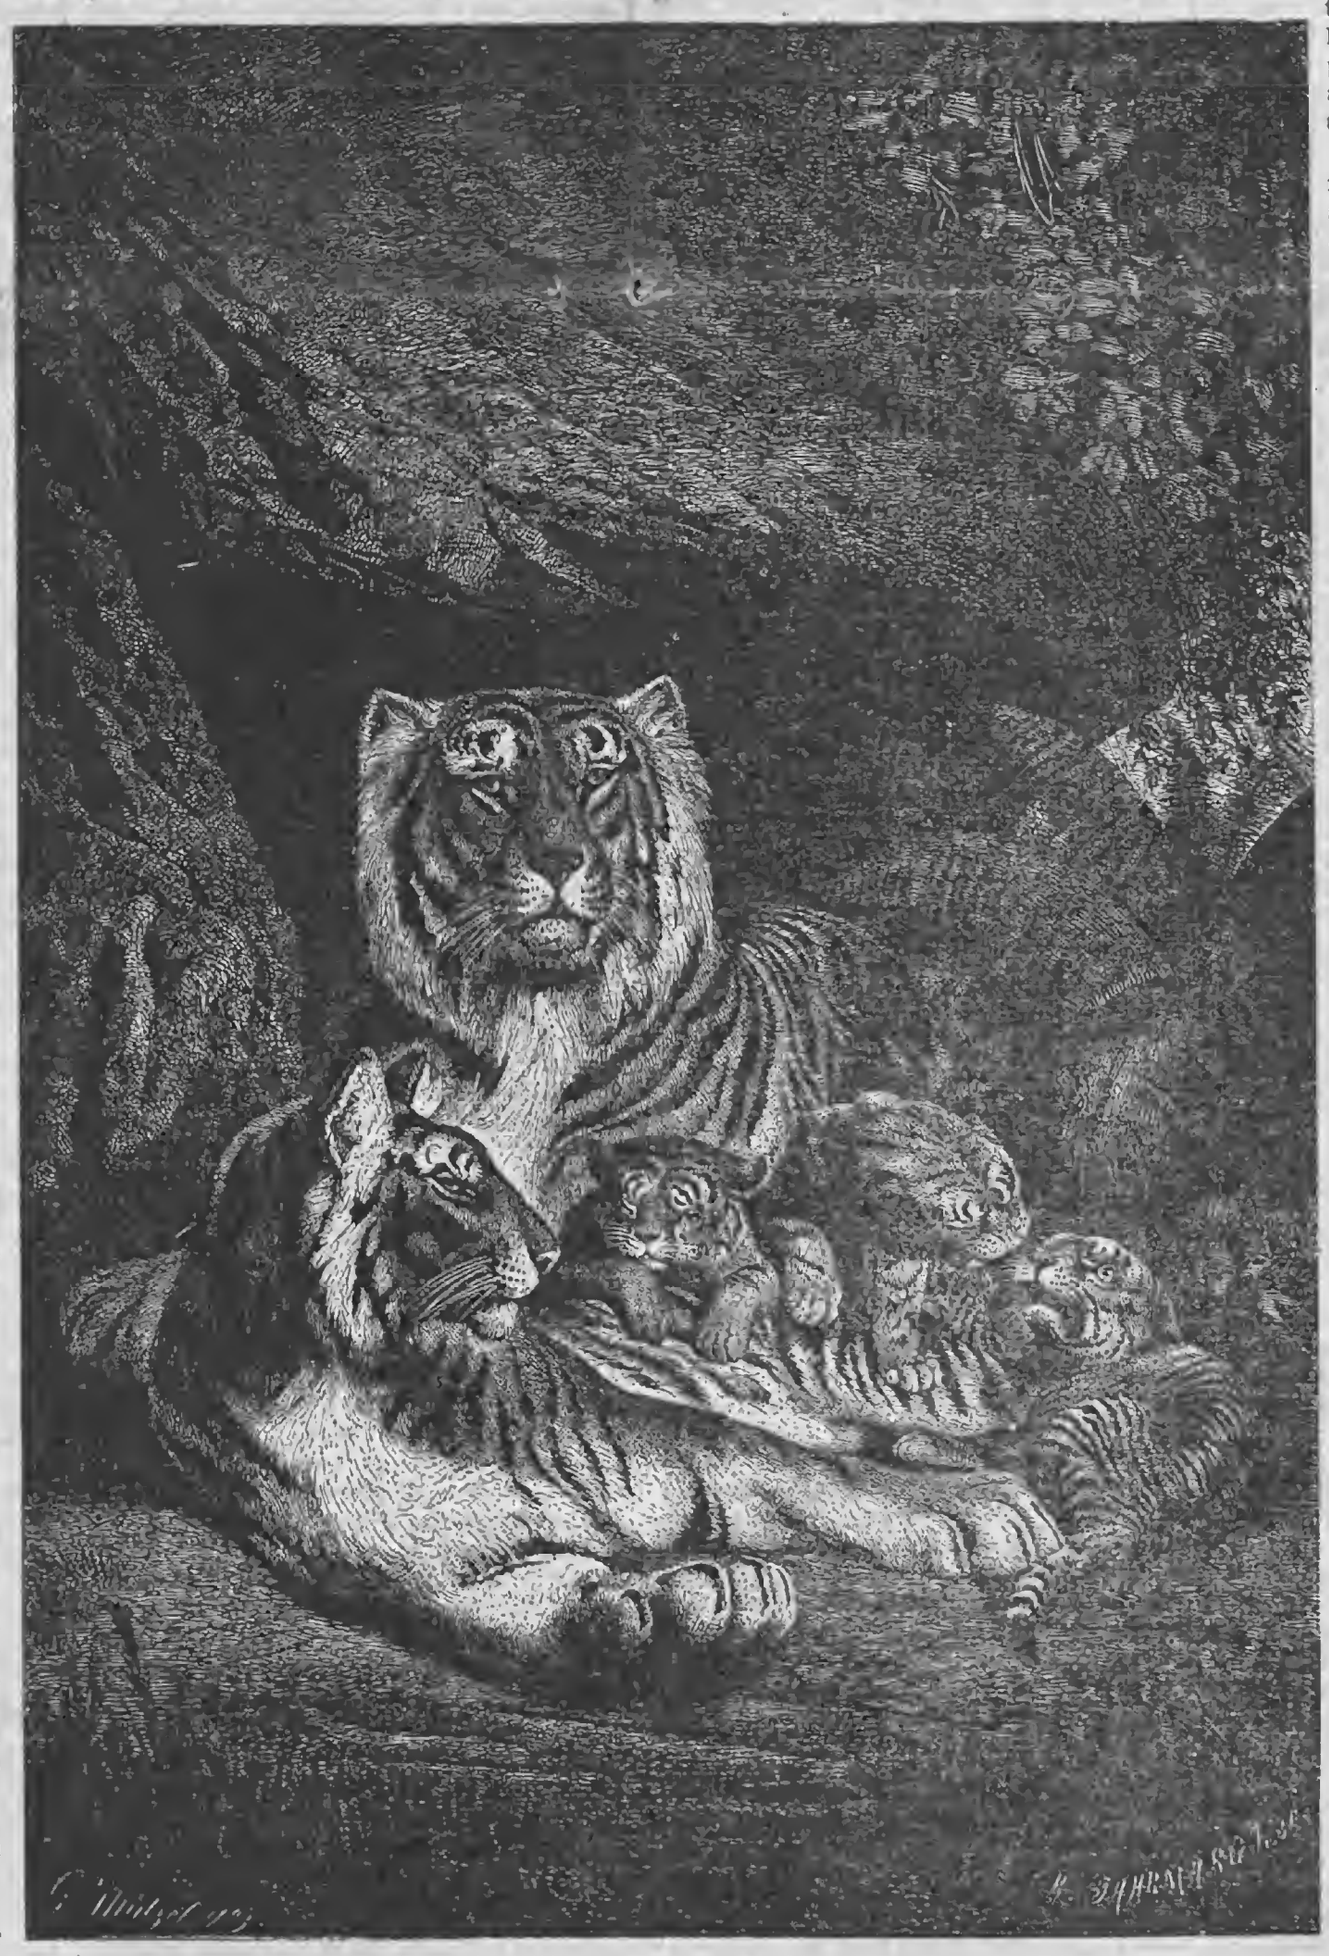
A litter of young tigers is generally composed of from three to five cubs. As the tiger has the habit of devouring all the newly born young of his own sex he can lay his paws on, the tigress, just before dropping her young, searches about for some secret, inaccessible spot where she may in safety give birth to her progeny. Moreover, she is extremely careful to make all her tracks in the neighborhood as intricate and confused as possible. She manifests an extraordinary degree of affection for her offsprings and will defend them from danger often at the peril of her own life. A litter of tiger cubs playing round their couchant dam is not at all unlike one of kittens gamboling about and over their prostrate mother.

The tiger is an excellent swimmer and readily takes to the water in pursuit or search of prey, but as he swims high, he affords a good mark to the hunter. While a slight wound from his claws, owing probably to the shock to the nervous system, is extremely dangerous as a cause of lock-jaw, the tiger himself frequently perishes from what on another animal would be a trifling injury. On him a small wound soon gets tainted, the flesh rapidly yields to putrefaction, and maggots and blow-flies torment him to death.

When captured young and submitted to skillful training the tiger is capable of a good deal of tameness and affection, as all have now-a-days frequent opportunities of witnessing; for the menagerie finds its way into every corner of the land, and at it every youngster can see tigers handled like poodles.

To the ancient inhabitants of Europe the lion was known long, long before the tiger had ever been seen. PLINY tells us that the first ever brought to Rome was in the reign of Augustus. Three-quarters of a century later, Nero's pet tiger was as great a terror to his courtiers as the tyrant himself was to subject humanity. After one of his wild orgies, it was a common practice of his to point out to his attendant brute some Patrician who had incurred his displeasure or at whose expense he wished to create at once amusement and excitement, and straightway the wretch's mangled corpse was laid at the feet of the human monster. About a century and a half later Heliogabalus entered Rome on a chariot drawn by four tigers and as many leopards all of which were afterwards allowed to roam at liberty around the palace of the cruel and voluptuous tyrant. In the East tigers have for ages been the emblems of power, as well as among the sources of its amusement and the objects of its display.

It has been a subject of frequent remark that it seems a trifle inconsistent with the beneficence of the Creator that so many animals have to support life by the destruction of others, all the more painful from the lacerations of their carnivorous destroyers. Some maintain, however, that there is a beneficent provision by which all sense of pain is expelled after the first shock on being seized by a carnivorous animal. Numerous instances to this effect have been cited, especially that of Dr. LIVINGSTONE. On one of his early visits to central Africa, he was flung to the ground by the sudden attack of a lion, and before



A ROYAL FAMILY.

his rescue, had been seized by the shoulder and shaken as a terrier would shake a rat. The shock produced a stupor and a dizziness in which, while conscious of all that was happening, there was neither sense of pain nor feeling of terror. Others, again, assert that Nature is obdurately indifferent to the pains and pleasures of her children, and that this little globe of ours whirls round every day and year, crushing bones as well as hearts with every revolution.

Farm Topics.

ROTATION OF CROPS—SOME BENEFITS OF.

W. H WHITE.

FARMERS occupying a vigin soil, find very little necessity for resorting to any particular mode of fertilizing it, in order to produce good crops; neither do they pay any regard to the laws of rotation, although these are essential, as is found in after experience. For experience teaches that if any one variety or family of crops or plants be constantly taken from the same soil, without making any adequate return, the land, sooner or later, fails to yield a return at all in proportion to the expense of production; whereas when a variation, or rotation, of different crops on this same soil, is practiced, a more satisfactory return is had. In all of our older farming districts the original system of culture is necessarily greatly changed. My memory extends not near as far back as that of many others who may read this, yet it reverts to a time when much of our land was devoted to grain crops of some kind. It was then found that much of the soil would grew fair crops only once in two, three, or more years, without manuring. Accordingly it became necessary that a rest of this duration should be given or at most, in our culture, tho land was only plowed etc., tho farmers adopting tho fallow system, exposing the soil to the influence of air, rain, etc., so that tho action of the elements might assist in pulverizing the soil, and in naturally decomposing the accumulated stores of fertilizers in it, in this way rendering them available as plant-food. Why this failure to produce a crop regularly? To answer this understandingly we need investigate the constitution and requirements of plants, their means of taking up pabulum, and the offices the soil performs in relation thereto.

Plants are composed of different elements, some of which come only from or through the soil. The functions of the soil are to hold or "fix" these elements, elaborate and yield them as food for plants. Some plants require a certain quantity of one element, others need an amount of some different element. These different elements are supposed to be held in the soil, mostly as compounds, and before becoming available to the plant, it becomes necessary that they should be digested, elaborated, in the soil. Now, if the soil becomes deficient in any one element essential to the particular plant grown on it, it is very evident that it cannot supply that element in sufficient quantity to the plant which demands it; neither can it if the plant-food in it be abundant but locked up in combination with other elements; so that that particular plant will fail to thrive on the land, not because the soil is "worn out", but merely because it is deficient in this element properly elaborated. If we take plants of a different class, demanding some other element which is in excess in the soil, we find that such plants will thrive and produce abundantly. The reason, then, why one class of plants fails in a soil in which they have been successively grown, is that such plants have drawn from the soil so much of the elaborated element needed by them as food that enough does not remain to support them in vigorous growth. Such elements may be restored by adding to their amount by the application of manure and fertilizers, but the quantity must be in proportion to the exhaustion. In practice we find that the supply may be economized by some system of variation, whether it be some regular course of different cropping or some less elaborate method. Whether we apply animal manure, plow under green crops, apply mineral or other fertilizers, or depend upon the fertility of the soil alone, we also find that by change we realize much better returns for the labor, time, fertility etc., expended.

Some crops rapidly exhaust fertility by appropriating large quantities of the elements essential to their growth; others either use less, or have the ability to collect their food more readily from a broader area. Some roots remove from the soil in any ordinary crop a comparatively small amount of certain elements which if abundant in an available form, would vastly promote their growth and increase their yield; while straw crops demand an available quantity of elements very different from those needed by grains crops. The growth of one variety of crop in a measure prepares or fits the soil for some other; the rejections or excreted matters thrown off by the first crop enter the soil and form new combinations, which in turn are decomposed, and their elements are frequently the most required for the nutrition of the next. Almost all plants have their enemies growing year after year in the same soil. They increase most abundantly where a single crop is grown, for on coming to the surface each season, they find their most desirable food at hand, and accordingly thrive and multiply rapidly. Frequently the same crops, successively grown in the same soil, will contract disease from some cause often not readily ascertainable. This liability is diminished, if not entirely got rid of, by a rotation.

To realize in crops, the greatest possible benefit from the application of manure, they should succeed each other in the order of their dissimilarity, and consist of as many classes or families of plants as possible, only repeating each class at the greatest convenient distance of time. A rotation something like the following: oil plants, roots, commercial plants grown for the plants themselves or their leaves, leguminous plants, grains and grasses, will illustrate my idea of different classes of plants. It also suggests the variation although this is not given with any particular order as regards the succession. This can best be arranged to conform to differences in soils, localities, markets, &c. The longer the interval between two crops of the same kind, the better the soil is prepared to supply the necessary elements which enter into their structure, it having replenished them from the atmosphere, digestion and matter added otherwise, or having had substances detrimental to the plant dissolved and washed away by the action of the elements. The English agriculturist, by close observation, long experimenting etc., has slowly worked out a system of rotation which is peculiarly adapted to his circumstances of soil, climate and necessities. Our country being so extended, and embracing such a great variety of soil, climate, &c. no single set of crops can be adopted as universally suitable for all places and even if such a course existed, our markets would not afford the requisite demand to absorb the large quantity of the few kinds of similar products and varieties that would be produced.

As a result of the great size of the country and the variety of its climate, soil and demands, the American farmer finds his occupation made more profitable in that he is able to produce a greater variety of crops, thus finding a ready market for all his productions. Another happy result, too, is that as a people we are less dependent upon the resources of other nations than if we had a less diversified soil and climate. There are several crops, however, of which, as a class, our American farmers grow too little, and which, as we advance in the art of agriculture, we shall find advantageous. I here refer more particularly to the leguminous plants, as peas, beans, clover, etc. These plants supply some of the richest and best food for stock, and from feeding it a more enriching quality of manure is made. If we devoted a larger area to the growth of these crops, and adopted a system of rotation of such crops as are particularly adapted to the soil, climate and market of each locality, our farms would improve; we should be able to keep more farm stock; and by feeding these crops to the stock on the farm, an immense amount of the very best quality of manure would be made, which, judiciously applied, would bring still better crops, while at the same time our farms would be increasing in value. Taking this view of the question, would it not seem economic to add to our possessions by improving our system of culture instead of adding more acres to our farms? The thought should be ever uppermost with all cultivators of the soil that the value of their possessions does not consist in the number of acres they own, but in the production economically derived therefrom.

Worcester Co., Mass.

NOTES FROM MAPLEWOOD FARM.

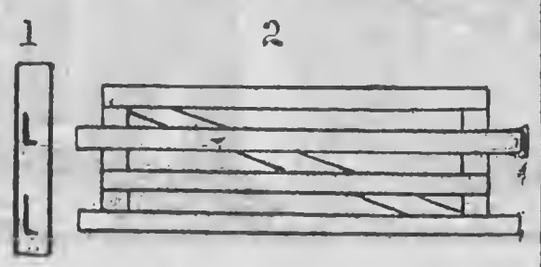
HECTOR BERTRAM.

FENCES AGAIN.

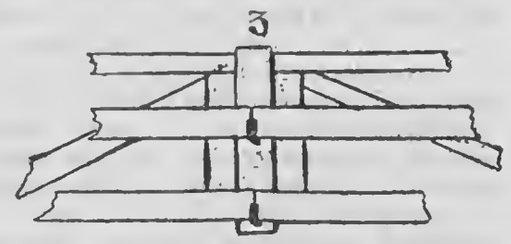
THE subject of fencing is at the present receiving a vast amount of attention from farmers generally. Considering the cost of material, building, and repairs, it is really one of the most important features of the farm account-book, and while I cannot accept the fact advanced by many, that fences on the farm are a nuisance, an unnecessary cause of expense, I am confident the enormous outlay for fencing now made every year, may be greatly diminished by a more judicious selection of material, a simpler style of building, and more care in their disposition on the farm. We must have fences on the farm. It is not sufficient that one or two fields are fenced for stock. Stock, especially sheep, require frequent changes of pasturage. We cannot use one or two fields for stock range for an indefinite period with good results. The second or third year after seeding, the land affords the most pasturage. After this the quantity and quality deteriorate. Therefore it is impossible to simply fence a small portion for this purpose. If we do, we must change the fences repeatedly, making fully as much expense as would arise from fencing the whole farm.

There is no improvement made which adds so much to the appearance of a farm as the fencing—good substantial fences kept in repair. A great amount of fencing is unwise. An indiscriminate mixture of stone, rail, stump and board is untidy. A farm well fenced in large fields with either stone or board and with a substantial fence along the highway flanked by a row of shade trees, is the one I should select in preference to the one that has been thrown open to the street for the free access of any cattle that may by chance break into the highway, or be driven past.

For the benefit of those who think with me that fences are not a nuisance, but one of the



chief requisites of the model farm, I present a plan of a cheap, durable, neat and handy fence. By reference to the cuts, it will be seen that any pannel of this fence can be taken out at any time to afford passage for a load of grain or hay, without being obliged to drive the whole length of the field to gain a gate or bar-way. Along roads where the snow drifts in winter, they are easily taken down and piled out of the way until spring. Fig. 1 represents the post with hooks



driven in; Fig. 2 a pannel of fence; and Fig. 3 a section set up.

As far as expense is concerned, the above fence can be built for about the same as the common style of board fence, and is, I think much handier and neater. The pannels should be about twelve feet long. It would perhaps be better to allow the first and third boards to project instead of the ones shown in the cut.

I have been making a garden or trying to rather; for there has been so much rain that the ground is like a mortar bed. Onions, peas, beans, potatoes, radishes and corn are up. Onion seed sown without sprouting, came up in less than two weeks. Onion beds should be covered with ashes. I have found these an excellent dressing. In fact, I know of no vegetable that ashes are not good for.

Some one asks for a preventive for the depredations of ants: A few stalks of tanzy, laid about the buttery shelves, will drive them away entirely.

Field Crops.

THE POTATO PROSPECT.

WM. J. FOWLER.

IT is a wonder to me, as it may well be to any one, that shrewd, intelligent farmers are preparing to plant largely of potatoes, while with every furrow they turn there are hundreds of lively potato beetles, to say nothing of myriads more already above ground and patiently waiting for potatoes to appear so that they can begin operations. Yet this is just what is daily done in this section. Some farmers of my acquaintance propose to plant ten or twenty acres. One large farmer intends to put in thirty-five acres. "Enough," as he says, "to give the beetles more than they can eat," and thus save his crop. Of course, this expectation is fallacious. The more potatoes planted and not strictly watched, the more beetles, and after the posts have destroyed the crop, they turn to neighboring fields to repeat their ravages. Last year the farmer above spoken of, grew several acres, which he never dug, and if he plants thirty-five acres this season, it means trouble for his neighbors as well as for himself.

My belief is that hundreds, and probably thousands of acres of potatoes will this year be abandoned and plowed up as fallow for wheat. In no previous season in Western New York have the potato beetles been so numerous thus early in the season. They were abundant last fall and few apparently have died. This fact is preventing judicious farmers from planting as largely as usual. On the whole, fewer potatoes will be planted in this section than in four or five years. A small planting, well cared for, will pretty surely pay. It is better to plant only on rich, moist soil so as to insure a large yield; and be careful to have enough help at the right time. No matter what mode of destruction is used, the enemy must be disposed of promptly or the crop is lost.

And yet there are localities where considerable planting of potatoes may be advisable. The potato beetle runs in neighborhoods, enough anywhere, but some farms are more infested than others. I propose to plant several acres, for the reason that I am in a neighborhood where few potatoes were grown last season. Potato beetles do not travel far. In the spring they fly till they find a potato plant, and in most sections they don't need to go far. My potatoes will be planted rather late, about the last days of May, so that the beetles that have wintered over will mostly have found homes. I expect a good many; but here the idea is true that on a large field they are at first less destructive than in a small patch. I think the beetles have some way of finding out where young potatoes are growing; but if so they are as likely to be attracted to a small field as to a large one. [Plant a single potato where you will—in the remotest, most hidden part of the field or garden—the beetles will find it without any trouble. In our own grounds they prefer the Matrimony Vines to those of the potato. Perhaps it would be well to plant a *quantum sufficit* of this rampageous vine (plant) around the potato patch.—EDS] The difference is that in a large field they seem less numerous, and are not destroyed so soon. Spend the same number of days' work per acre on a large field and it will be freest from the beetles and larvæ.

We are gradually learning how to deal with this enemy, and "knowledge is power!" To those who know how, the cost of fighting the potato beetle need not exceed $5 per acre. If the land is rich enough to yield 200 bushels per acre, the extra cost of potatoes because of the beetle will be only two and a-half cents per bushel. If you plant early varieties which yield lighter crops, the expense per acre will be somewhat less, but there will be an increased cost per bushel.

EXHIBITING VEGETABLES AT FAIRS.

PROFESSOR W. J. BEAL.

IT is now none too soon to begin to prepare to make a good display at the various annual exhibitions which are to occur in autumn.

In the first place: the person ambitious for fame or prizes will strive to raise excellent samples of the vegetables which he intends to exhibit. He will take all precautions to have the soil well prepared and to select the proper soil for each vegetable, and then give extra care in cultivation, and thinning, and the supply of water. In some cases liquid manure will be employed once in a week or two. Enough of each sort will be raised from which to make good selections. As a general rule for vegetables, great size is not of most importance; samples will always look best if they are of uniform size, shape and color. It will often be best to reject one or two of the largest that the rest may look alike. If shown at all, the larger uneven samples may be put in a separate place. To be worthy of a prize, they should be tender, of good flavor and quality.

In sending to the fair, great care should be taken in preparing the samples to have them fresh, sound and clean. Some kinds are best placed on wet sphagnum or grown in neat uniform pots or boxes in which they may be shown in good condition.

With regard to the quality of roots for feeding stock, Mr. JOSEPH HARRIS makes the following comment in his address at the Centennial Exhibition. "The English seed-growers have for years bred turnips and mangels for size and shape, until they can grow 84 tons per acre, nearly 80 tons of which is water. Now in this country we do not wish to pull up, top, draw home, pit and slice up 80 tons of water to get 4 tons of food. We can pump water far more cheaply with a wind-mill. Turnips and mangels will never be generally grown in this country till we begin to breed for quality rather than for size. When we can get mangels that contain but little more water than fresh grass or fresh clover, we shall then be able to gather, store away, cut and feed out the crop at one-third the expense, and the roots would keep better. As long as we are caught by size and sound, we shall find little profit in root culture." In his opinion, even for feeding stock, the matter of quality is worth careful attention.

At our fairs, it is very important to have a good light on the samples exhibited. A skylight is the best; a light coming in over and back or beyond the collection, is the worst. No one enjoys facing a glaring light while viewing a collection. Rather low flat tables present the best surface upon which to exhibit. The good effect produced by vegetables may be much increased by arranging each variety in parallel rows, in squares, circles, ovals, or stars or in almost any compact, symmetrical figures. Much taste may be displayed in arranging these groups to show the contrast of shape and colors in the different vegetables or the surface on which they are placed. Enough of each sort, and no more, should be used to carry out the design. The collection of each person, town, or county in competition should be neatly, plainly and conspicuously labeled, by placing the name of the exhibitor over it. Each variety

should have a label attached to it or fastened where it may be seen. This should be placed on, or just back of or in front of, the specimens. These cards should be attached to the plates by some kind of clasp to prevent visitors or the wind from removing them.

Specimens are generally best shown on a flat surface and not piled on each other. The neat white plates adopted by the Massachusetts Horticultural Society are excellent for this purpose. They vary in size to suit the size of the samples. The plates are in the form of a parallelogram with a very slightly raised edge. Each plate is intended to hold twelve specimens of apples, potatoes, etc. Collections should be distinctly separated by neat boundaries of some kind, to make it easy for visitors and judges to distinguish them from each other without asking questions. This can be done by stems and leaves of asparagus, evergreens, or strips of red, blue, or white paper.

For convenience in judging vegetables, the lots in each class should be as near each other as possible. Competent judges will not trust to the eye alone in determining the merits of vegetables and fruits. They will not be misled by overgrowth, but will consider those best which a person of good taste would select for his own table. Very often something can be told of the quality by cutting and tasting in a raw state, but in case of potatoes, turnips, squashes etc. samples should be well cooked for comparison.

Agricultural College, Lansing, Mich.

THE WOOLEN INTERESTS.

It seems to be folly to sweep away the wholesome protection which the tariff now affords to the woolen interests for both the wool-grower and the manufacturer of woolen fabrics. As is well known to the readers of the RURAL the present tariff is the result of a patient and careful conference between those interested, and it has met with universal approbation, and under its fostering care the woolen interests of America have prospered. It is the specific duty on wool, of ten and twelve cents a pound, which really affords the protection to the wool-growers, and that duty the tariff bill now before Congress proposes to do away with and have only a nominal *ad valorem* duty, which would reduce the protection more than three-fourths. The sheep industry of this country cannot stand any such legislation and we trust Congress will kill this part of the bill, at least. Every citizen is interested in the maintenance of the present prosperity in the woolen interest. Other avenues of business are well crowded and would be damaged by the addition to their ranks of those engaged in the various avocations connected with wool in its different forms, its production and manufacture. The government is an interested party; for it has millions of acres of land to sell adapted for nothing else but sheep and cattle growing, and the more people who occupy these regions, the more there will be to help bear the burden of the national debt.

The manufacturers and wool-growers were in session during the latter part of winter in Washington and agreed to a new schedule of tariff rates, which would be satisfactory and which was all the reduction they thought they could stand and keep the flocks from being sacrificed and the mills from destruction. They, however, were clearly of the opinion that no change whatever ought to be made, but prepared a new basis for a change, if one *must* be made. The Committee of Ways and Means paid no attention whatever to these suggestions, but arbitrarily struck the life out of wool-growing, so far as their action was concerned.

We trust that Congress will not thus deal with this great interest, but heed the voice of warning and be guided by the suggestions of those who thoroughly understand the matter, and who have taken so much pains to harmonize all of the conflicting interests involved, by mutual concessions, and by making as many sacrifices as ought in reason to be demanded. We were never clothed so cheaply as now, which shows that the margins in the woolen trade are at the lowest point. Every citizen is interested more or less in this great underlying industry.

REPORT of the Secretary of the Iowa State Agricultural Society for the year 1877. JOHN R. SHAFFER, Fairfield, Jefferson County, Secretary.

WESTERN NEW YORK HORTICULTURAL SOCIETY. Proceedings of the twenty-third annual meeting held at Rochester, Jan. 1878. The work is made up of a valuable collection of essays by distinguished men.

A TREATISE on Potato Culture, by WILLIAM HUNT. Published by the Quinnipiac Fertilizer Co., New Haven, Conn. This gives the results of an intelligent farmer's experience, and is of value to all who cultivate the potato.

ILLINOIS INDUSTRIAL UNIVERSITY, Urbana, Champaign Co., Ill. The total number of students for 1877–78 is 404. The aim of this University is to teach such branches of learning as are related to agriculture and the mechanic arts, without excluding other scientific and classical studies, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life.

Floricultural.

HANDSOME FLOWERING SHRUBS.

WILLIAM FALCONER.

(Concluded.)

Azalea viscosa comes into blossom about the middle of June and continues more or less in good condition till well into July. Rhododendron punctatum, a very pretty Southern species which sometimes gets considerably winter-killed so far north as this, bears its rose-colored blossoms very plentifully from about the middle to the end of June; but scarcely has its beauty faded when R. maximum, a larger and more showy native species, steps forward and remains with us throughout July. June is, too, the season of perfection of the Catawbiense and many lovely kinds of garden Rhododendrons, for which we are indebted to the horticultural art.

Kerrias, single and double, begin blossoming in May and continue throughout the summer more or less to display their yellow flowers; and from the end of May till the end of June is the heyday of the Mock-oranges or Syringas, as they are often called. From early June till the end of July the Common and Oriental Bladder Sennas, with yellow and saffron blossoms respectively, are in perfection and their profusion of pea-blossoms, lively foliage, inflated bladders, neat habit and hardiness, render them desirable shrubs. In June, too, every branchlet of Cytisus capitatus is terminated by a lot of downy-yellow pea-blossoms; and the Carolina Allspice is decorated with its fragrant dark purple flowers that continue to be produced throughout the summer. The Burning Bush, — Euonymus atropurpureus — bears myriads of tiny dark-purple blossoms in the latter half of June, and these are followed by a brilliant display of red fruit in the fall, which is shown off to excellent advantage in front of an evergreen back-ground, as for instance a belt or hedge of Norway Spruces. Itea Virginica, from the tiniest morsel of a plant to large shrubs, bears its pretty racemes of white flowers from about June 20th to the middle of July. Magnolia glauca, the Sweet Bay of our swamps, is a handsome shrub or small tree that produces fine, globular, creamy-white, fragrant blossoms from the middle of June till near the middle of July; and about the same in season are our Catalpa trees which, either as arboreal or minor specimens, display their beauty long and lavishly. The American species is much handsomer than the Japanese.

The misty panicles of the Smoke Tree are beautifully expanded about the 20th of June and remain in perfection throughout July, but after that I think the smoke is more a disadvantage than a gain. Rose Acacias are shrubs of June; still straggling clusters are occasionally borne throughout the summer.

Hydrangea arborescens and radiata have large flat cymose heads of greenish-white flowers in July, and the silvery lining of the radiata leaves makes them quite ornamental. In early July appear the erect, slender panicles of bluish flowers of Cladrastis Amurensis, and about the middle of the same month the long, erect, raceme-like panicles of white flowers of Æsculus parviflora are quite telling in large gardens, but, of course, it is not condensed enough for small plots. In July, too, the Trumpet Vine makes great show, and Yucca filamentosa—though not a shrub but an admirable substitute—sends forth its immense branched flower-stems. From July far into August the White Alder, Clethra alnifolia, is laden with racemes of small, fragrant, white flowers; and C. acuminata, of equal season, has larger but fewer racemes. Both are desirable garden plants. Of the same season as the Clethras is Oxydendrum arboreum, a Southern shrub or small tree that has numerous pretty white flowers arranged in one-sided racemes clustered in loose panicles, and its leaves too are among the most beautiful of autumn-tinted foliage.

From the middle of July all through August, we have likewise the Vitex incisa in bloom; its bluish flowers are most abundantly produced, and the cut pinnatifid leaves are no small ornament. Though annually winter-killed a little, it seems to enjoy the knife and every young shoot blossoms. From early August into September is the season of our shrubby Althæas—Hibiscus Syriacus—whose showy flowers, single and double, present almost every shade of white, purple, and rose. The roots but not the stems of the Lemon-scented Verbena are hardy here, but as summer approaches, new shoots are made and they bloom from August into September. The branchlets of Callicarpa gracilis reveal some modest little flowers about the 20th of July and keep increasing them more and more till fall, when blossoms bedeck the branchlet points and amethyst berries the lower portions; indeed they are only at their prettiest when November or December frosts nip their beauty.

Hydrangea paniculata, among shrubs, is the lion of autumn, and we find young plants produce larger flower-heads than do old ones, and the same superiority is visible in specimens that have been cut hard-back over those only shortened in a little. The greenish panicles appear early in August, become white from the middle to the 20th of the month, and attain their purplish hue as September advances.

Many miscellaneous blossoms are produced throughout the fall months, which added to the conspicuously decorative fruits of several bushes, as Crataeguses, Snowberries, Bitter-sweet, Winterberry, Burning Bush, Strawberry Bush, Rose hips, Sumachs, &c., and the brilliantly tinted leaves of many of our American and Eastern Asiatic shrubs and trees, give to the fall a mature richness entirely its own. And the last flower of the year is perhaps the yellow blossoms of the Witch-Hazel, that are unfolded in late fall when the leaves are turning and dropping.

But I have omitted a few very pretty little shrubby plants that are better suited for edging shrubbery borders than for mixing with stronger growers: Erica carnea, the European Heath, which from March till May is laden with rose-purple bells; E. vagans, the Cornish Heath, which is in blossom in July and August: Calluna vulgaris, the European Heather, in July; and Daphne Cneorum, a very pretty low-growing evergreen that bears a profusion of terminal clusters of rose-pink flowers in April and May, and again a light second crop in fall.

Now that I have finished I begin to realize the army of favorites I have overlooked, as the host of Spiræas that keep up a succession all summer long; the Snow-drop tree and Cornus florida that bloom in May; the many ornamental Primroses and Pyruses, Berberis, deciduous and evergreen; B. Thunbergii is a beautiful species, that leaves out and blossoms earlier than most kinds, has the most brilliantly colored fruits of any species with which I am acquainted, and moreover, the hues of gold and crimson that appear in its leaves in autumn give it a place in the front ranks of that class of ornamental shrubs, and it is perfectly hardy; Tamarix, whose wythe-like stems are clad with tiny purple racemes in early May; Viburnums, as the Guelder Rose, Rhodotypus, and several others.

Botanical Gardens, Cambridge, Mass.

FLOWERING PLANTS FOR ROOMS.

JAMES TAPLIN.

Many of my lady friends are very successful in growing and flowering plants in rooms, while others say they have no luck with their plants, the want of it being due either to lack of attention, or unsuitable position or atmosphere for growing the plants.

I have no doubt if it came to the growing and flowering of plants in rooms, many of the lady readers of the RURAL would do it far better than I should on the first trial, as the conditions are very different to greenhouse treatment, so I shall only call attention to a few useful plants suitable for the above purpose, with a few general hints as regards cultivation, while advising growers not to attempt growing too many sorts, but to confine themselves to a few well-grown plants which they have found to succeed best under their own particular circumstances. I may also mention that unless there is a special plant-stand furnished with a pan for catching water when plants are watered, it is necessary to place saucers under pots, not for holding water, but to prevent it running on the floor, for few plants will keep in good health if constantly standing in water.

ROSES are generally desired for flowering in rooms, and I have seen some growers very successful with these plants; but many fail from not commencing with good, established plants, or often from having nice plants in flower from a forcing-house. The so-called Monthly Roses, which include the China and Tea varieties, are the only varieties suitable for growing in rooms, and should be grown in pots at least a year before brought into the house.

The green fly is often troublesome on the young growth, but can be easily killed by dipping in tobacco or quassia water, and mildew must be destroyed by dusting with sulphur.

CALLA LILIES. I recollect these as window plants when I was a boy, and they are more popular now than at that time. This is one of the few plants which, when in full growth, can stand in a pan full of water. I have complaints from visitors that their Callas grow well, but do not flower. To these I would recommend standing the plants outside in the full sun, from May until September, and then shaking away all the soil and repotting in good, rich soil.

GERANIUMS. Under this head, I shall include both scarlet and the so-called Lady Washington varieties, although they require rather different treatment. The scarlet varieties are best grown from cuttings rooted in the spring and grown in pots outside during the summer, and will usually flower freely in a light, warm room during winter. Old plants are worth nothing for this purpose, although useful for planting outside in the summer. The Lady Washington class can be either grown as young plants or the old ones cut down after flowering. In dry, droughty rooms, the green fly is often troublesome on them, but can be destroyed by tobacco.

CARNATIONS.—These are best obtained from some florist early in the fall, before the plants have been grown in a warm house, and will, with fair treatment, generally flower all the winter.

BOUVARDIA.—The above remarks will apply to these, excepting that the flowering season does not usually extend much beyond Christmas.

MIGNONETTE.—A few pots of this sown outside in September, are very desirable to flower in-doors when the ground is covered with snow. The same remark applies to the old-fashioned Musk plant, which will grow freely if well supplied with water, and other charming plants of which the ladies never get tired, for example, the Forget-me-not. This can be planted outside in April, and will flower all the summer in a damp, shady place. I saw some charming beds of it in the neighborhood of New York recently.

VIOLETS can be successfully grown in pots, by taking up plants, when planted out in the spring, and bringing them in-doors before frost.

FUCHSIAS are useful plants for house decoration, as they do better in partial shade, and strike freely from cuttings, or if plants are required in flower at once, these are cheap to purchase. Bulbs, such as Hyacinths, Crocuses and Tulips, are best obtained fresh each year, or they can be planted out for one year and taken up for flowering the next. These are among the most useful plants for winter blooming, for if potted early, some can be had in flower by Christmas, and a succession of flowers may be kept up until May by bringing in a few plants at a time. I object to Narcissus flowers in a room, as they are, like Tuberoses and Lilies, of too powerful scent to be pleasant, but, of course, these flowers are nice out-of-doors.

I am often asked if various flowers will do well in a room; for this reason I often try plants not generally grown, among them the Anthurium Scherzerianum or Flamingo plant. One of these I placed in my room six weeks ago, and the plant looks about the same as at first; the flowers which were expanded, are still perfect and others have opened, and it looks likely to stay in flower for six weeks longer. I may say that we do not burn gas, do not keep rooms very hot, and ventilate at all times.

A Brooklyn lady informed me she had her window filled with Thomas Hogg Hydrangea at Easter, and how much it was admired! She had a greenhouse, however, and the plants were, no doubt, in flower before placed in the window, but these plants can be kept in the cellar and would then flower well later in the season.

I may add, it is well to bring plants into rooms before too far advanced in flower. They last much longer. It is also well not to bring them from a very close, moist, hot-house, for in the best regulated rooms there is always a dry air in winter.

South Amboy, N. J.

Arboricultural.

TWO NEW JAPAN QUINCES.

SAMUEL PARSONS.

This species of shrub possesses many qualities which well fit it for frequent use in lawn planting. We have known it so long and become so accustomed to its presence everywhere that we hardly realize the superior advantages it undoubtedly offers for every purpose required of a flowering shrub. Hardy, compact and vigorous of growth, its bright glossy leaves and numerous, richly-colored flowers, clinging closely to the stem, would certainly call forth rapturous expressions of delight were they presented as a new introduction from foreign countries. As it is, every one enjoys the early beauty of the glowing flowers formed before the leaves are developed, and no group of deciduous shrubs that pretends to offer a series of blooms extending throughout the spring and summer, can dispense with its rich colors.

The Japan Quince is a large-growing shrub, and hence should occupy positions in the center or rear of the mass, unless some prominent point of peculiar character requires a larger growth than is ordinarily used. It should be set out early, although on the whole it is quite easy to transplant. Years ago it was considered somewhat difficult to propagate, but now it is grown readily from root cuttings. As already intimated, the foliage constitutes one of its great charms, and a thorny habit has caused its successful employment for ornamental and impassable hedges. To sum up its advantages, it has nearly everything necessary to the character of a perfectly hardy, deciduous flowering shrub. Although the general appearance of the foliage of the Japan Quince in its many varieties, is much the same, the color, size and shape of its blossoms form a very distinctive peculiarity. Distinguished chiefly by the appearance of the flowers, there are at least a dozen varieties common in nurseries. Their colors range all the way from scarlet or crimson

to white, with some varieties striped in a very attractive manner. The red and white are, of course, most popular because most distinct. Almost the only accusation that can be justly made against the Japan Quince is that it grows too large for some positions. My object, however, in calling attention to the Japan Quince, is not only to offer a brief tribute to its many choice qualities, but to describe two distinct varieties that are really very fine and quite unknown to the lawns of America. They come from Mr. THOS. HOGG, as do so many other good things, and have now attained a size which very fairly indicates their nature at maturity.

The first is a strong-growing kind, with leaves of a more oval form than usual and very large flowers of white, touched on the upper edge with rose color. The flowers are well formed and clustered in the usual way about the stem. Their size is very striking, and the habit of the entire shrub decidedly attractive. It will undoubtedly be found a great improvement and addition to the present list of Japan Quince varieties.

The other—Cydonia or Pyrus Japonica, anglicized, Japan Quince—is still more remarkable than the last. I have already noticed that for some positions the heretofore known varieties of Japan Quince were too large. Nature has apparently become cognizant of the fact, and therefore has sent us from Japan this little gem of the species. Dwarf enough to occupy any position near the house where small plants would be used, it has, in addition, literally masses of pretty salmon-colored flowers and a most lovely variegation of the leaves in red, white, and green. The flowers rest like a rich crown on the compact little plant. It may be readily seen how charmingly adapted such a plant would be to a group of low choice shrubs near the house, a place from which the common Japan Quince is perforce excluded. The great value of the introduction of such new deciduous shrubs lies in the increased beauty and variety of foliage and flower afforded at a particular season by groups arranged for continuous blooming. It is not easy to speak too strongly of the importance of deciduous shrubs on a lawn, and it is to increase the list of materials to be combined by the landscape gardener that it affords a pleasure to present two new Japan Quinces for consideration.

Entomological.

THE CURRANT-WORM SAW-FLY.

WILL the RURAL please give the name, origin and habits of the insect, specimens of which are inclosed. LYDIA M. PRATT.

Marion Co. Indiana.

ANSWER BY B. PICKMAN MANN.

THE specimens, very nicely put up, arrived in excellent order, a condition rare enough in the experience of entomological writers, to call for notice and commendation.

The insects are four males and one female of the imported Currant-worm Saw-fly, Nematus ventricosus. They were introduced into the United States nearly twenty years ago, from Europe, appearing first in the neighborhood of Rochester, N. Y whither they came probably in cocoons attached to the roots of imported currant or gooseberry bushes. Had the importers been entomologists, or had they kept in their employ an entomologist, they would have taken into consideration what insects, in what condition, might be expected to occur on imported bushes, and would have searched, in turn, for each of these. They spread in all directions from Rochester, and reached Indianapolis about 1870 Perhaps they were independently introduced into some other places, for instance into Vermont.

The larvæ or "worms" eat only the leaves of the cultivated Currant and Gooseberry, preferably the former. Imagos come out of the ground soon after the leaves of bushes put forth in the spring, and the female soon after lays her eggs. These specimens from Indiana are nearly three weeks earlier than any of which I had record previously. I hope Miss PRATT will make a note of the dates at which the insects pass through their several stages, and send them to the RURAL NEW YORKER to be printed. In about two months after the first appearance a second brood makes its appearance.

The presence of the insects may be noticed in the first stage, after the imagos have been found, by turning up the leaves, or lying down and looking up under them, and seeing rows of white eggs upon the ribs of the leaves. In the next stage the eggs have hatched and the larvæ have gnawed little holes through the leaf, so that it looks as if riddled with shot. When the native leaf is all eaten the larvæ move to other leaves, scattering along the branch, and devouring these leaves from the edge inwards, not riddling them with holes. Soon the branches are stripped. The bushes should be examined frequently, and the larvæ destroyed.

The most certain, economical and safe way of destroying the larvæ is to pick them off, either separate from the leaf or with the leaf, and to destroy them by crushing. They are not poisonous, and are best crushed in the naked hand as they are picked. Some persons, who have a fancy for giving and taking medicine, dust the larvæ with powdered hellebore. This is effectual, if applied often enough and of good quality. Other persons use other powders, especially just as the larvæ have reached their full growth and are about to descend to the earth; as the larvæ disappear about at this time these persons write to their agricultural paper that they have discovered a remedy for the currant-worm.

The male and female imagos are described in detail and are figured in the American Entomologist, vol. 2, p. 16–17. The larva is green, and in its earlier stages has a black head and has many black dots on its body, but after its last change of larva skin, it is grass-green all over, except the large dark eye-spots on each side of the head, and except that the joint next to the head and the hindmost two joints remain of a yellow color. When full-grown it is about eighteen millimeters long. It may be distinguished from other larvæ found on these bushes by having twenty feet, as well as by its other characteristics. A detailed description is given in the Practical Entomologist, vol. 1. p. 120.

The cocoon is thin, oval, six to eight millimeters long, and made of brown silk. It is spun amongst the rubbish on, or slightly under, ground or spun between some leaves on the branches.

This insect is one of the worst enemies which the currant-bushes now have in the country, and should be vigorously opposed wherever it appears. The second generation in the year would be fifty fold more numerous than the first, were it not for enemies, diseases and other mishaps which occur. The increase at any rate is so great that it is well worth while to be thorough in early work.

Scientific and Useful.

MANUFACTURING POTATO STARCH.

P. M., North Jackson, Susq. Co., Pa., wishes to be told how potato starch is made on a large scale, as there are hundreds of bushels of potatoes going to waste in that county, and starch might be made from them and sold for something.

ANS.—A carefnl comparison of a dozen or more tables of analyses of potatoes shows large variations in the proportion of starch in different samples, and that these variations are chiefly caused by the variety cultivated, by the soil and locality in which the tubers are grown, and by the time during which they are kept. The highest proportion of starch in potatoes may be taken at 20 per cent., the lowest at 10 per cent., and the average at 15 per cent. in the natural, and 60 per cent. in the dry state. On keeping, the proportion of starch diminishes, shrinking in one variety analyzed every month, from 17.2 per cent. in October to 14.5 per cent. in the following April.

In manufacturing the article in large quantities, the potatoes are first washed in a cylindrical cage formed of wooden spars, made to revolve on a horizontal axis in a trough filled with water to the level of the axis They are then reduced to a pulp by a rasping machine composed of a wooden drum covered with sheet-iron, roughened outside with numerous prominences, made by punching out holes from the opposite side. It is turned by hand by means of a winch fixed upon each end of the shaft. The drum is inclosed in a square, wooden box, to prevent the potato-mash from being scattered about. A hopper, from which to feed the washed potatoes, is attached to the top of the box, and has its bottom concentric with the rasp-drnm and nearly in contact with it. A pulp chest, underneath the drum, is made to slide out, so as when full to be readily replaced by another. Two boards, slanting towards each other from the opposite sides of the box under the drum, conduct the pulp into it. A moderate stream of water should be made to play into the hopper upon the potatoes to prevent the snrface of the rasp from getting foul with fibrous matter. Two men, with one for a relay, will rasp, with such a machine, from two and a half to three tons of potatoes in twelve hours.

The potato pulp must be elutriated, or cleansed, upon a fine wire—say No. 120—or hair sieve, which is set upon a frame in the mouth of a large vat, while water is made to flow upon it from a spout with many jets. The pulp meanwhile must be stirred and kneaded by the hand or by a mechanical brush-agitator, till almost nothing but fibrous particles are left upon the sieve. These, however, retain about five per cent. of starch which cannot be separated in this way.

This parenchyma, or agglomerated, sticky mass, should therefore be snbjected to a separate rasping upon another roughened cylinder. The water, turbid with starch, is allowed to settle some time in a large tub or vat, called a bac; the clear liquid is then run off by a cock into a second bac, and after some time into a third, whereby the whole starch will be precipitated. The finest powder collects in the last vessel. The starch thus obtained, containing about 33 per cent. of water, may be used either in the moist state, under the name of *green fecula*. for various purposes, as for the preparation of dextrine and starch syrup; or it may be preserved under a thin layer of water, which must be renewed from time to time to prevent fermentation; or, lastly, it may be taken out and dried.

In the manufacture of starch, a considerable proportion of the product is lost despite every precaution, owing to the strong affinity which the starch has for the fiber of the potato, and it is generally considered that very little more than two-thirds of the quantity of starch in the different varieties of potatoes manipulated, is secured, while nearly one-third escapes. The "slump" or waste, is sometimes by chemical treatment converted, in great part, into sugar or into alcohol, but in European countries it is generally returned to the soil along with the vines as manure, and as it contains nearly all the fertilizing elements of the potato, bnt little exhaustion of the soil is produced by the growth of successive crops of potatoes on the same land, if enriched in this way.

There are several other processes and contrivances for manufacturing potato starch, most of them complicated by the nature of the machinery and the use of chemicals; but these, chiefly employed in huge factories, would be beyond the means of an ordinary farmer, and beyond the skill of one untrained in their use.

Veterinary

SHOEING HORSES.

EVERY veterinary surgeon knows the great errors that are committed by blacksmiths in the matter of shoeing the horse and the proper care of his feet. The chief cause of these is that, as a general rule, the horse owner patronizes the blacksmith that does the work cheapest and makes the shoes stay on the longest, whether the work be inferior or first-class. A great many men do not know the importance of good shoeing, and, of course, the smith wants to suit his customers, so he drives the nails home and clinches them down to stay six months. I saw an instance, this morning, of the evil effects of bad shoeing. A man from the rural district hereabouts came to me and wanted me to put a seton in the shoulder of his horse to cure a disease which never existed—sweeny. Now this man had this horse shod last January or early in February, according to his own account, and here it is the tenth of May and he has not had the shoes even set yet. The poor animal has done the spring's work, plowing, etc., with his winter shoes on!

I had a blacksmith take off the shoes, cut the toes down, pare them out level with the heel and then rasp the whole bottom of the foot to make the surface level and smooth for the application of the shoe. The shoes should be cold or blackhot instead of red-hot, and beveled on the inside, so that the outside will protect the outside crust. They should cover the crust or shell all around the foot, and the heels should not be so wide that the heft of the heel of the foot will crowd between the heels of the shoe and cause contraction of the foot by making a wedge of it. On the other hand, putting the heels in too far will cause corns and contraction. Let the shoe just rest all around the crust equally, the same as it rests on the ground. And do not allow the shoe to be drawn in, and then chop the toe off, for this weakens the shell of the foot and the horse is more liable to be pricked.

Now, when the nailing comes, never allow more than three nails on a side to be put in on the fore-foot and four on the outside and three on the inside of the hind-foot; for the heels of the hind foot are thicker than those of the fore. In road and speed horses, in dry weather, there should be only two nails on the inside, as close as possible. Shoes nailed this way will, as a a general thing, stay on longer than is good for the horse without clinching very close. A horse shod this way will never be flat-footed or have contracted feet, unless it be by standing on a hard plank floor without applying softening agencies to the foot. Youatt says that agricultural horses need no foot softening; nevertheless, in warm, dry weather, they need it every other night. No foot can be deformed without contraction.

It is almost impossible to drive four nails in a horse's foot without driving one opposite or back of the navicular joint, and all of the veterinary surgeons in the world, with the best foot stoppage, could not prevent the feet from contracting with nails back of this joint. I have seen blacksmiths try to point out the navicular or what they called coffin joint; and they would come from half an inch to an inch of it, but on taking a foot that was divided into sections, they would find this joint nearer the toe than they thought. There are a great many blacksmiths who deny this, but the one that does never ought to be permitted to shoe a horse.

A horse never ought to be allowed to stand on a hard plank floor; it onght to be the natural ground—good gravel floor. With this kind of floor and proper shoeing, a horse would never have contracted feet and, of course, that is the beginning of all foot diseases, such as corns, thrush, founder, quittor, toe-crack, and of all the navicular joint diseases. If a horse were shod properly, with only three nails on a side, as close to the toe as possible, on the fore feet, and if he always were allowed to stand on the ground as a floor, flat feet and foot diseases, as well as the so-called sweeny, would not exist. Lame horses would be out of fashion, and so many of our horses would not have to go to pasture with great setons in their shoulders from the effect of contracted feet. When the feet get softened by the moisture of the earth, and the horse gets well of the lameness, then comes around the practitioner who has put in the seton, saying, "Don't you see the seton is the best thing for lameness, and is what does the business?" never thinking it is the moisture of the feet that has produced the good results. One thing is certain, that lameness in a horse is due far more to the owner's and shoer's fault, than to any inherent defect in the animal.

EDWARD O. KINGMAN,
Veterinary Practitioner.

Horticultural.

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

POPULAR FALLACIES.

T. T. LYON, PRESIDENT MICH. POM. SOC.

AMONG the great mass of people who have neglected to thoroughly acquaint themselves with the subject, it is a very common circumstance for a person, who shall chance to have his attention drawn to a fine-looking or well-flavored variety of fruit, just in condition to please his taste or to gratify his eye by its large size or beautiful color, to proceed, upon such slight knowledge of it, to introduce it into his grounds, without waiting to learn whether or not its observed success is exceptional—only to find by dearly-bought experience, that while, once perhaps in a decade or two, a season just adapted to its needs will develop the perfection which chanced to catch his attention; under all other circumstances, it remains a reproach and a failure.

Or, the variety may have attracted his attention when just in bearing upon young, vigorous trees, sufficing to develop beauties or high qualities which disappear as soon as the tree reaches full bearing, or maturity, either from the tendency to overbear, or from lack of constitutional, vigor, or, possibly, from want of proper adaptation to the climate or soils of his locality. Notable cases of this latter difficulty will be found in the old Herefordshire Pearmain, the Ortley and the American Summer Pearmain, to which we may add the Wagener, the American Golden Russet (Bullock's Pippin,) and to some extent Esopus Spitzenberg and many others, while White Doyenne pear, (in regions where it is liable to the cracking of the fruit,) and Hale's Early Peach, (where it proves liable to rotting of the fruit.) are characteristic cases of the former difficulty.

We know of no better rule to govern the selection of varieties to be planted, and to be rigorously applied in the introduction of varieties into existing plantations, than to select them, as a man should choose a wife—upon thorough acquaintance, and a careful study of their peculiarities.

These remarks must, however, be considered to apply only to general planters, and for permanent purposes. Unknown and promising sorts may, very properly, be put upon trial in small quantity, by any one; although, as a rule, this sort of experiment will be better conducted by the pains-taking and observing amateur; from whom the ordinary gardener or orchardist will be able to acquire a knowledge of carefully matured results; while he will avoid the ninety-nine failures, so sure to accompany every case of actual success.

The Swine-Herd.

HOG CHOLERA AND GOVERNMENT.

EDS. RURAL: We are making an effort to get the assistance of our Legislature to enable us to eradicate the *scourge* of our country—the so-called, Hog Cholera. What do you think of it? Is it practicable? If so what plan would you advise? The accompanying slip is from our local papor "The Trimble News," and is the first of a series of articles that will be published, at an early day. S. E. HAMPTON, M. D.

Milton, Ky., May 13, 1878.

"Every farmer is asking for a remedy for hog

cholera, yet where is the man that has ever taken the time and trouble to investigate the nature of the disease? We hear of men cutting hogs open and pretending to say thus and so, but who has ever made a post-mortem or a thorough analysis of the blood and secretions of hogs that have died with the so-called hog cholera? Some say it is a disease of the blood; others that it is caused by corn; others that lice are the sole cause. And so it goes, and of course there are as many remedies, almost, as hogs. One man has found a panacea in poke-root, another in soft soap, &c., &c., almost ad infinitum. It is all guess-work, and our country will continue to lose millions of dollars annually unless Congress or our State Legislatures take the matter in hand and apoint a committee of scientific men—men able and willing to make an investigation that would disclose the cause of the disease; and when this is accomplished it will then and only then be easy to find a remedy"

Industrial Implements.

HAYING APPARATUS.

Of all the operations involved in haying none is quite so laborious as the final disposition of the crop. At least this was the case until the introduction of labor-saving machinery. All appliances directed to lessening the labor have been very generally used, and in no branch of mechanics applied to agriculture has the inventive faculty been exercised to greater advantage.

Quite recently we have seen some haying machinery that happily combined strength, durability, convenience, novelty and cheapness. We refer to the Anti-friction Hay Carrier, and Noyes' Field Pitching Apparatus, made by the U. S. Wind Engine and Pump Co., Batavia, Ill. We give in this issue two illustrations of the Carrier, showing it: (1) just after the pulley to which the fork is attached has run up into the crooked

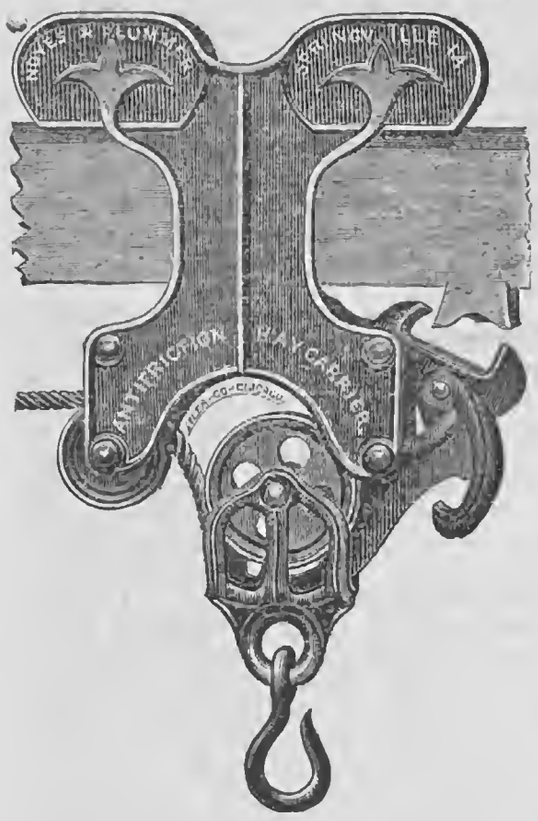

Fig. 1.

arm on which it rides. The carrier is now detached from the lug on the track and has commenced to move off. (2) Shows it in position over the load.

The main and peculiar feature of this carrier is the way in which it is moved along the track. Ten chilled-iron rollers revolve around an oblong bearing in the head. This arrangement gives a large bearing surface and comparatively slow revolutions, which decreases friction to a minimum, and makes it possible for the driver to take hold of the rope with his hands and move along the track with ease after the load is grappled, thus allowing the horses to turn around and return to their place as soon as the forkful has reached the carrier. Another great advantage is, that the carrier runs so easy that if the track has a slight incline, no weighted rope is needed to draw it. It will of its own weight back down the track to its proper position, and the fork will return to the operator on the load. We would call particular attention to the perfect, never-failing grappling apparatus which differs from many others in never clutching and destroying the rope. There is no trouble about getting over high beams, or to the top of high stacks. This carrier may be used for filling barns from within or without; it can be put on or taken off the track, or shifted to run in an opposite direction in two minutes. It never needs oiling, and it is not encumbered with delicate or troublesome rigging, as the rope passes through no loops or rings. The Noyes' Field Pitching Frame is a very ingenious adaptation of means to an end. The entire frame requires but 458 feet of lumber and is braced in a way to combine strength and lightness. It can be quickly shifted to any desired position and when at work in conjunction with the Anti-friction Carrier (for which it was designed,) it accomplishes satisfactory results quickly. It is said that there is practically no limit to the size of stack; that the hay is dropped in the middle at any chosen place along its length, therefore the sides do not become littered, and in settling, the center always being higher than the sides, the stack will not lean, and is sure to shed water. Five tons have been stacked and the frame moved, within the space of forty-five minutes.

Fig. 2.

We would recommend our readers to send for circular "3" issued by this company, as this circular contains a fund of practical information on the subject. Especially a full working diagram of the picture with estimates of the material. With these specifications any one with ordinary intelligence may construct the apparatus. This circular also contains designs for tracking barns.

THE PHŒNIX TILE MILL.

Every practical tile-maker has discovered by experience what a severe test there is upon the strength of the machinery used in the manufacture of drain tile, and how much importance there is in having all the parts sufficiently strong to withstand the very great pressure upon them; but this point may not be so thoroughly impressed on those who propose using a tile mill, but have not had their experience tempered by practice. We present an illustration of a tile mill, made by Chandler & Taylor, Indianapolis, Ind., which is very popular.

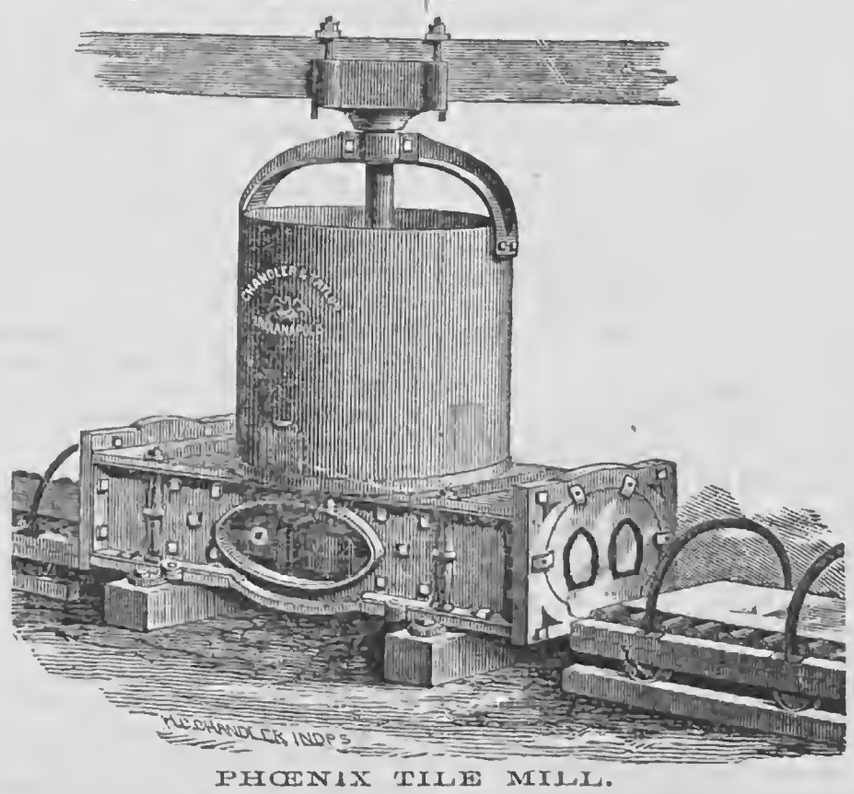
This machine consists of a tempering hopper, an upright shaft, with crank at its lower end, two pressure chambers (one at each end of the machine), and a double plunger, which forces the clay out of the pressure boxes through the dies.

The tempering hopper is made of boiler iron, and a band of wrought iron around the top end, to give it stiffness. At the bottom of the hopper are two openings leading into the pressure boxes. Through these openings the clay is forced at each revolution, by means of a feed wing fastened to the upright shaft.

The pressure box is also a very important part of the mill, as it has to withstand the compression of the mud, and it is also subjected to rapid wear, especially in sandy or gravelly clay. To guard against the first, the plates composing the chamber are made to lock themselves together in such a manner as to be a support to each other, rendering it almost impossible to burst them apart. To guard against wear, the plates composing the pressure chamber have recesses in them to receive false plates, or more properly, wear-plates. All parts of the mill are accessible for oiling, and all parts have a provision for wear.

The cut-off tables are formed with rollers set on iron pivots, which revolve underneath the tile, which comes from the machine in a continuous pipe. At intervals of thirteen and a-half inches there are steel wires set in the top frame, which pass between the rollers, for the purpose of cutting off the tile into convenient lengths for drying. To enable the operator to cut the tile so as to avoid defective places, the tables are mounted upon small car wheels, which move easily on a track, and by this means he can move the table so as to bring the wires to any point before cutting the tile. This feature is peculiar to this machine, and is of great advantage, as all the perfect tile can be saved and only the defective ones thrown back.

The mill illustrated is intended to be run by horse power. It is also geared to be run by steam power.



PHŒNIX TILE MILL.

THE PRINCE ORGAN.

The Messrs. Prince of Buffalo, New York, are among the foremost organ-builders in the country, and are well known to our readers. Many of our agents' homes are embellished with their organs which we offered as premiums for several years. We have ever received the warmest praise of the merits of these premiums. We take pleasure in again calling attention to this firm, and their recent new patterns which combine the excellencies of former styles with recent improvements that cannot fail to be appreciated. The prices are in accordance with the times. Illustrated catalogues are sent on application, and they repay perusal by those wishing to have one of the pleasantest and most refined accessories to the home—a parlor organ.

THE DIRECT DRAFT EUREKA.

The Eureka Mower differs entirely in the principle of its construction from that of any other machine. This difference was prominently brought before the agricultural public during the Centennial field trials. The report of the Judges of Group XXIII. is before us, and after giving a comparative table of the drafts of the various mowers, the chairman, Mr. Coleman, speaks as follows of the Eureka:

"It will be seen from the above that the draft per square foot of grass cut varied from .288, in the case of the Eureka machine (direct draft), to .564 in one of Osborne's machines, or nearly 100 per cent. In reality the difference was not quite so great, inasmuch as the Eureka cut a quarter of an inch higher; but allowing for this, we still have the fact that this machine was the lightest of all that were tried, and, as it is on a totally different principle from the original models, a short reference to its leading features may not be out of place.

"The Eureka is a direct-draft mower,—that is to say, the knife works in front of and between the wheels, and the horses are attached to the center of the machine, equidistant between the wheels, and are so placed, by means of a long neck-yoke, that while one walks on the uncut grass, clear of the knife, the other walks where the track-board has cleared the cut grass; thus the mowed grass is not interfered with, an important point as regards cutting. The wheels are much larger than in ordinary machines. The cutter-bar, which in the machine tested was six feet long, is placed in front of the wheels. The pitman works at right angles with the knife, the connection between the two being a bell-crank lever. It might be thought that the horses treading down the grass would prevent even cutting, but this is not so; did the machine follow the tracks instead of meeting them, we cannot say how it would be, but one great advantage of this form of machine is that it returns along the same line, and therefore meets the grass that has been trodden down.

"Every crop can be dealt with according to its particular form; thus, supposing the grass beaten down in any direction, the machine can be driven at right angles to the lay, and thus good cutting is secured. By a peculiar method of attaching the knife-bar to the frame flexibility is acquired, and we could not see that any machine cut the standing grass more evenly; at any rate, the cutting was sufficiently good. One great merit in this machine is that, owing to having a clearer track on both sides, the cut grass is laid up in a beautifully light, open swath, very favorable for curing. Indeed, in fair weather very little after-work is required. Two horses worked a six-foot cutter with ease. The gearing is simple, no bevel-wheels are used, and we do not see why such a machine should not wear well, and there can be no question that as a mower it is a highly valuable implement." The Eureka is made by the Towanda Eureka Mower Company, Towanda, Pennsylvania.

It is nice to be an Arab during the summer, and go about the country *al fresco*, but we have recently seen an improvement on this way of summering. It is the Hoffmire Portable House. It is constructed in sections; can be readily put together; is water-proof, and for camping-out summer houses, camp-meetings, boat houses, &c., it will more than repay its cost in a single season, in the additional comfort it secures. The houses contain two, three, or five rooms, and weigh from 750 to 1650 pounds complete. Jno. M. Hoffmire, 157 Broadway, New York, is the agent.

Messrs. Bradley & Co., Syracuse, N. Y. write us:—"Having purchased the patterns and materials of the Bradley Manufacturing Co., we shall continue the manufacture, at their old place of business, of all the implements heretofore made by them. We shall endeavor to maintain the high standard of excellence that has characterized their work for so many years."

Steam-Power applied to farm uses, is growing in favor, and as many are thinking of applying the same, it may not be unprofitable to attract the reader's attention to the admirable steam engine made by Messrs. Wood, Taber & Morse, Eaton, N. Y. Mr. Wood is a veteran in the business, and their model has been generally approved by competent judges.

WHAT THEY SAY OF IT.

Clock came to hand all right. Much pleased.
Brooklandville, Md., April 26, '78. S. B.

Received the "Cricket" Clock all right; it runs very well, and keeps first-class time.
Rhinebeck, N. Y., April 26, '78. R. L. S.

The "Cricket" came to hand all right. It is a beauty. It talks as well as it looks. Thanks.
Emporium, Pa., April 30, '78. J. D.

I've received and am well pleased with the "Cricket" clock you sent me. Mrs. T. J. B.
Okolona, Miss., May 11, 1878.

The "Cricket" arrived all right, and we are very much pleased with it. It has given perfect satisfaction so far. W. M. & Co.
Byron, Ill., April 30th, 1878.

Accept my thanks for the "Cricket" clock, which came in due time. It is real nice and keeps good time. Fannie J. A.
Burlington, West Va., April 29, '78.

The "Cricket" goes well. I could have sold it many times, but I shall keep it; but I want my neighbors to take the paper. C. M.
Colenville, P. Ont., Canada, May 11, '78.

We received the "Cricket" all right. It is just what we wanted, and is the delight of the whole household. It is a beautiful little time-keeper. Please accept our thanks. A. H.
Madison Co., N. Y., May 10, '78.

Received "Cricket" in good order; it fully came up to my expectations, and they were placed high. I would not part with it for five dollars. J. W. W.
Warsaw, Mo., May 11, 1878.

The clock sent upon my order to A. M. B—p reached him safely and gives satisfaction. It was exhibited at our Grange—No. 465—yesterday, and was pronounced "a perfect beauty" by all who saw it. Nellie B.
Oakland, Miss., May 7, 1878.

I received the "Cricket" clock by express. I have given it a good trial as a time-keeper, and am entirely pleased with it, and so are all others who see it. The Rural is quite full of useful reading matter and is well worth all it costs, without the "Cricket;" I accept the little "Cricket" as a gift. Mrs. C. E. T.
Emporium, Pa., May 7, 1878.

Of all the weekly agricultural papers of which we are in receipt, we must, in justice, in our judgment, award the premium to the Rural New-Yorker, 78 Duane street, New York city. We were induced to pay for it by the premium of a clock offered to yearly subscribers, for $3.50. our expectations in its manufacture, reliability, and appearance. Besides the paper is well The time-piece we have received, and it is beyond worth the subscription, without the premium. We do not believe we can give our numerous readers better advice that to subscribe for the Rural New-Yorker.—*Florida Dispatch.*

The Querist.

ANSWERS TO CORRESPONDENTS.

An Uniform Flow of Milk for Market.

Walter Severly, Venango Co., Pa., asks how he can best keep up from his cows a uniform flow of milk all the year round so as to satisfactorily supply his city customers; what feed and treatment of cows would best conduce to this end.

ANS.—A system to preserve a good, uniform flow of milk, depends upon circumstances. The easiest and best way during the summer months, if the owner has plenty of pasture, is to turn the cows to grass during the day, and at early evening, give them in the stable a liberal feed of finely ground bran or oats, and after eating this, put them back again into the pasture. If pasture is scarce, keep the cows in the stable during the day-time, and give them two feedings of bran or meal, morning and night, and all the forage they will consume, feeding them three times a day. Put them in the pasture at night. Under any condition let them have all the water they want, and at least twice a day. The quantity of meal should be regulated according to the size of the cow.

Green feed will make the most milk, over any other food, provided it is of such a kind that the cow will eat bountifully of it; but the milk will not be as rich as if the cow was fed some meal with it. For stable feeding in summer, there must be a variety of green forage, beginning with rye, the earliest, and oats, clover, corn and millet in their order. For winter feed, brewers' grains will make a free flow of milk. They can be fed in connection with hay or cornstalks. The largest flow of milk and the most uniform can be produced by cutting the forage, and steaming it, mixed with bran and roots. This form of food keeps the cow the nearest to a summer condition in her food, as it is succulent and laxative, and if fed a regular quantity, will produce a steady and uniform flow of milk. Being fed warm makes it all the more suited to promote immediate and generous secretion, as the system is not chilled, or the digestive functions in any way set back; but, on the contrary, the food is put in the condition to be rapidly and freely digested, and the rumen emptied ready for another supply. To have a uniform quantity of milk, the cows should be managed so that they will become new milkers at different times of the year. A good cow is an essential part of a dairy, and should be thought of first. A warm stable in winter is another important consideration. The stable should be so warm it will never freeze, and the cows should be kept in it all the time, except while they are getting a drink. The stable should be so constructed that the cows can lie down comfortably. When a cow is cold and weary and restless, she will not do well. Let them have room to move about a little, and lick themselves, and keep them warm, and give them all of the succulent food they will eat, and there will be a generous reward.

Seeding Potatoes.

W. H. Mower, Cheshire Co., N. H., asks about seeding potatoes so as to obtain the best results in quantity and size; 1. how many bushels should be used per acre; 2. should the tubers be planted whole or cut to single eyes.

ANS.—By all means cut the potatoes, even if so small that a whole potato is needed. Cut potatoes, especially if the cut surface is slightly dried and hardened, push the shoot much more rapidly than potatoes planted whole. With regard to amount of seed needed, it varies with different sorts, size of potatoes and distance of the hills from each other. With hills three feet apart each way, Early Rose and Early Vermont, from three to five bushels are enough; of Peerless and Late Rose five to eight bushels, per acre; Cut in pieces with two or three good eyes and plant one piece in a hill of the early sorts, and two pieces per hill of strong-growing varieties. On rich soil Peerless and Late Rose will often grow too large and misshapen, if only one piece per hill is planted. Planting two pieces per hill remedies this evil, making more potatoes and of good market size. It is much better to have two pieces with two or three eyes each than one piece with five or six eyes. Reject any small, and all unripe potatoes. Those about the size of hens' eggs of Early Rose make good seed, and can be cut in three to six pieces. It does not pay to cut to single eyes except with new and very scarce varieties. Good crops are thus grown, but it is too much labor. Drill culture is also expensive, and of no advantage to strong-growing sorts; but of Early Rose more potatoes can be grown per acre in drills three feet apart and potatoes 15 inches distant in the rows. But this rarely pays. Fully 150 to 175 bushels of Early Rose can be grown in hills 32 to 36 inches apart, with most of the work of cultivation done with the horse-hoe. Unless land is very scarce and labor very cheap, hills, with rows both ways, are much preferable to drills.

Remedies for Gapes in Chickens, Etc.

Frank Crane, Wayne Co., Ohio, asks, 1, for some means of preventing a cow losing her milk towards the end of the day; 2, a remedy for gapes in chickens.

ANS.—To prevent a cow losing her milk towards evening: milk her three times a day until the tendency to do so, is removed. See also answers to E. M. A. in this department. 2. Spring is peculiarly the season for gapes among chickens, and every year, as it comes round, inquiries are made and answered with regard to its treatment. As it is due to the presence of gape worms in the windpipe of the chick, these must be removed or killed before it can remedied. To effect this numerous means have been found more or less effectual, among the most strongly indorsed of which are the following: Strip off the vane of a small feather to within an inch of the end; dip this in spirits of turpentine and then thrust it down the windpipe; give it a turn or two and draw it out quickly, bringing out the worm or killing it. Another: blow tobacco smoke into the chick's mouth; a portion will pass down the windpipe as it breathes, thus reaching the worm and often killing it. A better way: twist a horse-hair, making a small loop at the end; insert this in the chick's windpipe, give two or three twists with the thumb and fore-finger, and a quick pull out will generally bring to light a couple of worms about half an inch or more in length and of a blood-red color. If unsuccessful at the first attempt, try again, and continue until all the pests—sometimes as many as a dozen or even more—are removed. Camphor, a very strong vermifuge, is also said to be an excellent remedy. It is usually given in small pills, about the size of a pea, especially in the early stages, and also diluted in the water the chicks drink. Gapes is nearly always the result of foul water, exposure to wet and want of proper nourishment, unless when it is communicated from infected fowls. These causes should be abated, of course, and the afflicted chicks strictly separated from the others.

How To Use Paris-green.

W. L. Gray, Somerset Co., Pa., asks, in view of the early appearance of the Colorado beetle, and in consideration of this being his first season on a farm, how Paris-green should be used.

ANS.—The easiest, quickest and safest way is to mix Paris-green with water in proportion of a tablespoonful of the former to a pailful of the latter. Use a brush or swab, made by tying a handful of fine corn-husks to the end of a stick two or three feet long. Take the pail in one hand and the brush in the other, give each plant a thorough sprinkling, stirring the water from the bottom of the pail occasionally as the Paris-green settles, and taking two rows at a time. The sprinkling should commence just as soon as the young beetles or larvæ make their appearance and, if a second swarm appears after the first has been laid to rest, the newcomers must be treated in the same prompt manner as their predecessors. A common watering pot with a rose may be used instead of the brush. The powder may also be mixed with flour or plaster and dusted in the cool of the morning according to directions frequently given in these columns.

To Prevent a Cow Leaking Her Milk.

E. M. A., Smithville, Ont., Canada, asks for some method practiced by farmers for preventing a cow from leaking her milk.

ANS.—Several ways of remedying this evil are in practice among farmers: First, after milking, place an India-rubber ring round the teat, to be kept there for two or three days at a time, during three or four weeks, until the udder expands sufficiently to hold the milk. Second, milk the cow three times instead of twice a day until the muscles of the teats gain sufficient strength to hold the milk from morning until evening. Third, immediately after milking, wipe the teat dry, and with a small brush apply to its end a small quantity of collodion that may be had at the druggist's. This at once forms a thin, tough membrane or skin which will prevent leakage, and is easily removed before milking. Fourth, take white-oak bark, put it into water, boil it down to a strong solution; then, after every milking, soak the ends of the leaky teat or teats in the solution for a few minutes, and prevention is said to be sure. These four remedies are given separately by practical farmers, each of whom says he has found his successful; if all prove useless, take the cow to the butcher, as he alone can remedy the evil.

Ayrshire Cattle.

A Subscriber, Oconomowoc, Wankesha Co., Wis., asks whether the Ayrshire cattle are a distinct breed or only the product of crossing other breeds.

ANS.—The present Ayrshire cattle are undoubtedly entitled to be considered a distinct breed, having the faculty which constitutes a breed—the power of certainly transmitting to their progeny their own distinctive charactoristics. After an examination of many authorities on the subject, Youatt concludes that the ancestors of the present breed were introduced into Ayrshire, Scotland, and the adjacent districts, by the Earl of Marchmont, between 1724 and 1740. It is conjectured that they were originally either of the Teeswater breed, or derived from it. It is by crosses from these original progenitors with the native cattle that the present improved breed of Ayrshires has been developed.

Miscellaneous.

A Rural Reader, Troupsburgh, Steuben Co., N. Y., asks whether the Cape Jessamine is a house plant by nature, and what treatment does it require in order to make it blossom.

ANS.—It is a hardy greenhouse plant; that is, it will endure some exposure. It may be used as a bedding plant during summer and removed to a frost-proof shelter during winter. It should be potted in a mixture of light loam with a small portion of white sand and well-decomposed manure. The proper name of the Cape Jasmine or Jessamine is Gardenia.

Treatment of Hoyas.

Mrs. P. D. W., Park Place, Arkansas, asks what is the matter with her Hoya. It looks fresh, after being in her possession two years, has plenty of vigorous-looking roots, but only a single leaf which appears to get thicker; otherwise there is no change in it.

ANS.—Hoyas like a stove heat and full exposure to the sun, and the soil should be fibrous with a little loam and sand, adding bits of charcoal to keep the soil open.

NOTES FROM THE RURAL GROUNDS.

BERGEN COUNTY, N. J., May 15.

THE FROST.

WHEN in the care of fruits, vegetables, crops or plants of any kind, disasters come which by a little extra work or thoughtfulness might have been averted, we are full of self-reproach for the neglect. When, however, our best endeavors fail to avert disasters, there is much of consolation in the thought that the misfortune was not merited. So far as possible we had prepared for a sharp frost. The bedding plants were covered in so far as we could provide articles with which to cover them. Even the grape vines were covered with newspapers. Not less than thirty varieties of grapes showed buds, many of them for the first. Some of the stronger-growing had made shoots eighteen inches long. But the frost was too severe to render the paper-protection of any value. The shoots were withered and blackened to the buds from which they sprang. All of the bedding plants were injured or killed outright. The leaves of Magnolias and the flowers of those which were blooming were seared as if by a burning wind and these trees look, as we write, as if it were late fall instead of late spring.

The effects of this frost were very peculiar. It would seem that had it been a trifle less severe, it would have done comparatively little harm, and had it been a trifle more severe, it would have done incalculably more harm. For instance, the topmost leaves of one Tulip tree growing in a high, southern exposure, were withered. Upon another Tulip growing in a northern exposure upon the banks of the lake, not a leaf was touched

In one part of our grounds, the new shoots of the Norway Spruce wilted over so as to rest upon the stem. In another part they were not appreciably affected. In one part, the new shoots of Picea firma were killed; in another, but slightly injured. The leaves of one Wistaria were scorched; of another, not at all. Some of the green strawberries were blighted; others not harmed so far as can be judged at present. About this neighborhood, corn three or four inches high, was cut off in patches over the field, while the rest was unharmed. So of potatoes. While in other fields the corn was everywhere killed and the potatoes blackened to the ground. In some localities, not over half a mile distant, the frost was very light—in others persons did not know there had been any frost. One thing we observed that may be worthy of note, is that purple-leaved varieties did not suffer the same as green-leaved varieties or species. The leaves of such shrubs and trees as the purple-leaved Filbert, purple-loaved Berberry, Birch, Beech, Oak, &c., were not, so far as we could discover, curled or wilted in the least, while those of the hardy Yellow Wood, yellow-flowering Horse Chestnut and green-leaved Oak (Quercus fastigiata,) Hazel and Birch were.

One is very apt to exaggerate the damage done on such occasions in the first flush of disappointment. In reality it is not a very serious matter. Corn can be planted again—potatoes will keep on growing though the check may lessen the yield and make the crop a little later. We do not shed tears over the destruction of our tender bedding plants. We can replace or go without them. Besides, we knew there was still a likelihood of frost for three weeks when they were put out, We danced—and we propose to pay the fiddler cheerfully. But our grapes! Some of them were seedlings just coming into bearing. With a parent's fondness we would like much to have seen them fruit this season instead of waiting another interminable year. But we suppress the tear. The grapes might have proved sour, and disappointed our hopes. We will hope on another year. A sweet hope is better than a sour reality.

RURAL SPECIAL REPORTS.

NEW MARKET, Shenandoah Co., Va., May 13.

I LIVE in what is called the Shenandoah Valley, lying between the North Mountain and the Massanutten Mountain. The land lies generally rolling, interspersed with creek and river bottoms. The soil throughout the Valley is generally fertile; almost all kinds of cereals are grown here, but wheat and corn are the chief products. This country is well watered; a number of mills are in operation along the streams, and there's room for a good many more. Mills and factories of various kinds are needed. The climate here is healthy; epidemics and malarial diseases are not experienced here.

Any one of the RURAL readers wishing a good home, can find one here; people are social and hospitable. Virginia is justly famous for her valuable mineral springs. Among those that deserve honorable mention, is the popular and delightful summer resort, known as the Valley View Springs. Any one wishing to spend the summer in the country can do so to their heart's content at these springs. They are situated in the mountains of the valley of Virginia, two miles east of New Market, on the New Market and Sperryville Turnpike, and four miles from the New Market depot. This location is one of the highest and most easy of access in Virginia; the air is the purest and most bracing; the scenery grand and picturesque. The waters, white and yellow sulphur, are without their equals, and the iron or chalybeate water is equal to any in the State. These waters, as a tonic or alterative, cannot be excelled. We've been having cool, wet weather since the first of May with the exception of a day or so. The farmers have not finished planting corn yet owing to the wet weather. Some of the farmers have plowed their corn already, while others have not planted yet. Wheat looks well; a fine prospect for a good yield here; it is mostly in head at present. There are more acres sown in wheat here than usual; oats are up and look promising. Wheat is worth $1.10; corn, 60@75c.; oats, 35@40c. per bushel; butter, 15c. per pound; eggs, 10c. per dozen. P. S. W.

LINDEN, Union Co., N. J., May 14.

LAST evening the thermometer, at 7 o'clock, stood at about 50° on the north side of my house; and at 3 o'clock this morning it was down to 28°, and at 7 o'clock it was up again to 50°! Ice was formed on water in a pail at my pump, as thick as ordinary window glass, and the result of the frost is severe. Potatoes, early corn, beans, tomatoes &c., were cut down. I never plant corn, beans, and other tender vegetables till the 15th to 20th of May, so I escaped loss in these things; but the thousands of silly people who cannot witness mild weather in April, and in early May, without rushing in seeds of all kinds of vegetables, will learn a lesson by this frost, that they will remember one year at least. Grape vines in some places in this vicinity were badly injured. Mine were not much hurt, but how the young shoots and setting fruit could stand a degree of cold uninjured, four degrees below the freezing point, is a mystery to me. In an acre of vines only one year old, all leaved out, the frost took one here and there—one in ten perhaps—leaving the others untouched. I account for this by the fact that frost of a light degree goes in veins, or currents, cutting down plants as the stronger currents happen to strike them. T. B. MINER.

CORRY, Erie Co., Pa., May 13.

FOR the past three weeks there has been so much rain that it has made farmers somewhat backwards in doing their spring work. Things are from three to four weeks earlier than common. Wheat and all kinds of fruit promise a large yield if the cold spell that we are having at present does not destroy them. On the night of the 11th ice formed to the thickness of window glass, and last night, the 12th, it looked as though we were all going to be frozen up; but we were happily disappointed, when we got up in the morning, by finding the ground all covered with snow in place of a hard freeze. It is warming up so well now that we may escape disaster this time. Butter is worth 15@16c.; eggs, 10c.; potatoes, 25c.; oats, 32c.; and corn 50c. per bushel here. C. D. S.

HUNTER'S BOTTOM, Carroll Co., Ky., May 13.

WHEAT is rusting badly, and that which was the most flattering prospect for an abundant harvest ten days ago, is now the most discouraging; although our old farmers say that red rust does but little damage, while the black rust is fatal; and as it is, so far, only the red, we "hope against hope" that our fears are unfounded. Our wheat is in full bloom and the heads are exceptionally large.

S. E. HAMPTON.

WARSAW, Benton Co., Mo., May 12.

WHEAT in the prairie portions of this county (Benton) looks bad, while the timber portion

promises a fine yield; corn about all planted. Corn worth 25c.; wheat, 85c.; potatoes, 20c.; stock hogs, 2c. per pound; fat cattle, $3 25; cows and calves, $20@25; land from $1.25 per acre to $15; eggs, 5c.; butter, 10c. Season at least one month ahead of last season.

J. W. W.

RURAL FARM, Long Island, May 16.

FROST has destroyed all beans both bush and running. Tomatoes were much harmed. Corn is badly bitten but will probably recover. Potatoes were harmed. Perhaps one-fifth of the vines are blackened. Spring Wheat and Oats are very fine. Potato beetles in abundance and a larger deposit of eggs than we have ever before noticed.

COBLESKILL, N. Y., May 13.

IT is very cold here to night; heavy frosts in Utica, Little Falls, and St. Johnsville; ice in the hills at St. Johnsville. We had quite a heavy snow storm this morning. There is every prospect of ice making here to-night, as it is clear and cold. R. H. N.

FLUSHING N. Y., May 16.

THE frost made a clean sweep of our grapes destroying half an acre. The seemingly delicate foliage of the Japan Maples was not harmed in the least. S. P.

ALBANY, N. Y., May 14.

IT is a little warmer to-day. As far as I can hear the frost through Central New York has done but little if any damage. W. H. K.

Dairy Husbandry.

SHALL DAIRYMEN INVESTIGATE?

J. M. PETERS.

"I SUPPOSE, chemically speaking, there are differences between these brands of salt, but, practically, the only point I can see that should be watched by the butter dairymen is to see that the salt is white, dry and free from lumps and trash of every kind. The chemical distinctions are beyond our ken, and as long as we cannot see them, there is no need of looking for them."

THE above is the closing paragraph of an article, by Mr. L. S. Hardin, descriptive of a salt test, in which the writer, as the few lines quoted would indicate, failed to detect any difference in samples of butter from a single churning, salted, respectively, with Ashton's, Higgins' and a "mongrel" brand. I do not propose to enter into a controversy with Mr. Hardin upon the merits or superiority of any brand of salt, but I must mildly protest against his assertion that there is no need of looking for things which we have reason to believe exist but which, on a cursory examination, we cannot see. It would be unjust to Mr. Hardin for us to accept his own words as indicating a real indifference on his part to the hidden mysteries of his profession. He has been too keen and studious an investigator of all that relates to the practice and science of dairying, to merit the reputation which he would give himself, of being a man content with mere "surface indications," and before the ink was dry on the article from which I have quoted, I will venture to say he had conceived some more searching test by which he might determine the chemical differences which he feigns to ignore.

In any event, it is dangerous for the dairyman, or for the farmer in any other branch of his calling, to content himself with a superficial knowledge of his work or of the manifold methods and materials which enter into it. The chemical researches of Liebig, of Johnstone, of Sturtevant, of Arnold and of others who have labored in the field of agricultural chemistry, have helped to make the studious American farmer, and above all the American dairy farmer, the leader of his class throughout the world. It is not appointed unto every farmer to be a chemist, but agricultural chemistry, as it is given in the RURAL and in others of the journals which devote themselves to this great work, is brought within "the ken" of every man, and his practical knowledge should enable him to apply it profitably in the tilling of his land, the raising of his herds and the manufacture of his products.

I agree with Mr. Hardin that there are chemical differences in dairy salts, and while his tests have failed to develop them, equally simple tests that I have witnessed, have shown most plainly that these differences may be detected by very simple tests, involving no other chemical processes than are at the disposal of every dairyman. A glass of water and a few ounces of salt will afford means for a test which has convinced me of some differences in dairy salts. Moreover, I have seen differences in just such tests as Mr. Hardin made, result in clearer evidences of the chemical differences than he was able to obtain. I cannot, however, pretend to settle this point, but should prefer leaving it to every dairyman to make his own tests, cautioning him, meanwhile, that nothing that he may even suspect is so far "beyond his ken" as to warrant him in remaining ignorant of its actual existence and character.

PARIS GREEN AND THE POTATO BEETLE.

FROM letters received we find that there are localities to which the Potato Beetle has been a stranger until now. We find also that there are many who now propose to use Paris-green who have opposed its use before, and finally that there are many who are not familiar with the best methods of mixing and using it. The topic is timely and we will therefore repeat in brief what we have said at length many times before. Some prefer to mix the Green with water—others with flour or plaster. Either is quite effectual. In the one case a watering-pot that will hold a pail of water—in the other a sieve of some kind is needed. Any tin vessel with holes punched in the bottom will serve. A flour-sieve with a covering of muslin or paper tied about it answers well enough.

To twenty parts of cheap flour or plaster, add one part of Green and mix thoroughly. Sift this upon the leaves before sunrise while they are filmed with dew. It is labor and material lost to wait until the dew has been in part or wholly evaporated, since there is nothing to hold the dry powder and the first breeze blows it away. We find even now that there is an impression that the contact of Paris-green with the beetle or its larva is necessary to kill it. Contact however does no harm. In eating the leaf a minute quantity of the poisonous powder is eaten and the bug is thus destroyed.

A heaping tablespoonful of Paris-green may be stirred into a pailful of water in quantity and applied as we have above indicated stirring it the while as the Green is not soluble in water.

The present beetles will effect comparatively little injury to the vines but each of the females will lay perhaps a thousand eggs. These may now be found in clusters upon the under part of the leaves. They will hatch out in a few days and then their work of destruction begins.

THE FRENCH EXHIBITION.

THE international Exhibition opened in Paris on the first of May, is at once a convincing proof of the marvelous recuperative power of the French nation, a powerful evidence of the pacific disposition of the most belligerent race in Europe, and a strong testimony to the stability of the newest republic in Christendom. 'Twas only yesterday that battered France lay prostrate at the feet of arrogant Germany, her government overthrown, her industry disorganized, the remnants of her once invincible armies prisoners in Germany, exiles in Belgium and Switzerland or demoralized bands struggling vainly though desperately against overwhelming odds on her own devastated soil—the proudest people in Europe so utterly crushed and humbled as to draw forth the warmest sympathy of friends and even the pity of national foes. She rose exhausted with her efforts, weighed heavily with a load of debt purposely placed upon her with the design of keeping her down for a generation at least; but resolute, self-reliant and still full of spirit. In a few short years she has cleared off her indebtedness, organized a free and stable government, so thoroughly restored her industry as to be able to challenge the world to compete with her, reformed her armies, so as to place her once more in the foremost ranks of European nations, and now while the whole neighboring continent is groaning under the burden of warlike preparations, France calmly invites her admiring friends and foes to her beautiful capital there to witness a grand display of the arts of peace.

CHANGE IN THE AMERICAN AGRICULTURIST.

DOUBTLESS it *is* "a matter of regret to the friends of The Country Home that its publication should be indefinitely postponed." We had proposed to give it an immense welcome. It was to have been a glorious journal—printed upon highly-calendered paper, beautifully illustrated and ably edited. It was to have been the RURAL NEW-YORKER inspissated, refined, perfected so far as we could judge from what we heard and read. The price was to have been $3.00 and the size that of the Christian Union. At the eleventh hour the managers discovered what seemed to them a better opportunity of "expending their energies," than that of a "new and untried enterprise notwithstanding their faith in its ultimate success." The managers trust that this "combination" (if the word can be used to express the adding of something which was to have existed to what does exist) will be as the "engrafting of fresh and vigorous cions upon a sturdy tree, still in full vitality and that the product will be acceptable to all who shall gather the fruit."

Mr. ORANGE JUDD remains as President of the Company but he will be relieved from the "brunt of the work." Dr. GEO. THURBER also, the new managers think, "has nobly earned the partial relief which comes to him at this time." We are right sorry that The Country Home was not born. But we are glad that the suppressed embryo is, as it were, dissolved and injected into the veins of the old Agriculturist. "Mr. E. LIBBY takes the position of managing editor of The American Agriculturist and Mr. BECKWITH that of Treasurer of the Company."

HOW TO CONTROL THE BEARING YEAR.

EVERY strong man is capable of doing a limited amount of hard work. Any work beyond his powers of endurance, however, exhausts him and a longer period of rest is required than usual to restore his wonted physical powers. The same as he is capable of a certain amount of work, he is benefited by a certain amount of food. If less than enough, his strength is impaired. If more, the functions of his system are harmed by surfeit Is the analogy good if applied to fruit trees? It appears that the tendency of fruit trees is to overtask themselves. They are taxed too heavily one season—they recuperate the next. How can we treat our apple trees so that their work shall be distributed evenly from year to year? If the soil affords an abundant supply of food we have only to regulate their work. We have to deprive them of the means of exhausting themselves so that they shall perform just the amount of work of which they are capable without exhaustion. If the soil does not naturally supply a sufficient quantity of food, we must enrich it so that it will.

If it is true that if the vitality of an apple tree is so impaired one year by bearing an excessive crop that it fails the next, it would seem to follow, supposing the tree derives from the soil in which it grows suitable and sufficient nourishment, that, if in the bearing year it were deprived of half of its fruit as soon as it had formed, it would be in a condition to mature a crop the next year also.

HILLS OR DRILLS.

ONE of many experiments tried at the Agricultural College farm of Kansas in 1876 sets forth the comparative merits as between the old method of planting corn in hills and that of planting in drills. Four plats were laid off across a portion of a field quite uniform as to the character of its soil. Each contained four rows of corn, the rows being three and a-half feet apart. In the first plat the corn was planted in drills; in the second in hills, after the usual way; again, the third was planted in drills, and the fourth in hills. When the corn was about six inches high the drilled plants were thinned out, leaving the stalks as nearly as possible ten inches apart in the rows; the plats in hills were likewise thinned out, leaving the same number of stalks in every plat throughout the experiment. In cultivating the plats care was taken to give each the same treatment, and beyond thinning, hoeing once and cultivating twice, no special treatment was given the plats. The corn was husked November 11th, and the weighings showed for the drilled plats a yield of 71 bushels per acre; for the plats in hills, 62½ bushels per acre—an advantage in favor of the method of planting in drills of 8½ bushels per acre.

Raising Corn.—Among the controversies of the Ohio Farmers' Club, it is stated that "it don't require any *scientific* attainments to raise good corn, if the land is good, but it does require some practical common sense and some industry." If science is anything it is knowledge—it is truth ascertained. If common sense means anything in particular, it means a certain amount of intelligence which enables one to perform certain simple acts as they should be performed. But how was that "certain amount of intelligence" obtained? Was it inherited? Did it come without investigation? The best methods of the present which may have been handed down from generation to generation are not the less due to science because they were discovered centuries ago. All who intelligently observe and investigate are scientists to that extent, and every discovery that flows therefrom is due to what is termed science, call it by whatever other name we will.

Hints about Insect Pests.—The white-ants, or termites, about which there has been a scare now and then, are justly feared. Remember that they are not ants at all, but get their name only from a very superficial resemblance to ants. The sexual individuals are already developed and will fly abroad in June. The colonies live in damp, dead wood, such as stumps and the boarding of cellars. They will suddenly spread through the timbers of the house and reduce them to shells, when—down comes the house, with the people in it. For Aphides, when leaves cannot be washed, encourage the Syrphus (Gay-fly), Coccinella (Lady-beetle), Chrysopa (Lace-winged fly), and discourage ants, which latter take care of the plant-lice and defend them from their enemies.

Alternation.—It is the undoubted fact that unmanured land upon which is grown the same kind of crop year after year, becomes "exhausted." Will this same land nourish other plants without manure? If it has become exhausted for wheat will it grow rye? How is it with the forests? Can they support, without any rest, the same trees for ages? Do the leaves which fall supply to the soil all that the roots have withdrawn? How can we explain then the fact that where once flourished Beeches, Birches and Oaks years and years ago, now we find Pines only, and, *vice versa*.

English Sparrows.—In connection with the English Sparrow, let us say: It was introduced to exterminate the inch-worm (popularly so-called) from the streets of some of the cities of this country. It did exterminate it. We knew when the experiment was tried the low estimate in which the Sparrow was held in England. Our cities were rid of the inch-worm,—the country is alive with the English Sparrow! The remedy for the cities is the disease for the country. The country people have now to set about exterminating this disease for the introduction of which we have to thank our city friends.

BREVITIES.

TORCHON lace is much used on lawns. Lawn mowers are not needed.

THE first ripe strawberries in the neighborhood of the Rural Hort. Grounds (Bergen Co., N. J.) were picked the 18th inst. They were Wilson.

The chief lesson which Mr. Mechi's (England) last balance sheet gives is the policy of striking out unusual lines of action for oneself upon the farm in bad times.

MR. BATEHAM says that 20,000 bushels of strawberries were grown about Cleveland in one season and consumed by that city. The port of Norfolk, Va., reported about 100,000 bushels of strawberries for 1877.

THE price of Asparagus has doubled owing to the frost which in many places killed the shoots to the ground. As we go to press (Monday) a warm steady rain is falling and everything injured by the frost fast recovering.

MICHIGAN State Pomological Society. The summer meeting is announced by Secretary GARFIELD to be held in the city of Jackson, Tuesday, Wednesday and Thursday, June 18, 19 and 20, commencing with an afternoon session at 2 o'clock on the 18th, and closing with a morning session on the 20th. The programme is as usual, attractive and practical.

MR. HENRY KING, writing of "Old-fashioned flowers" in The Western Homestead, says: Let us have them, then, in profusion. Land is plentiful, the seeds cost but a trifle and the air and sunshine will cheerfully do most of the gardening. The only thing in the way is snobbishness, for the old flowers are the ones God gave to the world when the world was a paradise; and what was good enough for Eden is good enough for Kansas.

THE second annual Bench Show, under the management of the Westminster Kennel Club, was opened in New York on the 15th and continued for three days. The large structure, Gilmore's Garden, was well filled with representatives of every valuable breed of dogs. Setters predominated. Toy dogs, such as Pugs, Terriers, Dandie Dinmonts, and Japanese specimens, attracted the curious, while *connoisseurs* gathered about the Beagles, Pointers, Setters, and other breeds valuable for their useful qualities. The representation was large, and the quality above the average.

THE Agricultural Gazette of England gives the following curious manifesto issued by some agriculturists of the county of Essex on the state of their affairs and the low price of labor: "*A Proclamation to our worthy laborers.*"—We, the neighboring farmers, deeply deplore our inability to continue the present rate of wages to our worthy laborers; the fact is, we cannot afford it. Free trade has brought us into close competition with foreigners, who pay so little money for labor, that dark-brown rye bread, skim-milk cheese, and a few onions, is (*sic*) all the men get. With these foreign serfs, who are bought and sold with the land, like cattle, are we now contending in our own markets. Much as we deplore it, we are obliged manfully to tell you, that if we are to give you constant employment, we cannot pay the present wages. Essex must come to what many other counties have already come—6*s* and 7*s* a week. We will give as much as we can, but it must be in proportion to the price of corn; the money lost by farmers this year is dreadful. Down with the malt tax! God save the Queen!—Billericay, March 14." [1851]

IN the proceedings of the Michigan Pomological Society, we commend the following remarks of Mr. THOMAS to some of our farmer-readers: "I am a very plain man, and perhaps most of you would not think from a gaze at my exterior that I am a passionate lover of flowers. But there is nothing in which I take greater delight, and from long experience in farm-life I can say that, although I have given a great many hours to the cultivation of flowers, the time thus spent has been by no means lost. I am no poorer for my flower garden. I am richer in all that makes my life worth living for. And when any man excuses himself from assisting his wife and children to arrange a flower garden because he has no time for such foolish things, I set him down as one who does not take any broad ground in matters of real economy. I look upon economy as something that applies to more than a man's pocket-book. It looks to the health and happiness of his family, and it is my conviction that there is nothing connected with farm life that has more elements of true economy in it than the plan of spending time and thought among the flowers."

MR. MECHI, a distinguished English farmer, to one who asks his advice, says:—"Without a thorough knowledge of farming and suitable conditions, it is a business to lose money by." In conclusion, he says:—"I know some sharp men of business, not bred farmers, who make farming pay." The inquirer replies to Mr. MECHI, from which we quote:—"I know nothing of farming except from book reading. Well, nor did I of vegetable gardening; and yet I have succeeded very well in that line, going chiefly by book instruction and using such common sense and observation as nature furnishes me with." The editor of the London Agricultural Gazette, in which the correspondence is published, strongly dissuades the inquirer from investing his capital in farming and suggests that he had better deny himself enough to pay the annual premium on a life insurance out of his £300 per year (his income) and leave the agricultural venture alone. But it is an unfortunate fact that the advice of the most experienced men as to whether others should engage in this or that occupation, is of little value. If the man who desires so to engage in any particular employment will take pains to ascertain what others *have* done, situated substantially as he himself is, he is himself the best judge whether to engage in it or to let it alone.

Literary Miscellany.

TO ALBERT PIKE.

Suggested by his Article in Rural, entitled "Every Year."

J. T. MORRISON.

To me each budding spring doth brighten
Every year,
And the fragrant blossoms whiten
Every year,
The April showers earlier quicken
The leafing trees—and verdure thicken
Every year.

Altho' I know I'm growing older
Every year,
The world to me does not grow colder
Every year,
Tho' sorrows with my loves are blended,
My joys of friendship are not ended
Every year.

Tho' my infirmities remind me
Every year,
That my youth I leave behind me
Every year,
Yet affection's ties shall bind me
To this life (till death shall find me)
Every year.

And as life's shadows lengthen
Every year,
Then my thoughts of love shall strengthen
Every year,
More firmly grow the recollection
Of earthly friendships and affection
Every year.

CORA.

STANLEY bent over the little jeweled hand, and touched it with his lips.

"Where are you going now?" asked, Helen, lifting her brilliant eyes to his face, inquiringly.

"To the club," he answered, "at once;" but when he entered his cab, which was waiting at the door, he desired the servant to drive to No. 17 Rivington Square, and then stopped at the house inhabited by Sir Alan Vincent. The door was opened by Marks, whose quiet face showed no sign of recognition of the visitor, except that an evil gleam shot for a moment into his blue eyes.

"Her ladyship is at home, my lord. Sir Alan is at Richmond."

And the Viscount followed a footman up the broad staircase into the drawing-room, where Cora was sitting alone. She started nervously when she saw who her visitor was, but greeted him with some self-possession.

"I am fortunate in finding you at home, Lady Cora," he said, as he seated himself opposite to her. "I have been unlucky several times."

Cora colored faintly, and murmured something in excuse.

"Nay, I know you have many calls upon your time," he said; then added, with a soft reproachful intonation, "or was it purposely to avoid me, Cora?"

She flushed hotly to the roots of her hair, and her lustrous eyes met his proudly.

"Lord Almane!" she said, haughtily.

"Oh, pardon me," he said, sadly, "I forgot that what gives me so much pain gives you none. What mockery it is," he added, passionately; "what madness to believe in a woman's constancy!—a woman's truth! No such thing exists."

Cora sat proud and silent, her eyes downcast, her mouth set, but he saw the little hands on her lap tremble.

"Forgive me," he continued penitently. "I forget—I forget. Cora, the sight of you brings back old days, and blots out the remembrance of the present; for a moment I am happy again, and then the bitter reality comes back."

"Let us talk of something else, Lord Almane," she said quietly. "The past does not interest me at all, and the recollection of it can give you no pleasure."

"Can it not?" he answered, mournfully. "It is a sad pleasure—but still a pleasure. They say, you know," and he turned to her with a wonderfully sweet, sad smile, "that the saddest words in our language are—'what might have been!' but if they are sad, they have still a little drop of sweetness when they remind us of the happiness which was once within our reach. But you—you are very happy, Lady Cora?"

"Very," she answered, gently, for the extreme sadness of his voice and mannner touched her against her better judgment. Then she added, rapidly; "Tell me something about your travels abroad, Lord Almane. That will be more interesting than my domestic bliss."

"Nothing that concerns you, in however small a degree, is uninteresting to me," he replied; "and yet I feel, Lady Cora, that my own conduct must require some explanation. Will you let me justify myself in your eyes?"

"There is no need," said Cora, haughtily.

"But there is," he returned. "You shall not think badly of me—you, the only woman I ever loved. Let me speak this once, Cora; I will not trouble you again."

"Be it so," she said, coldly; "let it be as brief as you can, my lord."

Shortly after you left England," he rejoined, "my engagement to Lady Lucie was broken off. I was hastening to you to offer you the love which had been yours for so long, when I heard of the terrible bereavement you had sustaind. At such a moment it seemed to me as if even my sympathy must seem an intrusion, and I hesitated. You returned to England, and I heard that you were engaged then to the man I had seen at Mrs. Colston's, your brother's friend and messenger, Sir Alan Vincent. Cora, I was in despair. I longed and yet dreaded to see you. Nay, one day calling at Lady Martyn's, I heard that you were there, and I fled the house rather than look upon your beauty, and know that you belonged to another. Ah, Cora, it was not quite—and yet I can blame you."

"Lord Almane," said Cora, eagerly, "will you believe me, when I tell you that it was quite two years after my return from Italy that I became engaged to Sir Alan; that at the time of which you speak I was quite free."

"Oh, Heaven! and I lost you thus." He buried his face in his hands with such an air of grief and suffering, that Cora's eyes filled, and then ensued a long silence.

She spoke at last, and her voice had a very gentle intonation:

"Lord Almane, of what avail is it to look back upon the past? We were both deceived it seems, and we have suffered; but all that is past now and you must see with me the folly of remembering what cannot be undone."

"It is well for you," he said, bitterly—"you, happy and loved; while I——"

"You will be happy, too," she said, gently. "Do not waste time in useless regrets. We can be friends if you will. Believe me——"

"Did you ring, my lady?"

"No," said Cora, quickly and sharply, turning round to meet the evil look of Marks' blue eyes, while Lord Almane rapidly raised his head.

As the servant disappeared, with a humble, "I beg your ladyship's pardon," Cora uttered an angry exclamation.

"If I had rung, it is not that man's place to answer the bell," she muttered, angrily.

But the man's entrance had effectually broken the thread of the conversation, and it was difficult to join it again.

"Do you remember long ago offering to be my friend?" said Lord Almane, softly, "and what I answered you then? Ah! we are older and wiser now, Cora; and if you will give me your friendship, I will prize it greatly. Is it mine?"

"It is yours," said Cora, frankly, putting out her hand. The Viscount took it, and was about to put it to his lips, when the door opened suddenly, and Alan entered.

"An unexpected pleasure, my lord," he said, bowing, but appearing not to notice the hand Lord Almane offered him. "Have you some tea for me, Cora?"

It was impossible to ascertain from his manner whether Sir Alan had noticed the quick start of his wife and her companion at his entrance, or the rapid unclasping of the two hands which had met so frankly. His manner was quiet and pleasant, and he spoke in his usual way.

"I thought you were at Richmond, Alan?" his wife said, as she gave him some tea.

"I did not go," he replied, shortly; "you see I am here."

Shortly after, Lord Almane took his leave, and Sir Alan and his wife were alone. Cora a little apprehensive, if the truth were known.

"Have you any objection to go Paris at this dull season, Cora?" said Sir Alan, suddenly. "They have a new statue at the Louvre I am most anxious to see. Are you afraid of the heat?"

"Not for myself a bit, Alan, but for Harold."

"Oh! we'll send Harold and the nurse down to The Bungalow."

"And this house?" said Cora, a little surprised.

"Leave the servants on board wages. You will take your maid of course? Marks shall be courier and general factotum, and we will have a second honeymoon, sweetheart. What say you?"

"That I shall be charmed," she said, gayly. "When do you mean to start, Alan?"

"As soon as you like, wife, and the sooner the better. You really like to come, Cora?"

And he put his hands upon her shoulders and looked searchingly into her face.

Cora felt that the blood rose in her cheeks, but she lifted her eyes to his unflinchingly.

"Anywhere with you, Alan," she said, sweetly; and her husband bent and pressed his lips almost roughly to hers.

He turned and left her, but, returning in a few moments, appeared to have already altered his mind concerning the journey to Paris.

"On second thoughts, Cora, I think we won't start quite yet," he said. "I have business which will keep me in town some time longer. You'll say I am very changeable, almost as changeable as a woman, Cora!"

And though Cora forced herself to return his smile, she felt her heart sink with a foreboding of evil.

July and August passed uneventfully for Cora. All the fashionables had deserted London for various summer resorts, but Sir Alan chose to remain in town, and Cora, as a dutiful wife, remained with him, although she had scarcely an acquaintance left in the metropolis, and she was consequently much alone. Harold had been sent down to The Bungalow, so that even the amusement and companionship of her boy were denied to her just now. At any other time she might not have felt this; but Sir Alan seemed much occupied, and there was a strange alteration in his manner towards his wife which puzzled her at times, and made her anxious and unhappy. It was not that his words were less affectionate, or his caresses less frequent; but they had now a certain coldness and restraint which struck upon the young wife's sensitive heart, and caused her own manner to be less frank and spontaneous. She knew that her husband was as kind and indulgent as ever, but she felt that some shadow had fallen upon the old, sweet companionship.

Lord Almane still lingered in London, and was a constant guest at Rivington Square. Cora received him with a cordial frankness betokening the friendship she had offered him, but which was anything but pleasing to the Viscount, although he seemed to accept his position frankly enough, and abstained from reminding Lady Vincent of the old intimacy. Sir Alan, whenever he appeared in the drawing-room during his lordship's visits, was courteous and pleasant, but their meetings were not frequent; and as the Viscount and Cora were generally alone, he was at liberty to entertain her with his regrets for a misspent past, his hopes and aspirations for the future; and he talked with that sad bitterness and mournful self-reproach which has a certain charm for a woman, especially one who was not quite happy.

On the whole, his visits were not displeasing to Cora, and she gave herself up freely to the pleasure she felt in their intercourse. She loved her husband too truly to dream of wrong to him; and it seemed as if Sir Alan had banished his besetting sin, for he showed no annoyance at the constant visits.

But it was not so, for the baronet was a prey to a passionate jealousy which he had tried vainly to combat. He told himself that Cora was true and noble, and that she loved him; but notwithstanding all his efforts, that demon, the "green-eyed monster," had obtained firm hold upon his heart, and although he appeared so outwardly calm and cool, he was suffering acutely.

Why, urged the tormentor, did Cora keep her acquaintance with Lord Almane a secret from him? Why had she turned pale, and seemed so much moved on that first day when they had met? Why had both started, and seemed embarrassed, on his sudden and unexpected appearance in the drawing-room? He would not doubt her, he said to himself, passionately; and yet he was doubting her with all his heart. It seemed to him that almost daily Marks' quiet face appeared at his studio door with, "Lord Almane is in the drawing-room, Sir Alan." Or when he returned from his club, in reply to his question, "Has any one called for me, Marks?"—"No, Sir Alan; no one has been here except Lord Almane."

Then, too, he noticed that Marianna had seemed annoyed and anxious at being sent with the child, whom she worshipped, and his nurse, to The Bungalow; and Cora had told him that the old Italian had wished her to accompany them thither.

Could it be that Marianna, who had lived at The Tryst, and been with Cora from her childhood, knew of that old friendship, and distrusted it? Sir Alan was a proud man; but his ruling passion was strong upon him now—so strong that he rode over to The Bungalow, and when he found himself alone with Marianna, he mentioned his lordship's name, and asked the old *cameriaria* concerning him.

"I know but little of Milord Almane," she replied, calmly. "He stayed at Richmond with my young master once, having met with an accident at our door. But, signor, I do not like him—I do not trust him. Do not do so either, signor," she added in a moment. "Ah! do not forget that the signora is very beautiful, and very innocent."

She concluded abruptly; but Sir Alan could not obtain any further information from her, and he returned to town with his belief strengthened—almost confirmed.

The next day Sir Alan told Cora that she must prepare for the intended visit to the French capital; and she gladly obeyed, hoping to win back the old love and trust when they were alone. And during the first few days it seemed as if she succeeded, for, freed from Lord Almane's presence, the baronet gave himself up frankly to his real love for Cora; and she hoped and believed that whatever the cloud had been it had passed away.

But it was not so. The cloud was but gathering, and, when it burst, the storm would be a terrible one, almost overwhelming her with its violence. [1]

CHAPTER XVIII.

The month of September is a lovely one in Paris, and residents and strangers look upon it as one of the most agreeable seasons in that favored city. The Parisian grandees come back then from their season at the *eaux* or their country houses, and the closed shutters are reopened, the boulevards resume their brilliant appearance, the

THE TRIAL TRIP.

Champs Elysees become thronged with gay promenaders and brilliant equipages, which contrast with the *fiacres* and tourists who have had it all their own way there during the hot months of July and August.

In a handsome sitting-room at one of the principal hotels in Paris, situated in the Boulevard des Capucines, lounges Lord Almane, carolessly glancing over the Times, impatiently turning now and then to look at the French time-piece, with which the mantel-piece is adorned, and betraying sundry signs of *ennui*. The remains of his late breakfast were upon the table, but he did not summon a servant, and seemed in expectation of a visitor, for when his valet appeared with the information that a person was inquiring for his lordship, he said, eagerly:

"Show him in at once."

Two minutes elapsed, when the door was again opened, and a tall man, with a pale face and deep-set blue eyes, was ushered in. He bowed respectfully to the Viscount, but did not speak, until the atter addressed him. Lord Almane nodded carelessly, and began:

"Well, Marks, what news this morning?"

"There is none of any importance, my lord," replied Sir Alan's servant, for it was he. "Sir Alan and my lady are gone to the Louvre."

"Does Sir Alan know that I have arrived?"

"I believe not, my lord," was the quiet reply. "But I told Lady Vincent's maid that your lordship was in Paris, and she repeated it to her ladyship."

"Who will, of course, tell her husband," said the Viscount, a little impatiently.

"I think not, my lord; although, since their rrival in Paris, Sir Alan has resumed his former devotion to my lady."

The man's voice was quiet, monotonous and indifferent; but the light blue eyes told a tale of eager, cruel resentment, and the Viscount's velvety dark orbs read it clearly enough.

A slight shadow passed over the handsome face of the young nobleman.

"But," went on Marks, "the seed sown in Sir Alan's heart will bear fruit, my lord. He distrusted his wife once, he will do it again; and Lady Cora is too proud to bear suspicion."

"You owe your master a grudge, methinks," said the Viscount, smiling. "Why is it, Marks?"

"That is my secret, my lord," the man answered, quietly, but not disrespectfully.

"Her ladyship is a devoted wife," remarked the nobleman, in a few moments.

"Very much so," was the reply; "but her ladyship is proud and passionate; Sir Alan is jealous and equally passionate. If two such natures clash, my lord, they are not easily reconciled, for Lady Cora will stoop to no explanations, and if she would Sir Alan would listen to none."

"You are a deep student of character, Marks," remarked Lord Almane, smiling. "Did you say that they were at the Louvre this morning? Tell my man, as you go down, to call a *fiacre*, will you?"

And the Viscount gave a cool nod of dismissal, which the other returned with a low bow, as he went away; and in a few moments Lord Almane was driving along the boulevard towards the Louvre.

Although it was yet early when he reached it, there were many strollers about the long picture-lined galleries, and a tolerable number of artists were engaged in copying noted works of art. The Louvre was a well "beaten track" to Lord Almane, and he passed on indifferently through the sculpture-rooms, up the broad stone-steps, over the smooth, shining floors, until, through one of the galleries, he caught sight of a tall form—the figure of a man of unusual hight and grand proportions, with a graceful female form standing at his side. One glance sufficed to show him that they were those whom he sought; he turned round and moved quietly away in another direction.

"Yes, it is most beautiful, Alan," said Cora, softly, as they stood before Greuze's celebrated picture of the "Cruche Cassee." "I like Greuze's heads, they are so lovely, are they not?"

"You are not singular in your liking" said a musical voice at her elbow, and Sir Alan felt the little hand resting upon his arm give a convulsive start; and his own lips drew closer together over his set teeth as he turned to greet Lord Almane.

"I did not anticipate such an agreeable surprise," continued the Viscount. "How long have you been in Paris, Lady Cora?"

"A fortnight," she replied, in a low tone.

"And your stay will be a long one?" he said.

"Our movements are uncertain," replied Sir Alan, coldly. "Look Cora, this is the Claude I wanted you to see. Look at the effect of that sunset on the hills. Is not that perfect?"

"Perfect, indeed," answered the Viscount, who saw that Cora could not speak, and hastened to reply for her. "Nothing beats the Claudes, to my mind, in the Louvre."

"Are you ill, Cora?" said her husband, suddenly, but without the slightest tenderness in his voice. "Would you like to return to the hotel?"

"Yes, if you will get me a *fiacre*, Alan," she said faintly. "Don't let me take you away."

"Will yot accept my escort, Lady Cora? I was just thinking of leaving the museum when I met you. These picture-galleries are very tiring, are they not?"

"Are you sure that it will not be taking you away, Lord Almane?" said Alan, coldly. "If not, I shall be glad if you can return to the hotel with Lady Vincent. I happen to have important business with one of the head officials here."

Lord Almane quietly expressed his willingness, and Sir Alan accompanied his wife down to the entrance, called a passing *fiacre*, and assisted her to enter. She was pale and trembling still, but as he was about to relinquish her hand she clasped his in both her own.

"Can you not come with me, Alan?"

"Certainly, if you wish it;" and with a hasty apology to the Viscount, they drove away together, while Lord Almane returned to his hotel not on the whole displeased at the result of the morning's work.

"Did you know Lord Almane was in Paris, Cora?" was all Sir Alan vouchsafed to say during the few minutes which elapsed as they drove from the Louvre to the hotel bearing the same name where they were staying.

"Yes," she answered, faintly, for she felt that her hope of peace was over now, and that it was the presence of the Viscount which had caused the change in Sir Alan's manner.

"You seem nervous," he said, quietly, as they reached the sitting-room. "Will you have any advice Cora?"

"Oh, no," and she tried to laugh. "I shall be all right in an hour or two. Don't let me detain you, Alan."

And as he went away Cora threw herself upon a sofa and burst into tears. Her position was a difficult one and she felt it to be so. Her husband had never even hinted at any jealously of Lord Almane, but there was no other reason for his coldness; and unless the Viscount could be got to discontinue his visits and intercourse, a breach would be made between them which could never be filled up. And yet, how could she tell Lord Almane that her husband had not perfect trust in her? How could she let him know the doubts by which Sir Alan degraded himself and her? She was powerless, and her only chance consisted in the utmost circumspection and careful avoidance of Lord Almane.
—[To be continued.

RECENT LITERATURE.

France and the United States; their present Commercial Relations considered with reference to a Treaty of Reciprocity. Comprising Papers by M. MENIER, LEON CHOTTEAU, PARKE GODWIN and J. S. MOORE. New York: G. P. Putnam's Sons. Price 25 cts.

THE energetic policy pursued by Secretary Evarts in the matter of collecting information respecting the exact state of our trade with foreign countries and the trouble he has been at to devise means for increasing the same; the visit to this country of the French Committee who have in view the establishing of a commercial reciprocity treaty between France and the United States, and the discussion of the "Wood Tariff Bill" have all combined to keep the question of our trade relations with foreign countries before the people for several months and to foster an interest in the subject—and a work having any bearing on the question is likely to have a large circle of readers.

The little manual noticed above is published under the auspices of the New York Free Trade Club and is full of suggestive facts and figures. We quote from M. Menier:

"In 1816, as in 1865, the Americans committed a great commercial mistake; they wished by raising their tariff rates to make foreign nations pay the debts of the United States. What was the result? That foreign commerce deserted them. Then a certain number of manufacturers said, 'So much the better! From foreign competition we can be independent; we shall produce all that we need; we shall no longer pay foreign tribute.'

"But the crises through which the United States are now passing, the strikes which have taken place, should prove to all the dangers of such a system. Products are exchanged for products. Such is the economic law. When a market is closed to foreign products, foreign commerce deserts it. The foreign nation in its turn retaliates by similar restrictions. Instead of a union of interests, there is a war of interests. Then home products finding no outlet, glut the market; the consequences are plethora and crises. This is what is taking place in the United States. Instead of applying themselves to the production of cotton, coffee, wheat, tobacco, meat and precious metals, they wished to compete with the whole manufacturing interests of Europe; hence the crises and the failures from which New York has perhaps suffered most.

"They wished to protect silk by a tariff of sixty per cent., aggravated by Custom House red tape. Has the silk industry prospered in the United States? Did not the great manufacturer of Newark threaten, a few months ago, to close his establishment, or to reduce the salaries of his workmen fifteen per cent.?

"In the United States, twenty miles from St. Louis, are mountains of iron ore; yet for the last three years the production of iron has steadily diminished:

1873	2,868,000	tons.
1774	2,689,000	"
1875	2,266 000	"
1876	2,050,000	"

"Why? Because cast iron costs about fifty-four francs more than in Europe; the raw products, the workmen, the freight charges, having all been benefited by the protective tariff. Then the demand stopped. The United States also wished to protect the merchant marine; and they, who have splendid harbors, superb rivers and an immense coast line, and cotton, wheat, woods and metals to export, built last year twenty-five steamers, of a capacity of 21,000 tons, while England built 719 sailing vessels and 348 steamers, of a capacity of 473,000 tons. Such facts are significant."

Leon Chotteau, in reviewing the history of the changes in our tariff, says:

"The eight years of war nearly ruined the United States, and Washington in 1790 thought best to ask from Congress a protective tariff. Until 1816 the duties were reasonable. In 1816 there was a sudden rise in the rate of custom duties; the war of 1812 with England exhausted the treasury, and foreign commerce was obliged to make up the deficit. In 1832 the national debt was very nearly wiped out. At the proposal of Henry Clay it was decided that every duty of more than 20 per cent. *ad valorem*, should be reduced from year to year, until this uniform rate was reached. Toward 1840, began the agitation which has been called the tariff war. Men like Mr. Carey of Philadelphia wrote books and pamphlets in favor of a vigorous system of protection. The high tariff of 1842 was the result of these efforts.

"In 1857 they went back to the tax of 20 per cent. But the South, four years afterward, rebelled against the North.

"When Lee surrendered to Grant at Appomattox Court House the Republican party by excessive custom duties tried to make manufacturing Europe pay the national debt. In serving the interests of the treasury it was the intention to show their strength to England who had armed the "Alabama," and to Bonaparte's government which had sympathized with the South. To be sure Thaddeus Stevens in the House of Representatives and Charles Sumner in the Senate Chamber were patriotically right in wishing reprisals. They made a mistake in thinking that by keeping away English and French commerce they would hurt England and France alone. When the duty rises from 4 or 5 per cent. to 50, 60 or 70 per cent., it is equivalent to prohibition and ceases to be levied because there are no goods to levy on. This is what has been lately shown in connection with the Lyons workmen. The Lyons exporters send very little silk to the United States; they suffer greatly and the American Custom House receives next to nothing from this quarter because it has been too greedy. Such is the situation.

"The English acted under a wiser inspiration. In 1826 they levied on silk a duty of only thirty per cent., and the innovation bore fruit so well that the manufacturers of Manchester complained in 1852 of being too much protected by this remnant of protection. They asked relief from the government 'by abolishing the duty on silk goods of foreign origin, not partially or gradually, but completely and immediately.'"

Mr. J. S. Moore shows that out of a total of $46,233,793 of exports to France during 1877 only 2,000,000 were manufactured goods, and it is to bring about a more satisfactory state of affairs for the exchange of manufactures that this Commission was organized.

The work concludes with an earnest appeal to the people of the United States to further the good work.

The Voyage of The Paper Canoe. By N. H. BISHOP. Boston: Lee & Shepard.

MR. BISHOP is a practised traveler, whose observations seem to have been in no way embarrassed by the difficulty of keeping above water in such a cranky affair as the paper canoe during a voyage from Quebec, along our rivers and coast, to the Gulf of Mexico.

Such a novel method of navigation made him the observed of observers of high and low degree, and his voyage was more or less triumphal from start to finish. Although escaping narrowly a number of times, he had but one ducking in the trip of 2,500 miles, but on that occasion, in Delaware Bay, crew, cargo and ship very nearly came to a period.

In South Carolina his journey was an ovation. Before leaving the state he spent a day with Gov. Aiken on his island home. We make room for a brief extract:

"As we sat together in that room, where in years gone by, Gov. Aiken had entertained his northern guests, my kind host freely told me the story of his busy life, which sounded like a tale of romance. He had tried to stay the wild storm of secession." * * For several years previous to the war his place yielded a net income of fifty thousand dollars. When the Union Army marched through another part of South Carolina, where the Governor had buried the old family heirlooms, and had added to the original plate $30,000 worth of his own purchasing, the soldiers dug up this treasure-trove. * * Thus was plundered an old and revered governor—one who was a kind neighbor, a true patriot, and Christian gentleman. His persecutions did not, however, end with the war. * * To-day, the governor's favorite sideboard stands in the house of a citizen of Boston, as a relic of the war. O, people of the North, hold no longer your relics of the war, stolen from the firesides of the South. Restore them to their owners, or else bury them out of the sight of your children, that they may not be led to believe that the war for the preservation of the Great Republic was a war for *plunder*;—else did brave men fight, and women pray in vain. Away with stolen pianos, 'captured' sideboards, and purloined silver. What but this petty plundering could be expected of men who robbed by wholesale the poor negro, to protect whose rights, they were sent South?"

Again: "A traveler should place facts before his readers, and leave to them the drawing of the moral. Northern men and women who go south and reside for even the short space of a year or two invariably change their life-long views and principles regarding the negro as a moral and social creature. When these people return to their homes in Maine and Massachusetts (as did the representatives of the Granges of the northern states after they had visited South Carolina in 1875), a new light, derived from contact with *facts*, dawns upon them, while their surprised and untravelled neighbors say: '*So you have become Southern in your views.* I never would have thought that of *you*.'"

Mr. Bishop is a native of Massachusetts.

The three hundred and fifty-one pages of the volume are replete with the results of careful observation and conclusions, while the easy and graceful manner of the narrative, added to the novelty of the manner of journeying, makes it impossible to find a dull page between the covers.

The Art of Sketching from Nature. New York: G. B. Putnam's.

THIS is the first of a series of art hand-books intended to aid and direct the artistic bent of those who, knowing nothing, are yet anxious to be taught. The conspicuous merit of the present treatise is its simplicity and clearness. There is a lack of confusing art jargon, and the author, Thos. Rowbotham, keeps ever before him the idea that if the untutored are to be taught the A B C of sketching from nature, it is essential not to take for granted that the learner is familiar with the letters; hence the explanations are lucid, and advance step by step, until the principles are distinctly set forth. Carefully mastered, the beginner cannot fail to secure a good foundation in the art, and his progress will thereafter depend on natural aptitude and practice. Sketching from nature affords the most lively enjoyment, and is the surest means of crystalizing the pleasantest reminiscences of travel. A sketch will more vividly bring to mind some bright episode of the past than a library of diaries.

The book is embellished with 27 illustrations explanatory of the text, and is in every sense complete. Miss Carter, Superintendent of the Cooper Union art schools is the American editor, and in her preface says: The books which make up this series are all by skillful painters, and the rules they lay down are safe and practical. The series will embrace in addition to the book under notice, Landscape Painting in Oil Color, Flower Painting, Figure Drawing, and an Artistic Treatise on The Human figure. The books thus far issued are sold at the uniform price of 50 cents, and are typographically charming.

The Phantom Wedding; or, the Fall of the House of Flint. By Mrs. E. D. E. N. SOUTHWORTH. [cloth: $1.75]; Philadelphia: T. B Peterson & Bros.

THIS is the title of a volume of 370 pages. One is attracted by its handsome binding and startling title—by the manifold names of the authoress and by its table of contents glistening with exclamation points and small-caps like the programme of the Old Bowery Theater, and braces his nerves to witness a dramatic performance of five thrilling sensational acts with accompanying tableaux, phantasmagoria and transformation scenes to slow music. It is a delusion and a snare!

The Phantom Wedding is after all but a short and very flimsy ghost story giving, like an attenuated godmother a name and a local habitation to some other short and flimsy stories which occupy 300 of those pages. The latter are from the pen of Mrs. Frances Henshaw Baden and bear a strong family likeness to their godmother. Some of these are: "Did He Win the Right One?" "Mary's Ghost"; "Was She True?"; "Almost a Crime," etc. The last not being, as one might hope, a remorseful exposition of the fraud which foists these waifs upon the cold world, but only a sentimental story of a young man—albeit of delicate sensibilities who was bribed by his mother—25c. being the amount used in this corrupt transaction—to drown a cat. Fortunately the vena youth, having secured the quarter in advance, was spared the commission of the "crime" simply from the fact that the feline having suffered the discomfort of losing one of its nine lives returned to relieve his conscience and suggest the possibility of another quarter in the near future. It seems difficult to believe that these trashy stories were written for grown people and yet they cannot but be considered most unwholesome reading for the young.

Suffrage in Cities. By SIMON STERNE, New York: G. P. Putnam's Sons. Price 25 cents.

MR. STERNE is well known as an able lecturer in the interest of reform and pure government. The above named discourse, delivered at Cooper Institute in December last, is devoted to an exposition of the evils consequent on universal suffrage as applied to cities. In all cities of this country the great bulk of taxes is paid by the property-holders who are in small proportion to the number of inhabitants. The large majority of the voting population consisting of persons holding little or no property, who for the most part are ignorant, thriftless, idle and unworthy, and can have but little interest in the administration of the municipal government. These masses are controlled by designing and unscrupulous adventurers to serve their ends. They manipulate the political machine for them and direct their votes as they wish. The intelligent middle classes cannot affect the result of a municipal election one iota—they are practically disfranchised, they have no representation. "All public robbers and tyrants extend the suffrage with a view of striking centers of ignorance and prejudice upon which they can base their power, so as to be independent of the intelligent middle class which has always been the conservator of liberty, and the safety of the State." Mr. STERNE earnestly advocates a property qualification or other just limitation of the suffrage, by legislation or, failing in this, a fair and equitable minority representation. No one in the field of lectures is more conversant with the subject or better qualified to instruct.

Two Ways to Matrimony; or, "Is this Love?" Philadelphia: T. B. Peterson & Bros. Paper 50cts.

HERE we have a moral pointed by an unknown author for "Young ladies and gentlemen, as well as for mothers, for fathers and for all those contemplating matrimony or in wedlock." The two ways are indicated, one by a worldly-minded and frivolous mother who educates her daughters according to her superficial notions of usefulness—the usefulness of girls qualified to marry an "establishment" and the other by the mother whose daughters are brought up with a view to self-helpfulness and the domestic virtues. The same financial crash impoverishes both families and while the members of the one—still wedded to their idols, endeavor in their country home to impress the simple country folks with their pretensions and display; those of the other utilize their solid accomplishments and live simply, comfortably and respected by all. There is the conventional Baron, who is only a gambler and adventurer, marries (under the impression that she is an heiress) a superficial daughter of the frivolous mother, who is dazzled by his title and supposed wealth, opens a gambling house, and finally commits suicide. A number of virtuous young men marry the daughters of the correct family and live happily ever after. It is the old story of the punishment of pride and the reward of virtue, and the plot is too thin and the incidents too vapid to invest it with any new interest.

BRIC-A-BRAC.

WANTED.

SPOKES for the ladder of fame.

TEETH for the mouth of a river.

GLOVES for the hands of a clock.

MOLD for growing flowers of speech.

ELECTRICITY for thunders of applause.

A HANDKERCHIEF for the weeping-willow.

THE OLDEN LOVE.

Now to thy waiting arms
I come, my olden love,
As oft and oft to prove
Once more thy soothing charms.

Against thy faithful breast
I press my aching brow;
A lethean solace now
Creeps o'er me, and I rest.

All shadowing of regret
For what has been, must be,
All pain, all care, in thee
I'll for a while forget.

No converse shall be ours,
But silence calm and deep,
Like that when white stars keep
Still watch through midnight hours.

So mutely, best, thou'lt share
My burdens, friend long proved,
Long cherished, and long loved—
My dear old easy chair.

[*Boston Transcript.*

NOT A MARRYING GIRL.

THEY were seated together, side by side, on the sofa, in the most approved lover fashion—his arm encircling her taper waist, etc.

"Lizzie," he said, "you must have read my heart ere this; you must know how dearly I love you."

"Yes, Fred; you have certainly been very attentive," said Lizzie.

"But, Lizzie, darling, do you love me? Will you be my wife?"

"Your wife, Fred! Of all things, no! No, indeed, nor any one else's."

"Lizzie, what do you mean?"

"Just what I say, Fred. I've two married sisters."

"Certainly! and Mrs. Hopkins and Mrs. Skinner have very good husbands, I believe."

"So people say; but I wouldn't like to stand in either May or Nell's shoes, that's all."

"Lizzie, you astonish me,"

"Look here, Fred; I have had over twenty-five sleigh rides this winter, thanks to you and my other gentleman friends."

Fred winced a little here, whether at the remembrance of that unpaid livery bill, or the idea of Lizzie's sleighing with her other gentlemen friends I cannot positively answer.

"How many do you think my sisters have had? Not the sign of one, either of them. Such pretty girls as Mary and Nellie were, too, and so much attention they used to have!"

"Now, Lizzie—"

"I am fond of going to the theatre occasionally as well as a lecture or concert sometimes, and I shouldn't like it if I proposed attending any such entertainment to be invariably told that times were hard and my husband couldn't afford it, and then to have him sneak off alone."

"Lizzie, Lizzie—"

"And then if once in a dog's age he did condescend to go with me anywhere in the evening, I shouldn't like to be left picking my way along the slippery places, at the risk of breaking my neck, he walking along unconsciously by my side. I am of a dependent, clinging nature, and I need the protection of a strong arm."

"Lizzie, this is all nonsense."

"I'm the youngest in our family, and perhaps I've been spoiled. At all events, I know it would break my heart to have my husband vent all the ill-temper which he conceals from the world on my defenceless head."

"But, Lizzie, I promise you that I—"

"Oh, yes, Fred; I know what you are going to say—that you will be different; but Mary and Nell have told me time and again that no better husbands than theirs ever lived; no, Fred, as a lover, you are just perfect, and I shall hate awfully to give you up. Still, if you are bent on marrying, there are plenty of girls who have not married sisters, or who are not wise enough to profit by their example, if they have. And don't fret about me, for I've no doubt I can find some one to fill your place—"

But before Lizzie had concluded, Fred made for the door, muttering something "unmentionable to ears polite."

"There!" exclaimed Lizzie, as the door closed with a bang. "I knew he was no better than the rest. That's the way John and Alcck swear and slam doors, when things don't go just right. He'd make a perfect bear of a husband, but I'm sorry he came to the point so soon, for he was just a splendid beau."

IN THE APPLE-TREE.

RIGHT into the heart of it,—why Robin!
Why, didn't you know that the apple-tree,
When she gets her wonderful, fragrant blows,
Is a real spring-angel in white and rose?—
(Now hear him singing to mock at me!)

Why your nest is in there, you darling Robin,
And your little brown lady is in there too,—
Faith! you've an exquisite bridal-room,
With a ceiling frescoed, in rosy bloom,
Upon a ground of celestial blue.

Here's to your health, you blessed Robin,
And the next best thing it must surely be
To being an angel in bliss above,
To live with your little ones and your love,
In the heart of a blossoming apple-tree.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

BEAUTIES OF ENGLISH LITERATURE.

A PRETTY deer is dear to me,
A hare with downy hair,
A hart I love with all my heart,
But barely bear a bear.

'Tis plain that no one takes a plane,
To have a pair of pears,
Although a rake may take a rake
To tear away the tares.

Sol's rays raise thyme, time razes all,
And through the whole holes wears.
A scribe in writing right may write
To write and still be wrong;
For write and rite are neither right,
And don't to right belong.

Robertson is not Robert's son,
Nor did he rob Burt's son,
But Robert's sun is Robin's sun,
And everybody's sun.

Beer often brings a bier to man,
Coughing a coffin brings,
And too much ale will make us ail,
As well as other things.

The person lies who says he lies
When he is not reclining;
And when consumptive folks decline,
They all decline declining.

Quails do not quail before a storm,
A bough will bow before it;
We cannot rein the rain at all,
No earthly power reigns o'er it.

The dyer dyes awhile, then dies—
To dye he's always trying:
Until upon his dying bed
He thinks no more of dyeing.

A son of Mars mars many a son,
All Deys must have their days;
And every knight should pray each night
To Him who weighs his ways.

'Tis meet that man should mete out meat—
To feed one's fortunes sum;
The fair should fare on love alone,
Else one cannot be won.

Alas, a lass is sometimes false,
Of faults a maid is made;
Her waist is but a barren waste—
Though stayed she is not staid.

The springs shoot forth each spring and shoots
Shoot forward one and all;
Though summer kills the flowers, it leaves
The leaves to fall in fall.

I would a story here commence,
But you might think it stale;
So we'll suppose that we have reached
The tail end of our tale.

[*Louisville Railway Mail.*

EXTRACTS FROM "WIFE TORTURE IN ENGLAND."

BY FRANCES POWER COBBE.

WHAT reason can be alleged why the male of the human species should be the only animal in creation which maltreats its mate, or any female of its own kind?

With the exception, perhaps, of the seal, Mr. Darwin gives a sad picture of amphibious conjugal life: "As soon as a female reaches the shore ('comes out,' as we should say in 'society'), the nearest male goes down to meet her, making meanwhile a noise like the clucking of a hen to her chickens. He bows to her and coaxes her, until he gets between her and the water so that she cannot escape him. Then his manner changes, and with a harsh growl he drives her to a place in his harem" ("Descent of Man," vol ii., p. 269.) What an "o'er true tale" is this of many a human wooing and of what comes later; the "bowing and coaxing" first and the "harsh growl" afterward! I am surprised Mr. Darwin did not derive from it an argument for the descent of man from the seal.

It is very instructive to watch the behavior of a big male dog undergoing the experience which is understood to surpass the limits of a man's endurance; namely being "nagged" by a little vixen who stands opposite to him in an attitude exactly corresponding to the the "arms akimbo" of her human prototype, and pours out volleys of barking which would obviously, in the police courts be reported as "abusive language." The much-tried dog—let us say a retriever or Newfoundland—who could annihilate his little female assailant—a toy terrier or Pomeranian, perhaps—in two mouthfuls, and who *would* do so in the case of an enemy of his own sex—always on these occasions starts aside with well-feigned surprise, as if astonished at the reception of his advances; lifts his ears as a gentleman raises his hat, and presently bounds away lightly: "I beg your pardon, madam. I am the last dog in the world to offend a lady!" Be it noted that if that dog had retreated before the bullying of another male dog, he would have slunk off with his tail between his legs, ashamed of his own poltroonery. But from the female termagant he retires with all the honors of war, and with his tail held aloft like a standard; quite conscious that he is acting as becomes a dog and a gentleman.

* * * * * * *

Wife-beating exits in the upper and middle classes rather more, I fear, than is generally recognized; but it rarely extends to anything beyond an occasional blow or two of a not dangerous kind. In his apparently most ungovernable rage, the gentleman or tradesman somehow manages to bear in mind the disgrace he will incur if his outbreak be betrayed by his wife's black eye or broken arm, and he regulates his cuffs or kicks accordingly. The dangerous wife-beater belongs almost exclusively to the artisan and laboring classes.

* * * * * * *

I have no intention in this paper to discuss the vexed subject of women's political and civil rights, but I cannot pass to the consideration of the incidental and minor causes of the outrages upon them, without recording my conviction that the political disabilities under which the whole sex still labors, though apparently a light burden on the higher and happier ranks, presses down more and more heavily through the lower strata of society in growing deconsideration and contempt, unrelieved (as it is at higher levels) by other influences on opinion. Finally, at the lowest grade of all, it exposes women to an order of insults and wrongs which are never inflicted by equals upon an equal, and can only be paralleled by the oppressions of a dominant caste or race over their helots. Man alone claims to hold his mate in subjection, and to have the right while he lives, and even after he dies, to rob a mother of her child; and man, who has lost the spontaneous chivalry of the lion and the dog, needs to be provided with laws which may do whatever it lies with laws to effect, to form a substitute for such chivalry. Alas! instead of such, he has only made for himself laws which add legal to natural disabilities, and give artificial strength to ready-constituted prepotence.

* * * * * * *

When I read all the fine-sounding phrases perpetually repeated about the invaluable influence of a good mother over her son; how the worst criminals are admitted to be reclaimable if they ever enjoyed it; and how the virtues of the best and noblest men are attributed to it, as a commonplace of biography—I often ask myself: "Why, then, is not something done to lift and increase, instead of to depreciate and lower, that sacred influence? Why are not mothers allowed to respect themselves, that they may fitly claim the respect of their sons? How is a lad to learn to reverence a woman whom he sees daily scoffed at, beaten, and abused, and when he knows that the laws of his country forbid her, ever and under any circumstances, to exercise the rights of citizenship; nay, which deny to her the guardianship of *himself*—of the very child of her bosom—should her husband choose to hand him over to her rival out of the street?"

The general depreciation of women *as a sex* is bad enough, but, in the matter we are considering, the special depreciation of *wives* is more directly responsible for the outrages they endure. The notion that a man's wife is his PROPERTY, in the sense in which his horse is his property (descended to us rather through the Roman law than through the customs of our Teuton ancestors), is the fatal root of incalculable evil and misery. Every brutal-minded man, and many a man who in other relations of life is not brutal, entertains more or less vaguely the notion that his wife is his *thing*, and is ready to ask with indignation (as we read again and again in the police reports), of any one who interferes with his treatment of her, "May I not do what I will *with my own?*" It is even sometimes pleaded on behalf of poor men, that they possess *nothing else* but their wives, and that, consequently, it seems doubly hard to meddle with the exercise of their power in that narrow sphere!

* * * * * * *

Stripped of the euphemisms of courtesy wherewith we generally wrap them up, it cannot be denied that the sentiments of a very large number of men toward women consist of a wretched alternation of exaggerated and silly homage, and of no less exaggerated and foolish contempt. One moment on a pedestal, the next in the mire; the woman is adored while she gives pleasure, despised the moment she ceases to do so. The proverbial difficulty of introducing a joke into the skull of a Scotchman is nothing to that of getting into the mind of such men that a woman is a *human being*—however humble—not a mere adjunct and appendage of humanity; and that she must have been created, and has a right to live, for ends of her own, not for the ends of another; that she was made, as the old "Westminster Catechism" says, "to glorify God and enjoy Him forever," not primarily or expressly to be John Smith's wife and James Smith's mother. We laugh at the great engineer who gave as his opinion before a royal commission that rivers were created to feed navigable canals; and a farmer would certainly be treated as betraying the "bucolic mind" who avowed that he thought his horse was made to carry him to market, and his cat to eat his mice and his cheese; yet where women are concerned—beings who are understood to be at least *quasi*-rational, and to whom their religion promises an immortal life hereafter of good and glory—the notion that the "final cause of woman is man," seems never to strike them as supremely ridiculous.

* * * * * * *

The Rev. F. W. Harper, writing to the Spectator of January 26th, says, "I make bold to believe that if ever I should turn into a wife I shall choose to be beaten by my husband to any extent (short of being slain outright), rather than it should be said that a stranger came between us." After thus bringing to our minds the beatings, and kickings, and blindings, and burnings, and "cloggings," which sicken us, he bids us remember that the true idea of marriage is "the relation of Christ to his Church!" It is not for me to speak on this subject, but I should have expected that a minister of the Christian religion would have shuddered at the possibility of suggesting such a connection of ideas as these notions involve. Heaven help the poor women of Durham and Lancashire if their clergy lead them to picture a Christ resembling their husbands!—*British Quarterly Review.*

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

MRS. G.—Your lawn will look pretty trimmed with torchon lace; or if you prefer a novelty, I would suggest colored embroidery. In blue you can get tasteful designs for 25 cents per yard.

MISS TEEJON, Otsego County, N. Y.—A tolerably good quality of kid glove can be purchased for 50 cents. Of course, these gloves are inferior in finish and in shape, but still they are serviceable for second best. The much advertised lisle-thread gloves with openworked wrists, are very pretty—in boxes at the store counter, but have a most slovenly effect on the hand. A lisle-thread glove to be at all presentable, should fit the hand as snugly as possible, and as the openwork does away with buttons, there is nothing to draw the gloves into shape and they hang loosely around the wrists reminding the beholder of the tidy effect produced by stockings down at the heel.

MRS. LESTER, Racine, Wis.—I would strongly recommend you to purchase a bourette grenadine. The prettiest styles come in grey, dashed with some bit of bright color. They retail at 30 cents per yard, and are unusually wide. The objection to cheap black grenadine is that they so soon become rusty-looking, and when once they've lost their pristine blackness they are the most dejected looking of fabrics, and give the wearer an air of shabbiness.

MISS LAURA STOCKTON, Shelter Island.—Passably good stockings are offered as low as 25 cents per pair, one firm selling one-half dozen pair regular made for $1.00; but of course this class of goods is not to be compared, in appearance with those which command higher prices. A beautiful quality of balbrigan stockings, extra long, with silk clocks, is sold at 43 cents per pair. Fancy colored stockings bring fancy prices. Some designs are very beautiful, whilst others are correspondingly ugly. Lisle thread come at $1.18 per pair. Dainty openworked stockings can be had at 80 cents per pair; but as durability is not one of their characteristics, they are a rather expensive investment for those who can't afford to indulge in "pedal" extravagances.

JENNIE LEE, Berkshire Hills, Mass.—All white hats are very much worn, but unless one has an exceptionally good complexion they are extremely unbecoming; and beside, they are so "dressy" as to require a handsome costume throughout. A cheap dress fabric, however tastefully made, is not a suitable "accompaniment" for a white hat, unless the hat is trimmed with Quaker-like simplicity.

HATS AND BONNETS.—So many inquiries about head-covering have been received that I've decided to give an illustrated article on fashionable millinery in our next issue, and answer all the fair querists at one time.

COMODONES OR BLACK WORMS.—The presence of these indicates a lack of activity in the skin. Turkish or sulphur baths are beneficial in removing all impurities of the skin, and where these are not obtainable, an ordinary sweat bath is a tolerably good substitute. Washing the parts affected with white castile soap, allowing the soap to dry on it is recommended, as is also a wash of 36 grains of sub-carbonate of soda in eight ounces of distilled water, perfumed with six drachms of essence of roses. Another remedy which must be used with great care, is to touch the head of each worm with a fine hair pencil dipped in acetic acid. Pimples, worms and all skin disfigurements are the result of ill health, improper diet or of impure air. The skin is very sensitive to such influences, and physical sickness or mental depression make sad havoc with the complexion.

NAPOLEON AND MME. RECAMIER.

How very small and very contemptible this great fighting man could be is exemplified in his conduct to Mme. Recamier, which even exceeded in baseness his persecutions of Mme. De Stael. The first time his eyes fell upon her she incurred his jealous anger. It was in the court of the Luxembourg, on the occasion of the great reception given him by the Directory to celebrate his Italian victories. While Barras was delivering a long oration, she rose from her seat to obtain a better view of the hero of the day. Clad in simple white, her invariable costume, her wonderful beauty immediately attracted all eyes, and a murmur of admiration ran through the assembly. Bonaparte glanced sharply round to ascertain the cause, and his eyes fell upon that lovely form. Indignant that even a woman should for an instant distract the admiring gaze from him, he cast upon her a glance so stern that she sank back into her seat overwhelmed with confusion. From that hour he became her enemy. Being present at the trial of General Moreau, he demanded so angrily "What was Mme. Recamier doing there?" that she was counseled by her friends, if she had any regard for her safety, not to attend a second day. Yet the jealous despot was no more insensible to her charms than were other men.

It was at a ball given by Lucien that she met him for the second and last time. She observed his eagle glance following her every movement, and presently Fouche came up to her and whispered in his bold, insolent way, "*Madame, le premier consul vous trouve charmante!*" After the supper Napoleon himself addressed her brusquely with, "Why did you not come and sit by me at supper? You should have done so; it was your place." The great mogul or the sultan of Turkey could scarcely have been more dictatorial to a female subject. Through his vile agent, Fouche, he made overtures to her to take the post of dame du Palais. "He has never yet," said Sir Pandarus, "met with a woman worthy of him, and no one knows what would be the love of Napoleon for a pure-minded woman; she would assuredly obtain an influence over him which would be most beneficent." But Juliette Recamier's virtue was proof even against the allurements of this modern Zenguis Khan, and she shrank from all his advances; thereby, of course, incurring his deadly hatred, which became more or less extended, even to those who frequented her salons. Hearing that three of his ministers had been seen there, he demanded angrily since when the council had been held at Mme. Recamier's, and forbade them thenceforth to appear there. He said openly that he regarded as a personal enemy every person, whether French or foreign, who visited her.—*Belgravia.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

THE WASHING OF MUSLINS, CAMBRICS, WOOLENS, ETC.

In washing delicate, colored muslins and linens, several essential points must be observed if we intend preserving their original freshness and beauty. First, they should never be soaped or soaked. If not too soiled, wash in almost cold water; make a lather of good bar soap—white is best—and in it dissolve a small piece of alum: Use this dissolved soap in the water, and rub the goods with the hands, as far as possible. Put through two waters, and rinse in two more. A handful of salt or a spoonful of vineger in the rinsing-water, helps to brighten and hold the colors. Wash only one article at a time, and that very quickly. I have found that the blue figuros of prints and calicoes were rendered permanent by soaking them for a short time in strong salt and water—a pint of salt to two quarts of water. A piece of spermaceti an inch square, and a teaspoonful of salt, added to starch for muslins and linens, give to them a fino, smooth, glossy appoarance, and prevent the iron from sticking.

As soon as starched, hang in a shaded place—never in the sun—and iron immediately they are dry enough. A moderately hot iron only must be used, as many delicate pinks, buffs and greens, will change color as soon as a *hot* iron is placed over them. Brown linen may be kept looking like now, though repeatedly washod, if always washed in starch-water and hay-tea. For one dress, put a milk-pan of timothy hay on the stove, pour ovor hot water, cover, and boil until of a deep green. Make two or three quarts of flour-starch the usual way, and into it strain the hay-tea. Take about one-half of this mixture and add water, only enough to wet the dress in every part. Let soak ten minutes; add a little moro warm water, and rub through without soap. Rinse through more water than used in rubbing, with the starch and tea strained in; squeeze, snap, and hang in the shade to dry as quickly as possiblo. Small flannel garments for children may be whitened by first dipping into suds, wringing out, and hanging upon cords across the top of a barrol, with two or throe tablespoonfuls of flour-of-sulphur burning underneath. It may be necessary to repeat the prccess if very yellow. Care must be taken that the sulphur does not blaze and burn the articles. Hang in the air for a day or two; then wash and rinse in bluing-water. Scarlet flannel may be washed in warm suds, to which is added a quart of moderately thick flour-starch, and then rinse in warm water. A good method for washing woolen shawls is, to dissolve a pound of white soap in a little water, and boil down until like jelly. When cool, add three tablespoonfuls of turpentino, and one tablespoonful of strong spirits of ammonia. Wash thoronghly with this lather in enough water to wet it, and rinse until all the soap is out. Then put through salt and water, and hang up where it will dry at onoe.

Steuben Co. MARY B.

CLEANSING BEDS.

We have been renovating our hair mattresses this spring and finished tho last one yesterday. They look as good as now and I am pleased to say cost us nothing except our time and labor. The mattresses were ripped on three edges, the hair taken out, put on the grass, well pulled apart and beaten with long whips. The ticks were washed and ironed and the hair put back evenly. Then, with a long upholsterer's needle and strong twine tho mattresses wore tacked down tightly in diamonds the same as before, with a rosette of blue or red worsted tied in with each tacking. I found it rather difficult in the first one to spread the hair evenly. The mattross, when tacked, was high in the center and with scarcely any hair in the corners so that I was obliged to undo part of the work. Profiting by this experience, I had no difficulty with the second. MRS. E. B.

Cayuga Co.

THE CARE OF KEROSENE LAMPS.

Few illuminating substances produce a light as steady and brilliant as kerosene oil, but owing to inattention to certain requisite points its full brilliancy is rarely attained. The wick, oil and all the appurtenances of the lamp must be kept scrupulously clean; the burner polished; the chimney not only clean but bright and clear; the wick cut square across with *sharp* scissors. Those lamps which are made with immovable cupolas require especial care in cleaning and trimming, The upper part of a lamp frequently gets oily after standing for a time. This may, in a measure, be prevented by cutting a hole in a piece of felt so as to fit exactly around the socket into which tho burner is screwed. Trim the felt so that it will be abont one-half inch in width and place the ring on the socket. Housekeepers disregarding the above have, as a result, a flame dull, yellow, smoky, and half-lighted apartments at the same cost as those well lighted.

DOMESTIC RECIPES.

Delicious Pie.

Beat to a cream three-fourths of a cup of butter and one cup of sugar; add the well-beaten yelks of five eggs; flavor with vanilla. Line two tins with puff paste; pour in the mixture and bake at once. Beat the five whites to a stiff froth; sweeten with powdered sugar; flavor with vanilla and spread over the pies when done. Brown delicately and cut the pies while hot to prevent the eggs from falling.

One, Two, Three, Four Cake.

One cup of butter; two cups of sugar; not quite three cups of prepared flour and four eggs. If not wanted quite so rich, substitute cream for the butter.

Jumbles.

One pound of sugar; one pound of butter; two pounds of flour; three beaten eggs; one nutmeg; one teaspoonful of saleratus dissolved in a few drops of vinegar.

Pound Cake.

One pound of butter; one pound of sugar; one pound of flour and ten beaten eggs. Take half prepared and half unprepared flour.

River Edge, N. J. MISS LIZZIE VORHEES.

Cream Cakes.

One-half pint of boiling water; three-fourths of a cup of butter; one and one-half cup of sifted flour. Put in a saucepan over the fire; beat until very smooth and thoroughly scalded; set aside and when sufficiently cool add five well-beaten eggs. Drop this mixture, the size of a silver dollar, on buttered pans leaving a space of three inches each way. Bake thirty minutes in a hot oven, keeping the oven door closed as much as possible. When nearly cold, cut a slit three-fourths around the top of the puffs and fill with cream made as follows: Boil one pint of milk; add one cup of sugar; one-half cup of flour and two beaten eggs worked smooth in a little milk; boil ten minutes, stirring constantly. Flavor when done.

Sally Lunn.

Seven cups of sifted flour; one-half teacup of butter warmed in one pint of milk; three eggs; a little salt and two tablespoonfuls of brower's yeast — if baker's or home-made, use twice as much. Let rise six or seven hours.

New York City. MISS SUE MCCHAIN.

CORRECTION.—Miss CRONK'S recipe for preserved strawberries in the RURAL of May 11th, should have read three-quarters of a pound of sugar to a pound of fruit, and a pint of water to seven pounds of sugar instead of "three-quarters of a pound of fruit and a pint of water to seven pounds of sugar."

QUERIES ANSWERED.

WHAT will removo tho disagreeable taste from wooden bowls and pails?

YOUNG HOUSEWIFE.

ANS.—Try first, scalding thoroughly with boiling water; then wash with a solution of pearlash and lime and scald again.

WILL you please give a recipe for "planked shad?" MRS. KATE BRADY.

ANS.—Split the shad throngh the back, dress, wash, wipe dry, salt and tack skin down to a clean oak board with small nails. The board should be about two inches thick and heated *very* hot before tacking on tho fish. Place near an open fire with tho head down; as the juices run down, turn head up. It is important to turn frequently so as to retain the juices. When done, butter and serve on the board.

News of the Week.

NEWS OF THE WEEK.

ON Monday the 13th inst: the long-threatened attack on the President's title was begun by the democratic party in the lower House of Congress. Mr. Potter of New York, introduced a resolution based on Montgomery Blair's Maryland memorial, McLin's Florida confession and the charge of fraud in counting the electoral vote in certain parishes in Louisiana, and providing for a select committee of eleven to investigate the alleged frauds in both these States with authority to send for persons and papers and report at any time. Debate with regard to its admission was prevented by Speaker Randall, who, by a preconcerted agreement with its managers, ruled that it was a question of "privilege" on the ground that it related to the Presidential election. Mr. Hale of Maine, on behalf of the republicans, endeavored to amend the resolution so as to include all cases of fraud in any of the States. Neither amendment nor debate, however, was allowed by the democratic majority, nor would Mr. Potter even allow the proposed amendment to be read. Thereupon the republicans, denouncing the movement as intended for partisan campaign purposes, refused to vote, thus leaving the House without a quorum. A quorum of the House consists of 147 members who declare their presence by voting. When the vote was counted on this occasion there were only 116 yeas, and 1 nay. A subsequent count of the House showed 228 members present, but as the policy of the republicans forbade them to vote and so form a quorum hostile to themselves, the proceedings for the day abruptly terminated. The struggle continued for five days, the democrats daily gaining accessions to their numbers by the arrival of absent members who had been telegraphed for, and the republicans steadily adhering to their silent tactics whenever it came to a vote on the obnoxious resolution. At length, on Saturday the 18th, the democrats got their quorum and the Potter resolution was adopted by 145 yeas and 2 nays. Contrary to expectation the republicans made no attempt to filibuster and declined to ask for an investigating committee of their own on the ground that the scheme would tend still more to paralize business, prevent the restoration of confidence and reconciliation and Mexicanize this republic by throwing doubt on the title of its Executive. If the object of the movement is to oust Mr. Hayes, it is likely to be disastrous to the country; if to provide a basis for legislation to prevent future frauds, the inquiry should be made more general and much less partisan; if to make party capital for use in the fall canvass, it will be weakened by its one-sided character, limited scope and the cumbersome form in which its results must be presented to the public. In any case, it is hardly likely to bring about the punishment of the wretches who confessed to have directly perpetrated the frauds, and who, according to their own shameless avowal, reveal their rascality now merely because the administration refused to be frightened into giving them the petty offices they demanded as rewards for their turpitude. The "smelling" commitee will consist of seven democrats and four republicans and it is expected the report will be made in about sixty days' time.

The President says his title can only be questioned before the Supreme Court of the United States, that that Court would probably deny a writ of *quo warranto*, as the matter is in its discretion, and anyhow that he is resolved to maintain law and order at all hazards. Ex-Governor Packard of Louisiana has been nominated Consul at Liverpool, England, a fat berth where he may find consolation for his New Orleans failures while learning the duties which the present incumbent of the office has for years been faithfully discharging with universal satisfaction—another specimen of our vaunted Civil Service Reform. The President has sent to the Senate a message concerning the late award of $5,000,000 made to the Canadian Government by the Fishery Commission. He advises the payment of the sum, while a review of the controversy by Secretary Evarts, which accompanies the message, shows that the award does not accord with the questions submitted for arbitration. More than half the sum is to be paid to prevent the possibility of a slur being cast on our national character for fair dealing.

In the Pennsylvania coal regions eleven Molly Maguire murderers have already been hanged within the last year; two more are about to suffer the same well-merited penalty, and others are being sternly hunted down; yet the Society seems still to have a good deal of dangerous and revengeful life in it. A new organization called the "Kights of Labor" has been formed in Pennsylvania, and is said to number 200,000 men in the entire State, most of them foreigners, and like nearly all secret societies, it is producing considerable uneasiness among the people generally. The laboring classes in England and Germany and here are getting very restless, conscious that matters are not altogether right, yet without any definite idea as to the proper way to improve them. In this condition they are apt to fall easily under the leadership of blatant agitators who can suggest no way of bettering the condition of the poor except the destruction or partition of all wealth. Leveling down, not uplifting is the essence of their inflammatory harangues.

The Communist movement seems to be gaining headway here and there in the large cities. In St. Louis 5,000 men paraded the streets on Sunday, the 19th. Contrary to expectation, the demonstration passed off peaceably. In expectation of disorder, the police had taken all needed precautions, and most of the militia were under arms at their armories. In Cleveland, Ohio, members of the order are buying arms and ammunition. In San Francisco it has attained a dangerous extent, chiefly under a turbulent demagogue called Kearney. A split, however, has taken place in the faction there, the less disorderly party being for the time triumphant. Real estate has very considerably depreciated in the city on account of the fierce and blood-thirsty threats of the agitators; upwards of $20,000,000 that would have been invested there within the last few months, in quiet times, has been sent out of the State; and there is serious talk of organizing a Vigilance Committee composed of the men of property and respectability, to take the ring-leaders of the factions in hand. In this city, the movement gains but few adherents, and these almost entirely low French and Italians. Everywhere the talk of the socialists is intensely rabid, and their avowed object to accomplish their revolutionary ends by lawless violence.

The Fenian agitation against Canada seems to be more a matter of talk than action; nevertheless the Canadians have been vigorously preparing to give any hot-headed filibusters a warm reception. Forts along the border have been armed, gunboats on the lakes and the St. Lawrence equipped, the militia abundantly furnished with arms, ball cartridges and other military supplies, and it is far more than probable that any Fenian bands that may venture across the frontier will be treated even more roughly than those under O'Neil a few years ago. In San Francisco harbor a party of Irish excursionists hoisted the Irish flag on their boat while passing a Russian war vessel; the latter dipped her colors in salute, fired a salvo of 21 guns, and many a Hibernian throat was taken home that night sore with cheering.

In addition to the 600 Russian officers and sailors on board the Cimbra, still on the Maine coast two other transports are on their way hither with a large number of men to form crews for steamers purchased in this country, in the event of war with England. Most, if not all of them will see service in the Pacific, and arrangements have been already made with the railroads for transportation across the Continent. It is said a fast new steamer has been already purchased in Philadelphia, another in San Francisco, and several in this city. However the sympathies of the people of this country may incline, the government is certain to follow the honorable example of all former administrations, and in case of war between nations with which we are at peace, cause a strict neutrality to be observed even by the most ardent adherent of the cause, and the most greedy speculator in the needs, of either belligerent. Professor Henry, Secretary of the Smithsonian Institution, Washington, and co-laborer with Maury, Agassiz and, other eminent scientists, died on the 15th. Lydia Sherman, the American Borgia, left the Connecticut State Prison, on the 15th to join the three husbands and four children whom she had poisoned—gone but not forgotton. Gen. Dakin, the celebrated rifleman, is dead—his skill with the rifle would probably have sent him to Congress had he lived longer, just as the same qualification has placed another of the successful team on the judge's bench in one of the courts of this city. Sitting Bull's forces are still encamped near Cypress Hills, Manitoba and are so well supplied with spoils from the plunder of Black Hills trains by some of his marauding bands, that lately a trader who visited the wily chief, could buy goods advantageously of him to be afterwards sold in Manitoba.

Every day for the last couple of months and more, the chief city papers have a couple of columns of telegraphic news from Europe relating to the Anglo-Russian-Austrio-Hungarian-Turkish complications. In these not only are the items of yesterday's news contradicted to-day, but the intelligence flashed as certain from St. Petersburgh, is often in the same column and issue, modified in Vienna, doubted in Berlin, scouted in London and directly the reverse stated from Constantinople, while other European capitals have each a different version of the matter. Sometimes a smart writer inserts an article in a certain paper for the express purpose of contradicting it in another, and showing how idiotically absurd it is in a third, and without much sketch of fancy, one might easily imagine such an erratic genius manipulating the news at the other end of the Atlantic cable. But, after all, the newspapers must say something to keep alive the public interest, and the telegraph companies must send so many words to earn so much money—behold the real cause of so many unreliable rumors.

So far as the issue of war or place can be inferred from these multitudinous reports, the matter is still in great doubt, but within the last few days, the prospects for peace are somewhat brighter. Count Schouvaloff, the Russian Ambassador to England, has been summoned to St. Petersburgh to hold a conference with the Czar and Prince Gartschakoff. Several interviews have taken place, the nature of which is still a secret, though, of course, a few omniscient newspaper correspondents have put their own conjectures with regard to the matter into the shape of positive information received, by special favor, from the highest authority. If their guess turns out true, they crow; if false, it's only another contradiction added to former hundreds. The Count is known, however, to be in favor of Russia making concessions with regard to the treaty of San Stefano; he is a strong advocate of peace, and thoroughly posted as to the temper of the English people. He started last Saturday on his way back to London, and the result of his mission will soon be apparent. It is said he bore to the Czar information of the changes in the terms of the treaty of San Stefano, on which England would insist at the cost of a war; and it is not unlikely that he bears back with him Russia's answer.

Meanwhile Gen. Todelben has moved his forces nearer Constantinople, and sent a peremptory message to the Porte insisting on the immediate evacuation of Shumla, Varna and Batoum, and the surrender to him of Buykudere, a port north of Constantinople, on the straight connecting the Sea of Marmora with the Black Sea. It is also rumored that he demands to be allowed to occupy both sides of the Bosphorus. In the treaty no time was named when Turkey was to surrender the fortresses, and accordingly she refuses to evacuate them until the Russian armies have withdrawn from the neighborhood of Constantinople. Osman Pasha has strengthened the defensive lines about the Turkish capital, and as he has 80,000 men under his command, it is not at all impossible that in the event of a Muscovite attack, they might find there another Plevna. Todelben is about to receive heavy reinforcements; the Sepoy troops ordered by Great Britain from India, have arrived in the Mediterranean. More are about to follow, and should the Government venture on the step, 1,000,000 soldiers could be readily raised from that source alone—but after fighting white men in Europe, would there not be danger of trouble and perhaps successful rebellion on their return triumphant to the East? Austria is greatly troubled by turbulent refugees from Bonia and will probably soon occupy that State; Roumania is still discontented, and her forces are so placed that rather than yield to Russia, they will retreat into Austria. The Ottoman rebellion in Bulgaria is spreading, and nearly all the mountain region is in the hands of the insurgents—a dangerous element on the Muscovite lines of communication. All parties while talking about peace, are vigorously preparing for war. Already the war has cost Russia $500,000,000, and she is nearly bankrupt, whereas England can well afford to spin out this expensive armed condition almost indefinitely.

On Monday last an attempt to assassinate the

aged Emperor of Germany was made by a socialist named Hodel, a native of Leipsic. While the Emperor was driving out in Under der Linden, the principal street in Berlin, the fellow fired a couple of shots at him, but fortunately without hitting him. The would-be assassin was at once arrested. At first he claimed that he merely wished to commit suicide in such a public manner as to attract attention to the wretched condition of the working classes to which he belonged. But it was proved conclusively that he aimed at the Emperor, and then he owned up to the fact. Socialism is becoming a terror to the upper and middle classes throughout Germany. The great strike of mill operatives in England still continues. Nearly 75,000 men are thus kept idle, and four times that number of women and children starving.

Manufacturers of Ladies' Suits, that use the Davis Vertical Feed Sewing Machine, are doing the sewing in the most elegant manner, and entirely without basting, or showing the stitches, by the use of very simple attachments. The invention and introduction of the Vertical Feed is an invaluable addition to Sewing Mechanism. The old under-feed machines will be rapidly superseded by this new and more perfect device for sewing, as it is adapted to every variety of work. The Davis Sewing Machine Company are building an addition to their large manufactory at Watertown, New York.

We call the attention of farmers and threshermen to the advertisement of the Fearless Horse-Power and Thresher and Cleaner, elsewhere in this number of our paper. This machine is the only one that received an Award on both Horse-Power and Thresher and Cleaner at the Centennial Exhibition, Philadelphia, and ranks among the best of its class. An Ex-President of the New York State Agricultural Society said of HARDER'S Machines, "they are the best ever made," and the same testimony has been borne by equally good authority time and again. For further information send to MINARD HARDER, Cobleskill, N. Y.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 18, 1878.

BEANS AND PEAS.—Strictly choice Mediums are the only ones of that grade selling, and prices are stronger with small sales. Marrow beans for Havana use are unsettled, owing to a late advance in freight; the cost is now 90c. per bbl; formerly 30c. This will prevent shippers from operating until the W. I. market becomes adjusted. Exports this week are large, as they contain about 1,000 bbls. for Brazil; a new outlet for wholesale parcels. Pea Beans firm for prime. White Kidney steady. Red are scarce, having been largely included in the late sales for Pernambuco. Black beans quiet. Receipts of beans for week, 7,492 bush. Canadian peas are easier for ordinary quality, bulk and bond, quoted 83c. Green Peas doing better, $1.05@1.10; Southern B. E. Peas nominal, at $2.85@3.00. Exports of peas, 17,400 bush. We quote medium beans, choice, $1.65@1.67½; fair to good, $1.55@1.60; marrow, prime, free to vessel, $1.70@1.75; fair to good, $1.50@1.60; Red beans, $1.40@1.55; white kidney, $1.60@1.70; red do., $2.25@2.50; black beans, $2.40.

BUTTER.—Moderate prices have ruled since our last, but the market has shown a steady animation that might have helped rates, were not supplies so liberal. Western butter forms a large share of the receipts, but with rich, yellow State at the present ranges, Western has not its old time dominion over close buyers. Exporters include some creamery in their purchases. Firkins are wanted for coastwise use, but have to be packed here. Welsh tubs also have been repacked to some extent. State farmers' butter flown; great care, however, should be used as the proceeding at this early period is more or less experimental. Milled Western factory is slow of sale, and even fine ladle-packed must have extra merit to reach the price-limit.

Receipts for the week 24,812 pkgs,; exports do. We quote:

State creamery, choice 21@22c., a few at 23c.; fair to good 18@20c.; Half tubs and pails selected, 19@20c.; fair to good, 17@18c.; Welsh tubs, choice, 18@19c; other useful, 15@16c.; poor or stale State 12@13c.; Western, creamery choice, 21c.; other, 17@19c.; Western dairy fine 16 18c.; other, 12@13c.; factory (ladled) 13@14c. do. (milled) 11@12c.; poor Western 7@10c.; do. and grease, 4@8c.

Exports, past week, 4,300 pkgs.

BEESWAX.—At reduced prices a small trade comes from exporters. Sales at 27@27½c for Southern, and Western at 26½c.

Exports past week 4,475 lbs. Extra N. C. Wax held above 27c.

BROOM CORN.—Is very slow but not changed in price. Quotations are 6@7½c for hurl and short brush; 5@6½c, for medium green, 4@5c. for red and red-tipped, ₱ lb.

COTTON has shown a freer export demand, and closed firm, Latest prices are 11.13c@11.14c. for May; 11.22c. for June; 11.32c. for July; 11.35@11.36c. for August; 10.96@10.97c. for September; 10.75@10.77c. for October; 10.66@10.67c. for November; 10.66@10.67c. for December; 10.75@10.77c. for January; 10.85@10.86c. for February; 10.93@10.95c. for March, and 11.09 for April.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Fair	12 11-16	12 11-16	12 13-16	12 13-16

Stained.

Good ordinary, 8 5-16; Strict ordinary, 9 1-16c; Low middling, 9¾c.; Middling, 10⅛c.

CHEESE.—Early in the week shippers were very indifferent, and but very little business was accomplished notwithstanding a willingness to accept concessions. Prices finally settled sharply and export trade was invigorated. At the close the supplies for the week proved lighter than had been expected and a steadier market was the result. Quotations are:

For factories, 10@10¾c. for best lots, the latter for special lots; 8 @8¾c. for good and prime; 5@7c. for half skimmed, and 3@5c. for skimmed. State, farm dairy at 9@10c. for good to choice, 7@8c. for fair to good and 5@6c. for poor skimmed. Western at 10c. for fine; 8½@9½c. for good to prime; 9½@9¾c. for western flat; 8@9c. for good to prime; half skimmed, 6@6c.; skimmed, 3@4c.

Cold weather has taken off a good deal of "show" from even some of the best factories, and part of the undecided feeling of the early part of the week may be ascribed to that fact.

Exports for the week, 46,798 packages.

Receipts, 58,425 boxes.

Gold closes 100¾.

Liverpool quotation, 61@62s. new cheese.

DRIED FRUITS.—Some slight changes in prices of small fruits, and the general market is very dull.

Peaches—Fancy North Carolina 12@13c.; Choice Georgia 10@11c.; good to prime Georgia; 8@10c.; un. peeled halves, 6½c.; quarters, 4c. Pitted cherries choice new, 21@22c.; Raspberries, 25@27c. New York State plums, 12½@13; Southern plums, 11@12c. Blackberries, 10@10½c. Apples—State quarters, 4½@5½c.; do sliced, prime, 6@6½c.; good, 5c.; Western quarters, 4@4¼c.; Southern at 6@7c. for prime sliced, 5@5¼c. for fair to good; Southern quarters, 4½@4¾c.; Tennessee quarters, in bags, at 2½@3½c.; prime and fancy North Carolina sliced at 8@12c.

Exports for the week, 697 bbls. dried apples.

EGGS.—Receipts for the week, 12,045 bbls.; do last week, 12,042 do. Supplies are very liberal and the demand has not kept pace with them. Western or Canadian stock is not running regularly fine, and buyers insist upon the count being made good. Duck eggs sell in with hens. Goose eggs dull at 24@25c.

Near points, 14@15c.; State and Penn., 13c.; Western and Canadian, fresh, 12@12¼c.; fair Southern, 11@11½c.; inferior or stored eggs, 11c.

FLOUR.—Has yielded in price 10@20c. per bbl. and closed weak and rather dull on the tame advices from the other side.

Latest prices are $4.10@4.60 for very poor to strictly choice superfine State (fancy lots a shade higher); $4.65@5.00 for very poor to good extra do. odd lots and lines; $5.00@5.40 for good to fancy do.; $4.10@4.60 for very poor to choice superfine, Indiana, Iowa, Michigan, Ohio, &c., (fancy lots at higher figures); $4.60@5.00 for inferior to good shipping extra do., and $5@5.40 for good to fancy extra do.; common to choice white wheat extras, $5.15@6.25; choice to fancy do at $6.25@7.25; red and amber winter wheat, inferior to choice trade and family, at $4.55@6.25; round hoop Ohio at $4.75@5.10 and trade and family brands of do. at $5.15@6.25, the latter rate for choice; (fancy lots quoted higher); St. Louis, $4.30@5.75 for very poor to good extra, and $5.75@6.50 for good to very choice, with a few brands of fancy quality quoted up to $7.00@7.25); Minnesota clear, very inferior to very choice at $4.60@5.00; Minnesota "straight," inferior to very fancy, at $5.60@6.75, and patent poor to fancy choice at $5.75@8.50, unsound stock at from $2.25@5.75; city mill extra at $5.80@6.00 for fair to very choice for West Indies; do. for England at $4.85; do. trade and family extras, $6.25@7.25; do. for South America, $5.00@7.00 for fair to fancy; No. 2 at $2.85@4.00 for inferior to very fancy.

CORN MEAL.—Sales at $3.00 for Brandywine and $2.25@2.65 for Western yellow.

FEED.—Sales of 40 lbs. at $15@15.; 60 lbs. at $15.@16; 80 lbs., at $15@16; 100 lbs. at $17@19. Rye feed, $17@18, and Sharps at $18@20.

FRESH FRUITS.—Russets are now the only commercial lots of apples. Extras bring $6, others, $3.50@5. Strawberries have been abundant but of poor quality, being green, rain soaked or sandy. Dealers have had to repack a great many and in that way have obtained the ex rame price. Some good Boydens begin to arrive. N. J. crates, 15@18c.; Maryland Delaware and North Carolina, in order, 12@15c.; poor, 8@10. Gooseberries per bush. $1.50@2; cherries Southern 5@7c. A severe frost occurred here last Monday night reports from near by vineyards show that grapes have suffered; some State strawberry patches also injured. Peanuts are unaccountably quiet; Va. handpicked, $1.35@1.40; prime to extra $1.20@1.30; common to fair 85c.@$1.10. Pecans 6@8c. Receipts of peanuts, 1,473 bags.

GRAIN.—All articles are lower and closed weak, with a pressure to sell, as the situation on the other side is looked upon as peaceful.

Latest sales of wheat are of No. 3 spring at $1.13; ungraded spring at $1.16@1.18½; No. 2 Northwest, May, at $1.23; do., June, at $1.21; New York No. 2 spring, spot, at $1.20½@1.21; do, May, at $1.20; do., June, at $1.18½@1.19¼; do., July, at $1.17½; No. 2 Milwaukee at $1.23¼; No. 2 Chicago spring at $1.21; No. 1 Milwaukee, deliverable first ten days in June, at $1.16; No. 1 spring, lots, on spot, at $1.26@1.27; No. 1 white at $1.37@1.38; No. 1 amber, long, at $1.36½; No. 1 red, choice, to a miller, at $1.36; No 2 red at $1.30; do., May, at $1.20; do., June, at $1.28¼; Canada spring in bond at $1.17. Rye at 71@72½c. for Western, and Canada in bond at 71½@75. Corn at for No. 2 for May delivery at 50¼@50¾c.; No. 2 for June at 50¼@50¾c.; No. 2 for July at 51¼@51½c.; steamer mixed for May at 49½c.; do. for June at 49c. The New York steamer mixed at 50c.; New York No. 2 at 50¼@51c.; New York No. 3 at 48¼@49c.; ungraded mixed 48¼@51c.; Kansas mixed, 50¼@51c.; Southern white from store at 50½c. and southern yellow at 50c; Oats at for New York No. 1 white at 38@38½c; New York No. 2 white at 34¼@34¾c.; do. for May delivery at 34½c.; New York No. 1 at 34c.; New York No. 2 at 33½c.; New York No. 2 at 33c.; No. 2 Chicago at 34@34½c.; do. for June delivery at 31c.; mixed Western, 33@34½.; white Western at 34½@38½c.; mixed State at 31@31½c.; white State, 34½@38c.

HAY AND STRAW.—Prime lots of hay are in sufficient demand to keep them steady, but shipping and lower qualities are plenty and weak.

Bale hay, 55@60c. for shipping, and 70@80c. for retail qualities; clover, 50@60c. for prime. Straw, 40@50c. for long rye; 35@40c. for short rye, and 40@45c. for oat.

Exports, past week, 1,350 bales. Since Jan. 1st 26,300 do.; same time last year, 23,375 do.

HOPS.—Exports for the week, 400 bales. Trade generally is very slow and prices easy. Reports of the growing vines are favorable with few exceptions.

New Yorks, good to prime, 7@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.

MISCELLANEOUS.—Feathers have improved; best Western live, 45@50c; mixed, 40@42c. Domestic essential oils quoted, currency prices: Peppermint, in tin, $1 75@2; in glass, $2 50. Wintergreen, large pkgs, $1 90@2; small, $2 10@2 15. Sassafras, 42@45c. Ginseng, $1 12@1 25. Seneca root, 55@60c. Honey is offering, but entirely unsalable. Maple sugar nominal at 10@12c; sirup in cans, 70c@$1.

OIL-CAKE—Quoted at $30.50 per ton.

POULTRY AND GAME.—Receipts of live have not been so free as was expected and prices are fairly firm. A large offering is expected next week. Spring chickens now quoted, ₱ lb, 25@27c. Fowls, choice, 12@13c.; Western, and Southern 11@12½c.; Roosters, 6@7c.; Turkeys, 8@12c.; Ducks, choice, $1.12; poor to fair, 50@85c., the lowest for Southern; N. J. Geese, $1.25@1.50; other, 70c.@$1.

Country-dressed poultry scarce but not wanted, especially scalded; city-dressed turns out brighter for market use. Turkeys, 12@15c.; Fowls, extra, 14@15c.; good to prime, 10@13c.; very common, 8@9c. Phila spring chicks, 31@36c; do winter, 25@27c.

Game is in moderate supply, and good, cool holding weather has stiffened prices. English snipe $2 50 ₱ doz; Plover, $1 50@1 75; Sand snipe, 45@50c.; wild pigeons, stall fed, $1 40@1 50; flight, 75@85c; squab, 50@60.

SUGAR.—Refined at 9¾ for cut loaf, and powdered, 9¾ for crushed, 8¾@9¾ for soft white and 7¾@8¼ for soft yellow.

TOBACCO.—A good export trade has been in progress and there is a firm range of prices.

PROVISIONS.—Hog products are generally lower and depressed.

Mess pork, $9 for spot lots June and July and $9.10 for August. Bacon at 4½c. for long clear and 5 1-16c. for short clear. Lard—Western steam, 6.95@6.97½c. for spot, lots, 7.93½c. for May and June and 6.97½c. for July. Stearine 7¼c. for Western. Tallow, 7 1-16c. for prime. Beef hams at $17@17.50. Beef—New extra mess, $12.@12.25; plain, $10@11.50; packet $13.50@14.50 bbls. family mess, $15@16; extra India mess $20@23 for city brands; do. Philadelphia, $19@20.

VEGETABLES.—Old Peach Blows and Rose are firmer, $1.37@1.62 good to extra; common grades of potatoes dull, at $1.00@1.12 all with bbl.; Southern new arrive steadily, and there is a good offering of Bermuda, Fla., $2.50@3.50; Char. and Sav., $2.50@4; Ber. $5@5.50; Southern, $1.50@2. Some L. I. and N. J. potatoes were damaged by the frost of last Monday. Asparagus is higher since the cold snap. Green Peas higher. Some former receipts worthless, mostly pods. Asparagus, Oyster Bay, $3.50@3 doz. good to best N. J. $1.50@2.50. Md. green peas bbl. $3@4.10; Norfolk $3.50@4. String beans, ref., crate $2@2.25; flat, $1.75@2. Cucumbers Sav. and Char. $2.50@3.; Fla. 75c.@$1.50. Rhubarb per 100, $1.50@1.75. Spinach, 37c.@50c. bbl. Lettuce, $1.25@1.50. Norfolk Cabbage, bbl. $1.50@1.75; Char. and Sav. $1.75@2 25. Fla. tomatoes crate $3@4; Ber do. 5 quart box 40c.@60c. Bermuda onions sell readily, as domestic are out; crates $1.75@1 87.; Ber. beets crate 50c.; Nor. do. 100 bunches $2.@2.50; do. turnips $1.@2.

WOOL.—Not much trade the past week, and very little prospect of an improvement in this respect until the new clips are ready for market. Prices are weak, but essentially as quoted last week.

Ohio, Pennsylvania and Virginia XXX and picklock, 43@46; XX, 38@41c; X, 38@40; No. 1, 39@41; No. 2, 34@37c.; common 32@34; combing, 40@45.

New York, Michigan, Indiana and Wisconsin. XX, 33 to 36c.; X, 33@36c.; No. 1, 30@32c.; No. 2, 31@35c; common 30@31.; combing 40@44.

Iowa, Vermont and Illinois X and XX, 33@35c.; No. 1, 34@37.; No. 2, 30@32.; combing, 38@43.

Missouri, Kentucky, and Tennessee—Washed fleece, 30@35c.; unwashed, 23@26c.; unwashed combing, 28@31c.

LIVE STOCK MARKETS.

NEW YORK, May 18, 1878.

BEEVES.—Receipts for the week, 11,802 head: do., last week, 8,994 do. Regardless of enlarged receipts the market is higher and strong. Nearly one-half of yesterday's 46 cars were taken for export. Light Texans sold at 9¾c. Most of the trade at 9¾@11c.; a few extra steers 11¼@11½c. Exporters paid as high as 11c.

COWS AND CALVES.—Market unchanged. Choice as valuable in the country and here.

VEAL CALVES.—Receipts for the week 4,827 head; do last week, 4,602 do. good to prime live calves 5¾@6¾c., the latter for N. J. Buttermilk extra 4@4¼c.

SHEEP AND LAMBS.—Receipts for the week, 27,466 head; do last week, 22,235 do. The market was dull and at the close prices favored buyers. Poor to good clipped sheep, 4¼@5¾c.; extra held, 5¾c. Southern and Western lambs, 7¼@8c.; New Jersey and State 9@10c.

SWINE.—Receipts for the week, 28,937 head; do. last week 27,686 do. Good light corn-fed Ohio worth $370@380 per 100

Reading for the Young.

AN ANGRY BABY.

No human being who saw that sight
But felt a shudder of pale affright.
He sat in a window three stories high—
A little baby, with no one nigh.

A stranger saw him, and stopped to stare;
A crowd soon gathered to watch him there;
A gleam! a flutter!—in airy flight
Came past the window, a butterfly bright!

From fields of clover and perfumed air,
Wayfaring insect, what brought you there?
The baby saw it, and eagerly
Reached out to catch it with glowing glee—

With fat, pink fingers reached out—and fell!
The awful horror no tongue can tell!
Poor little baby, so sweet and bright!
Pale faces quivered, and lips grew white;

Weak women fainted; strong men grew weak;
Up rose one woman's heart-piercing shriek.
Hurrah for the awning! Upon the fly
It caught the youngster and tossed him high.

The bounce prodigious made baby scowl;
He caught his breath, sir, and sent up a howl.
All blessed the awning that had no flaw—
But a madder baby you never saw!

"POCKET MONEY FOR THE YOUNG PEOPLE."—No. 3.

M. B. PRINCE.

ONE of the prominent, if not the most prominent, causes of the desire to leave the farm so prevalent among farmers' sons is, no doubt, a lack of pecuniary remuneration for services rendered. Though this may be an old idea advanced by some one of the few who have attempted to give us light on the subject, we do not now remember to have seen any explanation as to the *how to do it;* that is, how to give the boy an opportunity, how he may improve it both mentally and pecuniarily; all of which I propose to show, in a practical way, I hope.

But first a word to parents. Do not work the boys too hard, making men of them before their time—a practice that will surely destroy all the beneficial influences of rural life, and bring about the same results finally that is seen in the hot-bed growth of our cities.

As the boy labors by your side in the field, the orchard or garden, explain to him as far as you are able, the mysteries of plant growth; the principles of deep or shallow tillage, drainage, the effect of weeds in the hill of corn; the results of good or bad management in the care of domestic animals, as well as the different points of excellence in the various breeds, and their adaptation to different purposes. Assist him in procuring tools with which to while away a leisure hour, or allot to him a patch of land whereon to grow some crop for his own; to be disposed of as he pleases, advising him, of course, as to a proper investment of the proceeds. The ways are so many by which the young people can secure pocket-money, and the circumstances of location so different that to go through the whole category would be an endless task. Near small towns and in thickly populated rural districts, the growing of vegetables, plants and perhaps flowers will be found to afford a profit as well as a prolific source of pleasure and education.

Commence in a small way, enlarging as the business demands it. Secure good seeds of the best varieties, not too many, say two kinds of tomatoes, three of cabbage, etc.; when the proper season arrives, make an ordinary hot-bed, instructions for which you will find in many of the catalogues of seedsmen that are sent free by most of the RURAL'S advertisers.

One sash, 3x6 feet, is large enough for the first; when your tomato, pepper and egg-plants are about two inches high, have another bed ready, in which transplant two or three inches apart, then as the weather becomes more mild, a cold-frame or bed may be used to advantage for a second transplanting, where more sun and air should be allowed, which will "harden off" the plants, as the gardeners say, rendering them more able to withstand the after open-ground culture.

A cheap cover for the two later beds can be made of cambric, stretched on a frame; it does admirably for mild weather. Cabbages, cauliflowers, celery, etc., are usually sown where they are to remain until planted in the open ground. In this, as well as in other plans which we may propose, make it a point to produce the best. Establish a reputation in your neighborhood; above all, study the wants of your plants; observe the effect of much or little water, different fertilizers, etc., thus storing the mind with useful knowledge,

EDUCATION.

THIS is what Mr. Fowle says about cleanliness in a teacher: "Perhaps in no particular can a teacher be more useful to his pupils than by inculcating a habit of neatness, and in no one thing, perhaps, will the importance of our example be so distinctly felt. The superiority of female teachers in this respect is, perhaps one of the strongest reasons for the growing preference which is given to them. At every institute I saw young gentlemen who, in manner and personal appearance, were all that could be wished; but I saw also many who in these respects were far better fitted to be warnings than models for the imitation of youth. I do not wish the young teacher to expend all he earns in dress, but I do wish to see every teacher careful in regard to external influence. His clothes may always be neat and whole, however coarse. His boots may always be cleaned. His hair may always be neatly combed, his teeth perfectly white, his finger nails cut, his hat and clothes brushed, and his hands, nose, ears and neck perfectly clean. Frequent ablutions of his whole person, as well as of his face and hands, are indispensable. He must have a care as to his breath, that it be not offensive to those whom he is obliged to face so often. I do not hesitate to say that if I were on a school committee no man who used tobacco and who spit on the floor, should ever have my vote, if he applied for a school and would teach for nothing."

Large committees of our ablest teachers after full examination have reported that the complete introduction of the metric weights and measures, now making so rapid progress in this country, would save a full year of the school-life of every child.

In spite of all the efforts that are made in the cause of popular education, illiteracy is increasing faster than our population. The year saved would be enough to turn the scale. In a country depending for the safety of its free institutions upon the education of the people, these facts are of the most serious importance.

Such being the case, every friend of education, economy, and progress, must have a strong interest in the efforts now meeting with so much success, to secure these advantages for our country.

The Printing Times says we must accept the following data on the authority of the compiler, who has evidently more time than business on his hands: "A rapid penman can write thirty words in a minute. To do this, he must draw his pen through the space of a rod, 16½ feet. In forty minutes his pen travels a furlong. We make on an average sixteen curves or turns of the pen in writing each word. Writing thirty words a minute, we must make 480 to each minute; in an hour, 28,000; in a day of only five hours, 144,000; and in a year of 300 days, 43,000,000. The man who made 1,000,000 strokes with his pen in a month, was not at all remarkable. Many men, newspaper writers, for instance, make 4,000,000. Here we have, in the aggregate, a mark of 300 miles long to be traced on paper by such a writer in a year. In making each letter of the ordinary alphabet we must make from three to seven turns of the pen, or an average of three and a half to four." Perhaps some equally ingenious person will next inform us how much ink a journalist can save by not dotting his "i's."

Many Iowa towns have elected women to the office of school director under the new State law allowing women to hold office. The experiment is reported to be a successful one.

Princeton will send a party to Denver, to witness the solar eclipse of July 28th. It will be occupied principally with spectroscopic work.

I will never purchase lottery tickets so long as I can hire a man to rob me at reasonable wages. —*Josh Billings.*

A CULTIATED EAR.—An ear of corn.

LETTERS FROM BOYS AND GIRLS.

Our Foreign Cousin Again.

DEAR UNCLE TRUE AND COUSINS:—With great pleasure I see that my last letter has found its way into the dear RURAL, and encouraged by your very kind remarks, I will try again to step before the cousins to-day.

In my letter I promised to write to you about rural life in Switzerland, and hoping that you will not find my letters too long and dry, I undertake to fulfill my promise by giving first, an introduction on the outlines of the history. In old times, the times of the Middle Ages, half of Europe was the exclusive property of the government, the church and the numberless counts and barons. They possessed and exercised a most despotic power over their subjects. The common people owned no land in their own name; they had to work it either on shares or to rent from the proprietors; but they had no chance to buy it or to free themselves from the rent.

The constant wars in which the smaller and greater sovereigns were involved, and for which their respective subjects had to pay dear enough with life and property, led to the entire ruin of the people. Only after the spirit of civilization commenced to reach the heart of the population the serfs shook off the yoke and taking possession of the property of their former oppressors, they became for the first time owners of real estate; but this freedom was bought with the lives of thousands of our ancestors who fought like heroes against the foes of liberty.

The old Swiss were the first that protested, and the deeds of William Tell and others are well known across the Atlantic to a good many of our cousins. After liberty carried the victory over slavery, a revolution took place in the socia life of the people; darkness, ignorance and religious persecutions had to make room for light, civilization and freedom of religion; new inventions and improvements were made from year to year in agriculture and other sciences, population and prosperity increased, and after America was discovered the old world had means enough to explore the new, to settle there, and to turn the vast wilderness into the most productive country on the globe.

But as population increased very large farms became smaller and smaller; every generation had to divide the farm in smaller lots in order to content their successors, until our land is now all divided into one-quarter to five acre lots; and it is not very seldom that a farmer owning 50 acres of land, has it, perhaps, in 50 different lots, situated four or five miles around the village he lives in; and working on such a farm is what I call "small farming."

As I am through now with the introduction, I fear that more of my bad writing, (which, by the way is caused by bad pen and hard labor for the past days), would annoy UNCLE TRUE. If it should please you I shall write in my next letter something about small farming. *Au revoir donc!*

Clinton Co., N. Y. JOHN SCHWYN.

Our Pert Cousin.

So Wildfire actually considered me talented? Really I didn't expect to receive such a compliment from him. We sigh for another poetical effusion. Wildfire, why didst thou cease thy efforts? Renew them, we beseech thee, and gladden our hearts.

Where is Solomon? I fear his residence was among the sugar maples, and he has been boiled down, and some one has gobbled him up. Oh, heart-rending thought!

Where is Young Naturalist? Echo answers, where! Has he disappeared from this mundane sphere, or has he succumbed to Dew-Drop's smiles and departed our circle to be forever at her side?

Do any of you know the whereabouts of Belle E. F.? I have not seen a letter from her for some time; hope she will write again soon, you know "the more the merrier."

Will some one please tell me how to skeletonize leaves? Yours, excruciatingly,

Norfolk Co., Va. Bertha, alias Gerfalcon.

The Puzzler.

HIDDEN STREAMS OF WATER.

1. DRIVE rather fast.
2. There's a flake of snow.
3. 'Tis Alla Baba, you know.
4. Let Ella go once.
5. Why, Bub, a yell is a scream.
6. Is this easy?
7. Doc., Eanice loves you.
8. I met Eric reeking with vile rum.
9. I live in Brooklyn, E. D.
10. Is Dover ill?
11. Will Rivu let egg-nog alone?
12. So, under the sod he sleeps.
13. Castra, it seems wrong.
14. Nic., Han., NeH and I.
15. I wonder if "Rith" is right?
16. In the march I (Pela) got out of step.
17. The Mogul fainted.
18. See the Hypoo laugh!
19. Upon Dave's word.
20. Can Allen go?
21. Lestu, a rye-field took fire.
22. He's a tar no more.
23. At last, Rea M. let me kiss her.
24. I am ill, Racero.
25. I live in Maine.

☞ Answer in two weeks. LITTLE ONE.

CROSS-WORD ENIGMA.

My first is in you but not in me,
My second is in neither, I think you'll agree;
My third is in cedar but not in pine,
My fourth is in liquor but not in wine;
My fifth is in stone but not in wall,
My sixth gets in trouble, I leave to you all;
My seventh is in riddle but not in sieve,
My eighth is in Utah, where "latter days" live;
My ninth comes in yearly, not monthly, I ween,
My whole I prize dearly, though never have seen.

☞ Answer in two weeks. MARY WALKY.

DOUBLE ACROSTIC.

1. A NATIVE of India and Hindostan. 2. Illegal. 3. A measure. 4. A complimentary title applied to married or elderly ladies. 5. Bustle. 6. In no degree. 7. Clean. 8. A girl's name. 9. A dance. 10. A peak of the Andes Mountains. 11. A lizard. 12. A place of toil and misery. Primals and finals form two of Sir Walter Scott's works.

☞ Answer in two weeks. A. O. L.

DIAMOND PUZZLE.

1. A CONSONANT. 2. A month. 3. A woman's name. 4. Weakness of resolution. 5. A modified disease. 6. New doctrines. 7. An earthen vessel. 8. Wickedness. 9. A consonant.

☞ Answer in two weeks. S. C.

TRIPLE ACROSTIC.

1. HAVING six sides. 2. A lady's name. 3. An ancient religion. 4. Exhumed. 5. A tyrant. 6. Part of a ship. 7. To dry in a kiln. Primals, centrals and finals form three fishes.

☞ Answer in two weeks. BALTO.

WORD-SQUARE ENIGMA.

1. A CITY of Russia. 2. One of the Caroline Islands. 3. The primitive form of a word. 4. A fable.

☞ Answer in two weeks. DR.

PYRAMID PUZZLE.

1. A CONSONANT. 2. A boy's nickname. 3. Foolish. 4. An idle prater. 5. A female writer. 6. Heedfully. Centrals form a county of Maryland.

☞ Answer in two weeks. FLORIDIAN.

PUZZLER ANSWERS.—May 11.

TRANSPOSITION.—

"Is it not sweet, beloved youth,
To rove through erudition's bowers,
And cull the golden fruits of truth,
And gather fancy's brilliant flowers?"

Sabbath Reading.

CHRIST AND THE LITTLE ONES.

MARK 10: 13. LUKE 18; 15.

"THE Master has come over Jordan,"
Said Hannah, the mother, one day;
"He is healing the people who throng Him
With a touch of His finger they say.

"And now I shall carry the children,
Little Rachel, and Samuel, and John;
I shall carry the baby Esther,
For the Lord to look upon.

The father looked at her kindly,
But he shook his head and smiled:
"Now who but a doting mother
Would think of a thing so wild?

"If the children were tortured by demons,
Or dying of fever, 'twere well;
Or had they a taint of the leper,
Like many in Israel."

"Nay, do not hinder me, Nathan,
I feel such a burden of care;
If I carry it to the Master,
Perhaps I shall leave it there.

"If He lay His hand on the children,
My heart will be lighter, I know;
For a blessing forever and ever
Will follow them as they go."

So over the hills of Judah,
Along the vine rows green,
With Esther asleep on her bosom,
And Rachel her brothers between,—

'Mong the people who hang on His teaching,
Or waiting His touch or His word,
Through the row of proud Pharisees listening,
She pressed to the feet of her Lord.

"Now, why should'st thou hinder the Master,"
Said Peter, "with children like these?
Seest not how from morning to evening
He teacheth and healeth disease?"

Then Christ said, "Forbid not the children!
Permit them to come unto Me!"
And He took in His arms little Esther,
And Rachel He sat on His knee.

And the heavy heart of the mother
Was lifted all earth care above,
As He laid His hands on the brothers,
And blest them with tenderest love,—

As He said of the babes in His bosom,
"Of such is the Kingdom of Heaven;"
And strength for all duty and trial
That hour to her spirit was given.

[*Julia Gill.*

SINAI.

IF the Wady Feiran, by its palm-grove and its brook, be marked out as the first long halting-place of Israel, the high valleys of Jebel Musa with their abundant springs no less mark out the second. The great thoroughfare of the desert, the longest and widest and most continuous of all the valleys, the Wady es-Sheykh, would lead the great bulk of the host, with the flocks and herds, by the more accessible though more circuitous route into the central upland; while the chiefs of the people would mount directly to the same point by the Nukb Hawy, and all would meet in the Wady er-Rahah, the "inclosed plain" in front of the magnificent cliffs of the Ras Sufsafeh . . . No one who has approached the Ras Sufsafeh through that noble plain, or who has looked down upon the plain from that majestic hight, will willingly part with the belief that these are the two essential features of the view of the Israelite camp. That such a plain should exist at all in front of such a cliff is so remarkable a coincidence with the sacred narrative as to furnish a strong internal argument, not merely of its identity with the scene, but of the scene itself having been described by an eye-witness. The awful and lengthened approach, as to some natural sanctuary, would have been the fittest preparation for the coming scene. The low line of alluvial mounds at the foot of the cliff exactly answers to the "bounds" which were to keep the people off from "touching the mount." The plain itself is not broken and uneven and narrowly shut in, like almost all others in the range, but presents a long retiring sweep, against which the people could "remove and stand afar off." The cliff, rising like a huge altar in front of the whole congregation, and visible against the sky in lonely grandeur from end to end of the whole plain, is the very image of the "mount that might be touched," and from which the "voice" of God might be heard far and wide over the stillness of the plain below, widened at that point to its utmost extent by the confluence of all the contiguous valleys.

REMEMBER that God is no curious or critical observer of the plain expressions that fall from his poor children when they are in their closet duties; 'tis not a flow of words, or studied notions, seraphical expressions, or elegant phrases in prayer, which take the ear, or delight the heart of God, or open the gate of glory, or bring down the best of blessings upon the soul; but uprightness, holiness, heavenliness, spirituality and brokenness of heart—these are the things that make a conquest upon God, and turn most to the soul's account.

THE Lord defines faith to be a coming to God in Christ; to be a resting, or staying, or rolling of the soul upon Christ. And it is always safest and sweetest to define as God defines, both vices and graces. This is the only way to settle the soul, and to secure it against all the wiles of men and devils, who labor by false definitions of grace to keep precious souls in a doubting, staggering and languishing condition; and to make their lives a burden and a misery unto them.

GOD hath bestowed himself as a portion upon as great sinners as any are that as yet have not God for their portion.

PERSONAL ITEMS.

The Russian painter Verestchaguine, who accompanied Gen. Skobeleff during the late war, is now in Paris, occupied in painting some of the most terrible incidents of the campaign in which he took part.

Sir Garnet Wolseley, the model English soldier, has taken to growing his hair long, after having been for some years trying to cultivate what is known as "a mixture of the beauty of a convict and cocoanut." The change becomes him, but he does not look half so fierce as he used to do.

Mrs. President Hayes explained at Philadelphia that while she does not use wine herself, nor is it used in her family, she has no objection to other people using it if they think proper to do so. In short, she enjoys herself in her own way and fully accords the same privilege to all other persons. Thanks Mrs. Hayes!

Thomas Carlyle, the mighty British thinker and uncouth writer, is as weary of hearing the Father of his Country spoken of as "first in war, first in peace, and first in the hearts of his countrymen" as the old Greeks were of hearing of "Aristides the Just." He thinks a biography ought to be written that would "take him down."

Senator Don Cameron has provided against any clashing of interests in his family by arranging that his eldest daughter shall have charge of her five brothers and sisters at Harrisburg, and his newly-wedded bride be given sole possession of the Senator's house in Washington. His wife and daughter are nearly of the same age and for years have been warm personal friends.

Mr. Frank H. Taylor, the "Graphic" artist and author of the poem "Her Letter," published in the issue of the RURAL for March 23d, is connected with the latest romance in real life. He was at the wreck of the Huron as a newspaper correspondent, and finding among the *debris* a woman's letter to a loved one, whose form might then be lying cold and stark somewhere along the beach, Mr. Taylor penned the lines describing the circumstance, and the verses were so widely copied as to lead to the identification of the fair writer. Fortunately the young man to whom the stray letter was addressed did not meet the fate of many of his companions, but was saved, and at Sandusky, O., a few weeks ago, was wedded to the author of the tender epistle. His name is R. Gracey Denig, of the U. S. Navy.

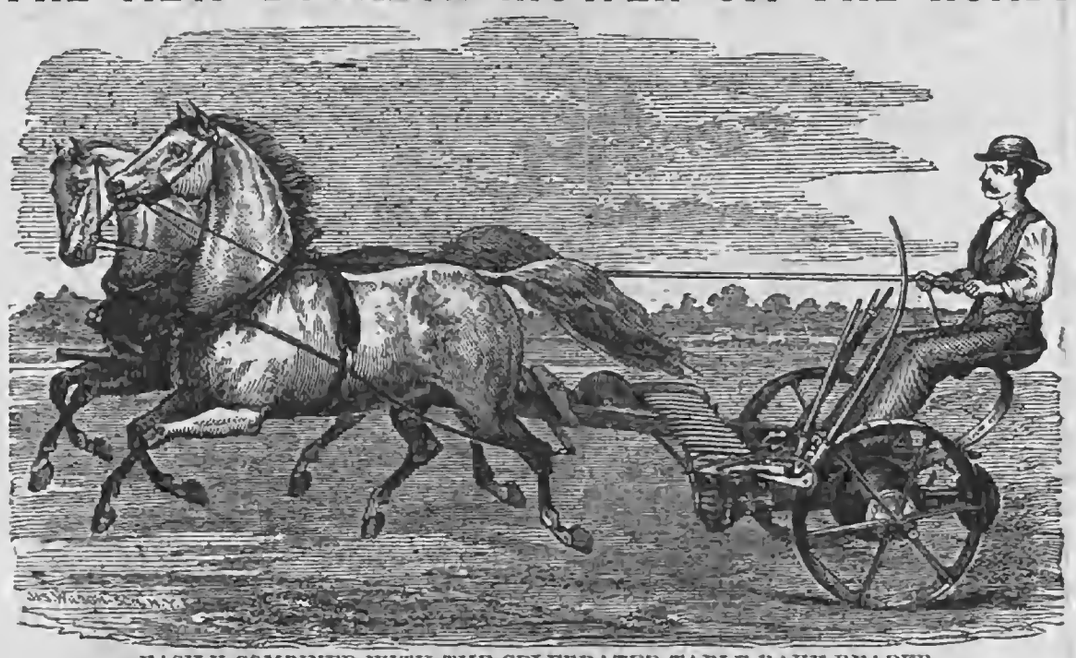
THE NEW BUCKEYE MOWER ON THE ROAD.



EASILY COMBINED WITH THE CELEBRATED TABLE RAKE REAPER.
All iron and steel but the tongue. Lightest running, most convenient and durable machine in the market. Absolute safety for the driver, and no weight or side draft on the horse's neck. Always in the lead and justly called the Invincible Machine of the Age. Manufactured by
C. AULTMAN & CO., Canton, Ohio, and
AULTMAN, MILLER & CO., Akron, Ohio.
We also build the Buckeye Harvester and Self-Binder. Send to either House for Descriptive Circular.

BRADLEY'S CHANGEABLE SPEED MOWER
Has more good points, less complication, more adaptability and less parts than any other Mower in the world.
BRADLEY'S AMERICAN HARVESTER, No. 2
The lightest, strongest and most durable single Reaper in the market.
For simplicity, durability and quality, these machines cannot be excelled. Every machine fully warranted to be as represented.
At the Great Mower and Reaper Trial, held at Watertown, N. Y., July 6-7-20th and Aug. 8th, these machines carried off the Highest Prizes, viz., Two Grand Silver Medals, over the Wood, Buckeye, Wood's Eagle, Meadow King, Warrior, Eureka, &c.
Circulars, descriptive of these machines, sent free by addressing BRADLEY & CO.,
Syracuse, N. Y., or Chicago, Ill.

CREAMERY BUTTER.
The Cooley System of Butter-Making has been before the public but one year, yet over 1,300 Dairies have introduced it. Read for yourself what people say about it who are using it:
OGDEN FARM, NEWPORT, R. I., March 24, 1878.
VERMONT FARM MACHINE CO:
Gentlemen:—We are more and more pleased with the Cooley Creamer as we continue to use it, and we feel confident that we shall produce a better quality of butter this summer by means of it than we ever had before. We are now getting $1 a pound for our butter. Very truly yours, MELVILLE BULL.
Send 3c. stamp for Circular to

WHEELER & MELICK CO.,
ALBANY, N. Y.
Send stamp for Circular and report of Centennia trial.

If you want to buy a Sulky Rake this season, do not buy an old-fashioned Hand-lever Rake; they have had their day and are behind the times. The self-operating rakes or "Horse Dumpers," as they are called, are now acknowledged to be a great improvement over the old method of compelling the man instead of the horse to do the hard work.
THE TIGER HAY RAKE
is admitted by all to be the Standard Self-operating Rake. It is no experiment but a PROVED SUCCESS, and has double the sale of any other Sulky Rake in the United States. Send for Circulars.
J. W. STODDARD & Co., Dayton, O.
Sole Manufacturers.

PENNOCK'S
Patent Road Machine
Keeps the road in far better condition, and at half the present cost. Circulars free.
SAMUEL PENNOCK, Ithaca, N. Y.

Wit and Humor.

SPARKS AND SPLINTERS.

A SHOEMAKER advertises medicinal boots. The virtue is in the heal.

MORTGAGES are like burglars, because they secure (seek your) money.

To reduce pounds to shillings—take plenty of brandy and water, with cigars and billiards.

"SIGGARS, towbacko and ballony sawsig," is the worst sign of the times and appears in an Augusta saloon.

THE following translation was made by a Frenchman who professed to teach languages, and who thought he was telling a story in really beautiful English: "A lady which was to dine chid to her servant that she not had used butter enough. This girl, for to excuse himselve, was bring a little eat on the hand, and told that she came to take him in the crime finishing to eat the two pounds from butter who remain. The lady took immediately the cat whom was put in the balances, it just weighed that two pound. 'This is all the very much well for the butter,' the lady then she said, 'but where is the cat?'"

Out of Tune.

WHEN the tones of a musical instrument become harsh and discordant, we say that it is "out of tune." The same may be said of that far more wonderful and complicated piece of mechanism, the human structure, when it becomes disordered. Not only actual disease, but those far more common causes, overwork, mental anxiety and fast living, may impair its vigor and activity. The best remedy for a partial collapse of the vital energies, from these as from other causes, is Hostetter's Stomach Bitters, which is at the same time an agreeable and mind-cheering cordial, and the best possible invigorant in all cases of debility. It is an incomparable stomachic and antibilious medicine, eradicates fever and ague, and prevents subsequent attacks. It remedies with certainty and thoroughness bowel and kidney complaints, dyspepsia, nervousness, rheumatic troubles, and many other bodily ailments. It also counteracts influences which predispose to disease.

Entomological.

THE ACTION OF UNITED FORCES.

In the Rural New Yorker for May 11, we figured some carrion beetles and flies at their useful work—removing dead bodies from the air.

To-day we present another figure, showing these and other insects at work upon a bird. In the figure the two beetles on the tail feathers and under the wing, are Necrophorus; the beetle on the base of the tail, and the two similar ones on the breast, are Silphas; while the one under the head, and the other in the left-hand corner, are Necrophilas—near relatives of the Necrophorus. Here we figure also some hornets, which, as we mentioned before, do not disdain to eat flesh, at any rate when it is fresh, though they seem to prefer to catch their own prey, namely insects, rather than to associate at a common table with their lowly, distant relations. The butterflies, though lovely to the sight, are not so dainty, are filthy indeed; while the caterpillars, which are sometimes regarded with disgust by shallow-pated sentimentalists, are more cleanly and devour only the leaves of the trees or lowlier plants.

The labors of all these insects, however, except the Necrophorus and the flies, would avail but little in removing the decaying mass from sight. Linnæus said that three flies would, through their progeny, devour the carcass of a horse as quickly as a lion would devour it, which, as lions do not eat stale meat, must be true; but we may believe it would be true under other circumstances. A carcass, which has grown ripe under a hot summer sun, often seems to be composed almost entirely of a mass of living maggots. The burying beetles are not so prolific, but by their habits they get the body out of sight as quickly and as effectually as do the flies. Attracted to the corpse by the sense of smell, they surround it and push their heads under it. They scratch away the dirt with their legs, so that a wall is raised around the carcass at the same time that a grave is dug, and the body sinks into the hollow by its own weight. From time to time one or another of the beetles comes to the surface and observes the progress of the work. If any part is less buried than the rest it is examined attentively by the beetle, who stands before it with head and antennæ stretched in thought, and then returns to work. Soon we see that the strength of all the beetles has been concentrated upon this part, and in an almost incredibly short time the corpse has disappeared beneath the ground; then the mound over it is leveled, and, finally, no trace of the burial remains. In very favorable ground the corpse is buried thirty centimetres deep. Sometimes, when the ground upon which the carcass lies is not easy to dig in, the beetles push the carcass along to a place suitable for burial.

Gleditsch often and long watched these beetles at work, and says, that in fifty days four of them buried two moles, four frogs, three small birds, two locusts, the entrails of a fish, and two pieces of neat's liver. This flesh is buried as a receptacle for the eggs of the beetles, the beetles themselves feeding upon the larger and unburied carcasses.

[It was not our intention to have given this week the accompanying entomological cut, which, owing to a disappointment in procuring a first-page sketch, illustrative of the opening of the Paris Exhibition, (which we shall present next week), we were obliged to use.—Eds.]

ACTION OF UNITED FORCES.

GETTING RID OF THE CUT-WORM.

The following method of getting rid of the Cut-worm is just about as sensible as many methods of destroying insects which are published in these enlightened days. It is taken from Jossyln's account of his voyage to New England, printed in London in 1674:—"There is also (in New England) a dark dunnish worm or bug of the bigness of an oaten-straw and an inch long, that in the spring lye (*sic*) at the root of corn and garden plants all day and in the night creeps out and devours them. These in some years destroy abundance of Indian corn and garden plants and they have but one way to be rid of them, which the English have learned of the Indians. And because it is somewhat strange, I shall tell you how it is. They go out into the field or garden with a birchen dish, and spudling the earth about the roots, for they lye not deep, they gather their dish full which may contain a quart or three pints, then they carrie the dish to the sea-side when it is ebbing water and set it a-swimming, the water carrieth the dish into the sea-side and within a day or two you go in your field, you may look your eyes out sooner than find any of them."

Arboricultural.

AZALEA AMŒNA.

Among the various plants that have grown into public estimation of late years, few are more deserving than this little shrub. Faring like many new and old plants, we find it for years consigned to the greenhouse and the companionship of the larger, if not more showy, Chinese Azaleas, where its charms seem quite dwarf and dulled by contrast. Even after accident taught many that it possessed a considerable degree of hardiness, it was classed with such kinds as A. Obtusa and Sinesis alba, which, in ordinary exposures, have been found by no means hardy Very many new and choice plants experience a like fate. If any extraordinary beauty or delicacy of color and form appears, immediately the prize is too precious to expose to the rude blasts of winter even for the sake of experiment and the enlightenment of mankind. Let some one else, they say, benefit the world by the sacrifice of so beautiful a plant, we will preserve its attractions in the greenhouse. Fortunately, however, some one is generally sure to risk the sacrifice by carelessness, and to the surprise of every one the plant proves hardy. Again the accident occurs with the same result. A few daring spirits now slowly and tentatively leave out in winter more and more of these plants, until in time their absolute hardiness is established.

It would be a surprising figure could we learn the period of time required to demonstrate the hardiness of many of our now commonest flowering shrubs. Few have been doubted in this respect longer and more persistently in the face of facts than Azaloa amœna. In reality it is nearly, if not quite, as hardy as Ghent Azaleas and Rhododendrons; and a perfectly charming little object it is in early spring. Freed from the dulling effect, in the house, of masses of larger and highly colored Chinese Azaleas, the somewhat purplish shades of its petals disappear almost entirely in the open air and amid the quieter tones of green foliage, only enough remaining to intensify its deep and glowing red or rose color. The general tints of early spring are fresh and striking, but none are more so than the rich masses of flowers which completely envelop the dwarf, bushy form of Azalea amœna. Along a border, or among other shrubbery the effect at a little distance is almost dazzling. The flowers come, as usual with such plants, before the young growth, which shoots directly upward, and gradually fills in form below, year after year, until it assumes in time a solid mass of glossy, dark-green foliage made up of little oval leaves, often arranged in layer-like masses, after the manner of other hardy Azaleas. It is, however, much more compact than any thing of the Azalea genus, and quite evergreen, except that it takes on a bronze-brown hue in winter. The roots are very fibrous and numerous, which enables it to endure transplanting with great ease and safety.

Its proper location on the lawn is in some border or near the house on the outskirts of groups of Azaleas, Rhododendrons, etc. As with all similar plants, the selection of a sheltered side of the house, east or south, favors the length and retention of its bloom in spring, and its absolute safety in winter. For similar reasons, some remote and quiet nook of the lawn affords a fitting situation where its beauty can appear suddenly and unexpectedly to the observer. The pruning knife need scarcely ever be used on its regular, compact growth, or the soil specially prepared, if already properly enriched. All summer, its glossy foliage is attractive, so we cannot complain—as we do sometimes rather unjustly, of the Hardy or Ghent Azaleas—that its wonderful flowers constitute its chief, if not its only, charm. These words of praise for this little plant seem very weak, as we look on its glowing colors. S. Parsons.

Industrial Topics.

THE PARIS EXHIBITION.

PLAN OF THE BUILDINGS.

PARIS, May 12th, 1878.

THE Atlantic cables have robbed the European correspondent of a good deal of the interest and still more of the importance that used to be attached to his communications in the days when they had the freshness and piquancy of absolute news. Now the most exciting and significant items of intelligence are flashed with lightning speed across the waters, and the best the correspondent's laggard letter can do is to give details of information which, in the rapid current of modern affairs, has already become always at least a trifle stale and generally at best somewhat insipid. Moreover, it is his rather discouraging lot that the scenes and incidents an account of which would afford the most attractive subjects to his descriptive pen, are precisely those which the cablegram has already detailed with an exasperating minuteness that leaves little that is fresh for him to relate.

It would be pleasant to be the first to set forth to RURAL readers the magnificent pageantry connected with the opening of this the third International Exhibition held in the brilliant capital of France; to describe the impressive spectacle presented by the entire garrison of Paris, eighty thousand strong, drawn up along the route traversed by the Marshal President on his way to the ceremony, or forming his imposing escort; to particularize and describe the notable personages, headed by the comely Prince of Wales and the stalwart Crown Prince of Denmark, that rode beside him; to set to words the musical crash with which the arrival of the august party was greeted by the twenty-six military bands of Paris which were stationed near the Exhibition; to depict, or try to, the splendid scene in the gorgeous rotunda of the Trocadero, where princes, nobles, senators, representatives, the grand officials of the State and its worthiest citizens, together with the representatives of all civilized nations and of all enterprising journals assembled to the number of seven thousand to see the soldier ruler of the most warlike race in Christendom throwing open the finest display of the arts of peace which the world has ever seen, at a time when surrounding Europe is trembling beneath the tread of marshaling armies and the air is thick with rumors of approaching conflict.

But this is a theme on which the telegram has long since anticipated in detail the efforts of the correspondent, and in casting around for an appropriate topic for this first letter, none seems more timely than a brief account of the general plan of the Exhibition, which will be all the more intelligible to readers of the RURAL on account of the illustrations of the buildings that enriched its pages before the writer had crossed the Atlantic.

No exhibition was ever designed on a grander scale, and none has ever more completely realized the conceptions of the artist who planned it. Only two years and one month before the opening of the institution, the Champs de Mars and the hights of the Trocadero were bleak and desolate-looking; now towering masses of architecture, innumerable works of art, painting, sculpture, decoration, fountains, flowers, and vast stores of industrial treasures all contribute to render these spots the most interesting and beautiful in the finest city on the globe.

The distinctive feature of the present exhibition is the marvelous palace on the Trocadero enthroned, in stone, on an eminence facing the Champs de Mars, overlooking Paris and commanding enchanting views of long reaches along the valley of the Seine. Its vast dome and glittering minarets, towering above all neighboring structures, make it conspicuous miles away; and it is satisfactory to know the Municipality of Paris has decided to buy it as a museum and art treasury after the close of the the Exhibition.

Its rotunda, which accommodates 7,000 persons, was the scene of the inaugural ceremony on the first of May, and here also the prizes will be distributed at the close of the Exhibition on the 31st of next October. One on each side of the huge dome, two towers rise aloft to the hight of 250 feet, and from the elevated position of their foundation, their summits are the highest points in Paris. Flanking the rear of the rotunda, and spreading in two elegant semi-circles to the right and left, are the wings, fully double the length of the facade of our Capitol at Washington. These are occupied by exhibits of glass, porcelain wares, statuary and fine arts generally. Terraces with colonnades front these wings and overlook the beautiful garden which slopes down to the quay by the river, and which is adorned with a fine cascade of thirty feet fall, and eight large fountains surrounded by many smaller ones, the lowest and broadest of all throwing up a jet to the hight of eighty-three feet. Here and there in the garden, from the midst of trim lawns and brilliant flower-beds, rise houses illustrative of Oriental architecture. There too are conservatories and hot-houses gay and odoriferous with all species of flowers that delight the eye or perfume the air in every part of the world, to say nothing here of a host of other charming novelties the mere mention of which would crowd this page.

Quitting this delightful art department and crossing the Seine by that memorial of Prussia's crushing defeat by the first NAPOLEON—the Bridge of Jena, which has lately been broadened and strengthened—beyond the lines of the street cars, rises, on the Champs de Mars, the vast façade of the Industrial Exhibition, 2,315 feet in length and 1,145 feet in breadth. Surrounding this also is a wide garden stocked with flowerbeds, hot-houses and ornamental lakes. To the right are models of handsome cottages, to the left models of foundries and manufactures, whose designer evidently believes that utility and beauty are by no means inseparable; while the lawns are skirted with innumerable kiosques for the sale of newspapers, refreshments, guide books and the thousand and one other needs or conveniences of pleasure-seeking excursionists.

Passing into the Exhibition through the main or central entrance, a magnificent scene is presented by the Street of Foreign Nations, a thoroughfare eight hundred yards long, bordered by houses of every order of ancient and modern architecture; while at intervals tower aloft gigantic statues symbolical of the various nations near whose exhibits they stand. The Prince of Wales' gorgeous Indian pavilion comes first, then a shapely model factory; then a row of pleasure villas. Next comes the modest and by no means handsome structure representing American architecture, and beyond that Sweden, Norway, and Italy are represented in brick, wood and marble. Then Japan, China, Spain, Austria-Hungary, and Russia are followed by Switzerland with novel cottages and dairies, and Belguim with curiously fretted town-halls. Then Greece, Denmark, South America, Morocco Luxumburg, Monaco and Portugal stand in the order named. These houses stand to the right of the Grand Street, and the architectural sample of each nation forms the façade, the frontispiece, to its industrial and art exhibits which lie behind. The whole of the left side of the street and the left wing of the Exhibition building in the rear, are occupied by French houses and by the French exhibits, so that France alone has chartered as large a space as all the other nations combined.

The main building is chiefly of iron and glass and internally is laid out in rectangular, checquer-like blocks, a plan which while very convenient for visitors and economical of space, detracts a great deal from the impression of vastness which so large a building is calculated to convey. Throughout the whole area, every available foot of space seems occupied, while a good deal of the machinery has been forced into annexes, forming not the least interesting part of the grand display. Although in this first screed, it would be an ungrateful deed to notice the blemishes and shortcomings in a scene which has given me so much pleasure, yet it must not be supposed that either the management, the buildings or the nature and style of the exhibits are wholly without faults, but of these as well as of the chief attractions more shall be told the readers of the RURAL in my future letters.

THREBER.

Horticultural.

EXTRACTS FROM THE PROCEEDINGS OF THE WESTERN NEW YORK HORT. SOCIETY.

SELECTION AND PACKING OF APPLES.

THE essays and proceedings of the Western New York Hort. Society seem to us to be of unusual general interest. We have read the report through and made the following extracts which, though several of them have been printed before, are worthy of the consideration of a second reading:

President BARRY said he thought the prospects of the orchardist in Western New York were never more encouraging than at the present time, and he would advise the planting of the apple extensively, under proper conditions, with as much confidence as he ever did. The great markets of the world, with the millions of consumers, are just opening to us. We are near the great markets of our own country, and near the places of shipment abroad. It is conceded that our apples keep better and transport more safely than those of more Western growth, and we may always expect the readiest sale and best prices in foreign markets. One or two conditions, however, are indispensable. *Careful selection of the fruits and thorough packing.* These are necessary for our own markets, but far more so for the foreign market, as the loss arising from badly assorted and packed fruits is so much greater. Complaints are numerous from England on this subject, and the sooner our shippers understand and act upon this matter the better.

His conclusion is that there is no danger of apple culture being overdone in Western New York, always provided it be well done.

NEW VARIETIES.

Mr. J. J. THOMAS, one of the editors of the good Country Gentleman, alluding to the display of southern fruit, especially of apples at the meeting of the Am. Pom. Society at Baltimore last September, mentions among the best the following:

The Beauty of the World, from Morganton, North Carolina, was very handsome, good size, and of very good quality, and he was informed from the neighborhood of its origin, that it is there highly prized for its quality, productiveness, and late keeping.

Another fine one is Hare's Red Winter, a new seedling from Suffolk, Virginia, not yet disseminated, of excellent quality, and he learns from where it is well known, that it is highly esteemed for its quality, late keeping, and good bearing qualities.

ORNITHOLOGICAL.

Mr. HIRAM J. JONES, of Rochester, in an ornithological paper, says that among those birds which have fallen in the estimation of many fruit lovers, may be named the Robin, whose breast, bright and red, and whose song so joyful, are well known to all. It is indeed sad that he who cheers us first in spring should ere the leaves are yellow, be driven from our midst. Exasperated beyond measure at his audacity, forgetting the multitudes of measuring worms, rose-slugs, cabbage butterflies (in their larval condition), house-flies, table-flies and mosquitoes, which *constitute his diet early in the season*, we give him not a moment's rest, unless beyond the reach of the shot from our gun.

The Hawk or Owl carries off an occasional chicken, and pays for it by the loss of his life. But the good done in destroying field mice *alone* would pay for several dinners of chickens. Man must be short-sighted or he could not so soon forget the deeds of his best friends.

GRASS OR CULTURE FOR ORCHARDS.

In the report of the committee assigned to report upon the merits or demerits of certain systems of fruit culture in Wayne County, orchards used as pastures for hogs and sheep seem to do well. The animals fertilize the ground with their excrements, eat the fallen apples, worms and all, and are true generals in the Codling Moth war. In addition to this, the constant rooting of the hogs keeps the ground partially cultivated, and if they do not cultivate sufficiently, a handful of corn planted here and there, will set the animal plow-share in motion and cultivation ensues. The orchards which are properly cared for in this manner are almost universally known as very productive, usually annual bearers. And in the war which seems to wax warm between the advocates of clean culture and grass in orchards, may not this be a kind of neutral ground where the white flag of truce may be unfurled and good crops of fruit grown; for in this system we have some grass, some culture, and good, sound apples or pears.

The system of keeping orchards in grass from year to year with annual supplies of mulch, muck or fertilizers, and only plowed at remote periods of time if at all, has raised the most opposition among fruit growers and its advocates have been unsparingly denounced. It was the plain matter-of-fact statement of this mode of culture by a member which raised such a commotion in this Society two or three years ago, that he was not able to make a fair exhibit of his course of non-culture.

Orchards in Wayne Co. which have been cared for by this system are fully as productive, if not more so than by any other, if we except, perhaps, one, the land of which is seeded to grass, timothy, red top or orchard grass, (not clover, the roots are too long), and then where an annual mulch is applied, or manure, or manure and muck, muck alone, or composted with lime or with gas lime. The length of the new growth of the branches of the trees is the tongue, which the tree doctor examines, and applies the remedies at the right time, of the proper material and in proper quantities. It is a dangerous fact to publish that an orchard can be kept in grass for a long series of years and yet be profitably productive. But it is nevertheless true.

A number of orchards was visited in Cayuga County. All good managers find it necessary for the success of young orchards to cultivate the trees for several years after setting out. When planted in grass, the growth is feeble, and they are long in reaching bearing size. As they become older, the roots run deeper and they are less retarded by grass growing near the surface. A curious example occurred in this connection when trees of large growth, when set out, or two inches in diameter, grew more vigorously than smaller trees, or such as were only an inch in diameter when removed. Both were set in grass; but in taking up the larger trees it was necessary to dig much deeper in order to secure the roots, than in digging the smaller ones. These deep roots when set, were down beyond the reach of the grass roots, and hence the reason that they made the best growth. But in a portion of the orchard well cultivated, both large and small greatly exceeded the others in vigor.

The effect of cultivation on young trees was distinctly exhibited in one instance, when a line of apple trees had been planted along the roadside, one portion of the adjacent field, about eight feet from the trees, being cultivated in corn, imparted twice the growth to the trees that they had where grass occupied the adjacent field.

When the soil of the county is a strong, rich loam, there is less difference between cultivation and grass in the growth of young established orchards than in lighter soils; and the difference is less in deep than on shallow soils. As a general rule, young trees when six or eight years old, make a growth in a clean mellow soil about twice or three times as great as in compact grass sod.

One of the finest full-bearing orchards in the county belongs to Giles Landon. It shows in a remarkable degree the benefit of manure, and good treatment generally. It has been set out twenty-three years, and the tree tops have become so broad that cultivation has been discontinued, although the trees were set thirty-six feet apart. It is top-dressed every two years, and lightly pruned annually.

ROADS.

Mr. J. J. Thomas, above quoted, makes some excellent remarks in an essay upon Public Roads.

"Good roads," he says, "facilitate the attendance of public worship, bring lectures and public meetings within easy access, favor frequent mails, and thus become virtually civilizers and educators."

He did not propose to furnish a treatise on road-making, but there are two ways in which they may be improved with so small an outlay, that those will bear repeating at least three hundred times in each year. One mode of improvement is the removal of stones from the track. A single loose stone, which might be thrown out in two seconds, is sometimes struck by wagon-wheels fifty times a day, or more than ten thousand times in a year. Ten thousand blows of a sledge-hammer as hard, on one wagon, would probably demolish it entirely, and the stone does no less harm because it divides its blows among a hundred vehicles. There is therefore probably no investment that would pay a higher rate of profit than a few dollars' worth of work in clearing public carriage tracks of loose and fixed stones. If a single stone, thumped against ten thousand times a year, costs the community fifty dollars (that is, half a cent damage for each time), and could be removed even with a half minute in labor, or one-thousandth part of a day, then the fifty dollars would be saved by the application of two mills in United States currency, leaving a very handsome margin of profit. If these figures are wrong in any respect, please correct them as far as you please, and still the showing will be a good one.

Another method of improving the public roads, is by tile-draining. In some places, from one to two months, or even more, in each year, witness the passage of wagons, carriages and buggies, plowing through mud and ruts six inches to a foot deep, which would become hard and dry in one-fifth of the time, if one or two good tile-drains extended lengthwise with the track, with an opening for the water at every depression. The ditch might be partly or wholly filled with gravel above the tile. We often see large quantities of gravel drawn and deposited at much expense in the road-bed, when no adequate drainage has been provided. The gravel is spread on the soft earth, which as soon as soaked with rain or melting snow, becomes mixed with the gravel by passing vehicles, and in a short time the whole is cut into deep ruts. A perfect drainage below would prevent such a waste of labor, and give a hard and dry foundation with a smooth surface above.

SMALL FRUITS.

Speaking of small fruits, the remark is made that it is possible for three hundred bushels of strawberries to be grown on one acre. Two hundred bushels is not an extraordinary yield, yet one hundred bushels per acre might be over the average, for there is much poor culture. One hundred bushels of raspberries is a satisfactory yield, but often above the average. Currants, gooseberries and grapes yield generously, with good culture and congenial soil, and are highly profitable, if the best varieties are selected. The blackberry is perhaps the most profitable of all, in sections of country where it does not winter-kill.

ASSORTING AND PACKING APPLES.

Professor LAZENBY, of Cornell University, in a paper upon gathering and marketing apples, says that far too little attention is paid to this matter of assorting apples. Take three barrels of what is termed good fruit, as they are ordinarily put up, and divide them into two barrels of first and one of second quality. The two barrels will sell for more money, and give a better return than the three unassorted. They had a good illustration of this in their own experience, at the University, the past season. One of the practical lessons given to the horticultural students, in connection with the instruction in the class-room, is picking and barreling apples ready for shipment. This work is supplementary to a course of lectures upon fruit culture, which is given during the fall term. An experiment was conducted, which, in its results, clearly indicates the importance of carefully sorting and grading fruit for market. The students picked enough of the Tompkins County King apple to fill six barrels. Two bar-

rels were filled with the apples just as they came from the tree, without sorting. The remaining apples were carefully sorted into two grades, three barrels being "No. 1," and one barrel "No. 2." This fruit was shipped to a well-known commission house in New York City. The returns were as follows:

Three barrels Tompkins Co. King Apples, No. 1, at $3.50	$10 50
One barrel Tompkins Co. King Apples, No. 2, at $3.00	3 00
Two barrels Tompking Co. King Apples, ungraded, at $3.00	6 00

We see from these figures that the ungraded apples, though three-fourths of them were of the same quality as those graded and marked "No. 1," sold for the same price as the poorest one-fourth, which were marked "No. 2," causing no inconsiderable loss.

After determining into what grades the apples shall be sorted, the next operation is packing. This should be done by a careful, experionced hand. Two courses should be placed in the bottom of the barrel with the stems down; then the apples can be put in more rapidly, yet they should not be thrown or carelessly dropped in; but the hands should reach well down, so that none of the fruit is injured. When the barrel is one third full, it should be shaken gently—again when two-thirds filled, and once more when the barrel is oven full. Make it a rule, inflexible and relentless, that there shall be no "topping off" with large apples, with those of poorer quality in the center. See to it also that your barrels are of the proper size and neatly made. When the barrels are headed up, they should be plainly marked or branded with the name of the variety, the grade, and either the name of the orchard or the grower.

Among the questions discussed which, we think, is worthy of continued experimental investigation, is this:

What is the best Fertilizer for Fruit Trees, taking into account economy, health, vigor and productiveness of the trees and quality of the fruit?

QUINCE CULTURE.

The best conditions under which the quince flourishes is discussed at length. It has seemed strange to us that so useful a fruit, one that is so easily grown, should be so seldom seen in farmers' grounds, and where seen, so utterly neglected. We make the following extracts:

The quince loves a moist but not wet soil. If it is a little clayey it is no disadvantage.

To salt at the rate of four quarts to the tree; spreading around the tree as far as the roots extend, or a little farther is very beneficial.

Mr. Fowler stated that the quinces do not do well on sandy ground, mainly because the borer works more on light than on moist, heavy soils.

Mr. Moody stated that the quince flourished in Niagara County particularly on strong, heavy soils. He instanced the orchard of Dr. Woodward, forty or forty-five years old, which produces splendid crops. A temperature ten degrees below zero does not injure the quince.

Mr. Gray, of Orleans, thinks the best quince orchard in the country is in cool, moist soil.

Dr. Sylvester said that the best manure for the quince is swamp muck.

He had seen them do well on the frozen Green Mountains of Vermont.

A friend had some quince trees which had grown year by year, but never borne; at length he told his boys to kill the trees. They accordingly poured the old brine from the pork barrels around them. The consequence was they bore so abundantly that the trees had to be propped up.

Mr. Geo. Ellwanger said he considered Rea's Mammoth the best quince in the market. It is the most delicate and always commands a good price in the market. The Angers' is a good quince in the south or France, where the summer climate mellows it somewhat, but here it does not perfect itself. He believed in cultivating the quince to a single standard.

INSECTS.

Speaking of Insect Enemies, Mr. Greenman remarked respecting the codling moth that, a fine soil and climate for fruit avails us nothing so long as we have this enemy among us to prey upon the fruit. He found that the larvæ of the codling moth liked cotton batting better than any other material for nesting. He found that they only moved at night. Removing all the worms from the bands at night, they were filled again in the morning. But if they were all cleared in the morning, they remain clear at night. The apple containing the worm falls to the ground, and if the insect is sufficiently matured it will crawl up the tree the first night. He placed paper bands around his trees, and when protected in that way, about one apple in four was infested with worms. On trees unprotected, but one apple in six escaped.

SOLUBLE FLOWER-POTS.

We have received from Mr. Tuisco Greiner of Naples, Ontario Co., N. Y. a package of soluble pots for flowers or vegetables. These pots are a compound "chiefly of rich garden soil and fresh cow-manure" and any unskilled person, by the use of Mr. Greiner's press can make from 1,200 to 1,500 pots in one day. Then they have to be dried 24 hours in the sun or a warm room and are ready for use. In place of garden soil and cow-manure, muck, yellow loam and any kind of dry commercial fertilizer may be added according to the requirements of the plants to be grown, though the admixture of fresh, clean cow-manure always improves their quality. For growing early plants, the pots should be filled with fine, rich, loose soil and the seeds planted. The pot when once soaked full of water acts, it is claimed, somewhat like a sponge, supplying the plant with moisture for a considerable time. When transplanting time comes, the pot, containing the plant is placed in the ground so that the roots are not disturbed. The moisture of the soil soon dissolves the pots, and the roots imbibe the nourishment contained in them. Thus the operation of transplanting "is always safe and sure" "Plants may therefore be started earlier and, as they are not put back by transplanting, gardeners are enabled, by the use of soluble pots, to have egg-plants, tomatoes and other vegetables come to maturity, or flowers to bloom, much earlier than if grown in the old way."

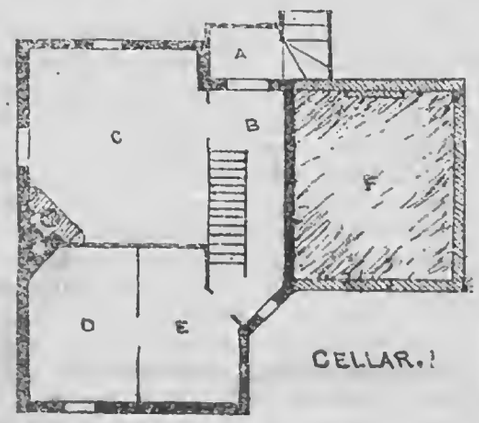
The above and much more are claimed by Mr. Greiner for the soluble pots. We shall try them and in due time give our own estimate of their value.

Rural Architecture.

COTTAGE.

L. F. GRAETHER, CIVIL ENGINEER.

The cuts represent a small, attractive cottage suited for a family of limited means. The plans are described as follows, viz.:



Cellar.—Seven feet in the clear; A, rear-entry; B, passage; C, wash-house, (12 by 14 ft.); D & E, cellars; F, unexcavated space under kitchen.

First Story.—nine feet eight inches in clear; A, piazza (6 by 24 ft.) with front steps; B, hall (6 by 18 ft.) with main stairs to second story; C, parlor (12 by 16 ft.); D, dining-room (13 by 15 ft.); E, kitchen (12 by 16 ft.) with sink etc., and pantry G, (4 by 6 ft.); F, rear piazza with steps leading to yard.

Second Story.—Nine feet in clear; E, hall; D, bed-room (13 by 15 ft.); A, bed-room, (8 by 12 ft.); B, bed-room (11 by 12 ft.); C, closets; E & F, roofs for piazzas and the kitchen, etc.

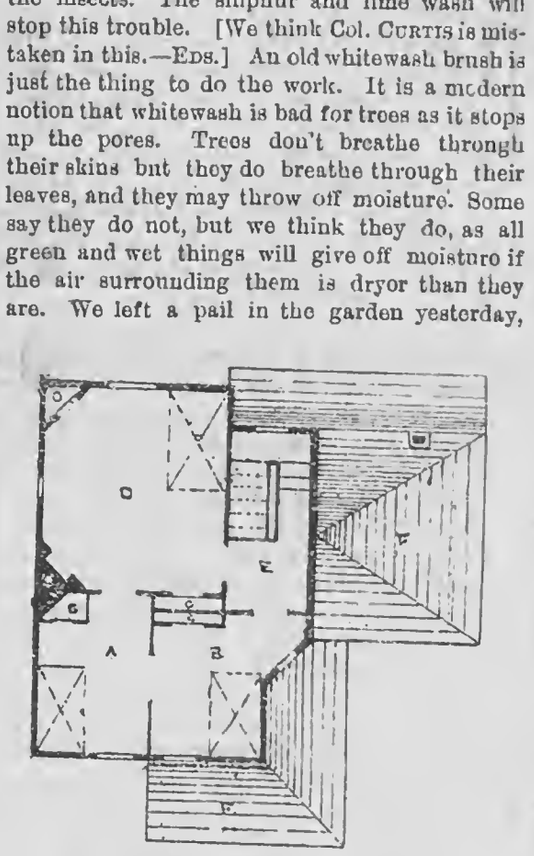
The expense of erection of such a building will (according to finish and locality) range from $1500 00 to $1700.00.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

The young pear trees are full of sprouts and suckers which must be cut off without delay, as they rob the tree of a great deal of sap.



1st Story.

will be more liable to blow off; so these limbs must be cut down at least half of their hight. Our grandmothers used to whitewash their trees as they thought it healthy for them. They were right. We are going to mix fine sulphur with the lime—a half pound of sulphur to two quarts of lime—and smear every tree with the mixture. It will kill or keep away (?) all of the insects and do so much to prevent blight. The leaves of some trees are now punctured and curling up on account of the depredations of the insects. The sulphur and lime wash will stop this trouble. [We think Col. Curtis is mistaken in this.—Eds.] An old whitewash brush is just the thing to do the work. It is a modern notion that whitewash is bad for trees as it stops up the pores. Trees don't breathe through their skins but they do breathe through their leaves, and they may throw off moisture. Some say they do not, but we think they do, as all green and wet things will give off moisture if the air surrounding them is dryer than they are. We left a pail in the garden yesterday,

2nd Story.

and to-day it has become so dry that it leaks. It has given out the moisture in the staves and shrunken up just so much. When the sun shines hot, moisture rises from a green tree, just as it did from the empty pail, and the paint did not prevent it, nor will whitewash keep a tree from emitting moisture. This is the reason why newly-set trees should be mulched to keep the ground damp at the roots so the supply of moisture will not fail. The root must feed the top.

We have been planting some of the dipper

COTTAGE—ELEVATION.

When trees are grafted above the ground, that is not in the root, they are more liable to throw out these suckers than when grafted below the surface of the earth. The sprouts come out from the old stock. Some of our trees have gourd seed. These gourds grow with a handle, and when ripe, they may be sawed in two and make handy dippers, or vessels to hold water for many uses. They become very hard and are tough and strong. In some of the old countries they are used almost altogether for drinking vessels, and in the kitchen. If we succeed, the Rural shall have all the surplus seed and a dipper too.

The sod was thick and tough in the baby's nut grove, so it has been planted with potatoes. The potatoes were dropped on the sod—right in the grass, and then oat straw was spread on top of them a foot thick. We are waiting now for the potatoes to come up, and congratulating ourselves that there will be no necessity for hoeing that crop, and that at the same time the grass will all be killed and the trees do much better. If a tuft of grass shows itself, a forkfull of straw is put on the top of it and trampled down.

Where hens or other poultry are confined in a small yard, it should be dug over frequently. The fresh earth is healthy and at the same time the surface of the ground which becomes putrid, by being turned under is thoroughly deodorized by the action of the earth. This reminds us how common it is to have water-closets in the country so constructed that they become pestilential. Usually, a pit is dug in the ground near the house, and this is left for years with its accumulation of filth and corruption, poisoning the air and the water veins, and often creating fevers and causing death. We know of a closet of this sort under a part of the dwelling, which we are sure killed two wives of the owner, and has made the third one a feeble woman, undermining her naturally good health. The husband who prides himself in having everything handy, would be dead too, but he is out-of-doors so much that the malarial poison is counteracted by the abundance of fresh air. Every privy in the country should be on the top of the ground, and the contents in warm weather be kept covered with earth or plaster. As soon as a wheelbarrow load accumulates, it should be taken away. The indifference of sensible people to this important thing is astonishing. Many an infant and child is laid away in the grave because of foul privies.

The gapes have begun with the oldest chickens. Every one has these spasms, and before we knew it one was dead. We are trying the experiment of making them inhale tobacco smoke. They are put into a basket and covered up, and the tobacco is set to burning in an old kettle underneath. The chickens are left in the basket and carefully watched until they appear dumb, when they are taken out. They soon revive and the spasms are lessened. We hope to cure them by a few trials.

Miscellaneous

VAN'S VIEWS.

SOWING GRAIN.

The sowing season is past, but there are some points which came up this spring which I would like to see discussed a little more. One was the amount of seed to be sown per acre. Most of the farmers hereabout sow one and three-quarter bushels of wheat or three bushels of oats per acre; and I used to think that it was better to use two bushels of wheat, but a near neighbor, one of our best farmers, I always noticed had "No. 1" wheat, while most of us had to sell ours as "No. 2." Last summer he and I were talking on the subject and he said that the reason his wheat ranked higher than ours lay in the fact that his was sown thinner, and as it stood thinner the grain filled out better; and as the difference between "1" and "2" wheat is that one must be plump while the other may be shrunken, his argument seems good. In 1875 he raised forty-two bushels per acre, sowing five pecks of seed, and his crops are always good.

In talking of this matter with a number of farmers, one day, the amount to be sown on rich and poor land was spoken of, and while two agreed with me that rich land needed less seed than poor, the other five thought that the reverse was true. Now, I claim that if your land is rich, your grain will stool out and you need less seed. I read not long since of a stool of rye containing 109 heads, the product of one kernel. It grew in a field of winter wheat where the wheat had killed out. Henry Coleman, of England, counted 95 heads from one kernel of wheat, and says: "I sent out my drill to an eight-acre field with seven bushels of wheat to be sown; by a mistake in setting the drill my man found, when he had sown half the field, that he had sowed but two pecks per acre; not wishing to bring back part of the seed and let me know of his mistake, he set the drill to sow five pecks of seed per acre and finished the piece. I did not know of the error but noticed that part looked very thin; but at harvest the thin part yielded best and the man confessed his mistake."

A well developed head contains, on the average, 40 grains; I have counted 68 in a head. If we sow one bushel per acre, and each grain produces one head—if it grows it can't do less—we shall have 40 bushels to the acre. The average in our State is about 13 bushels.

Prepare your land well, make it smooth so that when you sow, your grain will be covered evenly. Use less seed and there will be thousands of dollars annually saved. A heavy crop has been grown by "dibbing in" six quarts per acre. Ohio alone has in a single year sown two million acres of wheat. One-half bushel of seed per acre saved, would make a difference of one million bushels in a single State, which would send an agricultural paper to a good many homes which are now without one.

ROOT CROPS.

Our main dependendence is and must continue to be Yellow Globe Mangel-wurzel. I will sow mine this year by stopping up all but four of the holes in my drill—the Planet—which, by the way, can't be beat for garden seed, and is very useful in sowing field beets and fodder corn—so as to drop the seed in clumps ten inches apart, saving seed and thinning and much trouble in hoeing. We sow Beets, Mangels and Rutabagas from May 20 till June 15; later is not profitable, and earlier is not very desirable as it makes coarser roots and the cattle do not like them as well; and the rutabagas, if too old, will make the milk and butter taste.

POCKET MONEY.

I am glad to see these articles in the RURAL. I well remember, when a little lad, how proud I felt when I sold my first litter of chicks, which "Old Brownie" had hatched and raised. I kept on increasing my flock till I had over sixty nice large Light Brahmas, which alas! were one night "taken" by some prowlers. I felt my loss keenly, but was not so sad as I was when, a few years before, I awoke one morning to find that my first love—"Old Brownie"—had fallen victim to a skunk during the night. I was sure that there would never again be a hen in my possession that would be her equal—and there never has been. I have had fine fowls which have been admired by many, but I have never had another "Old Brownie."

But the worst thing possible is to give a boy or girl, say, a motherless lamb, and then after it has grown—and owing to its owner's care—attained an extra size, let some butcher have it and pocket the money. The boy will vow that "he will get away from the farm to where things are *his*." He can't see the logic of its being Johnny's lamb but father's sheep.

Brown Co., Wis.

A GRANGE AGENCY—IS IT EXCEPTIONAL?

THE Mississippi farmers who have attached themselves to that institution known as the "Patrons of Husbandry," have been taught to believe that the Grange Agency was a large and beneficent concern in Memphis, where a man "initiated in all the degrees," posted in the "secret work," might go and "get the worth of his money in bargains," wagons of better make, more durable material—and cheaper by ten dollars than those to be purchased anywhere else. There was the same cry about sewing-machines—"a first-class sewing-machine for ten dollars less than it could be bought of the manufacturers." Flour, sugar and coffee were sold by retail at very low rates, and in short the Agency proposed to be a nursing-mother to the poor husbandman.

A certain gentleman of my acquaintance, a farmer, having by dint of hard work and close saving accumulated a few hundreds, resolved to "try the Agency" in the purchasing of supplies—a sewing-machine for his wife and a wagon for himself. Arriving in the city, my friend sauntered along Front Street, reading the signs, and at length discovered "Grange Agency" on the door of a dingy building, and going up the greasy, narrow stairs, encountered an unprepossessing and shabby gentleman, who in response to the initiated Granger's signs, displayed none of the anticipated warmth and interest of mystic brotherhood, but summarily turned him over to a "clerk," who conducted him to the warehouse of a neighboring establishment, and from his underling he learned that the "Agency" was for the most part a nominal concern, whose principal gains were from "drumming." The name "Grange Agency" was the potent magnet that drew up those greasy stairs the "Patrons of Husbandry" whose trade by those astute drummers was deftly transferred to the wholesale merchant next door, who, of course, paid a certain percentage on the custom thus secured. After examining samples of flour, sugar, coffee and rice, my friend decided to "look around a little before closing the trade;" and so, going from one place to another, happened to meet with a friend, a clever fellow, residing in the city, who without more ado took him to a house where he "did business," and with a word to the merchant, and a hint to my friend, secured his supplies of meat, flour, sugar, coffee and rice at a cent and a half less than the rates he would have had to pay at the "Grange Agency"—this firm, a house which made no pretensions to favoring farmers as such!

Thus ends the talk about doing away with "middlemen," mere "bubbles" fit only to burst; for, looking at the matter from a plain, common-sense, practical stand-point, what could we do without middlemen and middlewomen? It is they who bring capital and labor together, and even co-operation fails without them—as a sandy field yields no returns if burnt by drought. Capital is a reservoir, labor the field, the middleman the aqueduct conveying the life-giving fluid to the thirsty land. The middleman or factor, living in the busy town, is *au fait* with city prices, city regulations, and city fashions; and as superior to a countryman in driving a bargain as the practiced swordsman in the use of his weapon excels a mere novice. Many a time have I proven the advantage of a middlewoman friend. When in want of a stylish, fashionable costume, I greatly prefer to depend on her *taste* and *economy* in laying out my funds. She will not forget in her shopping rounds the minutest appurtenance of the toilet—there will be gloves, necktie, parasol and fan to *match* the dress, and the trimmings will be *comme il faut;* whereas one of our good farmers' wives, branching out to do a "day's trading," as she calls it, gets her mind so perplexed with the multitude of little things she wants to get at once, that she comes home minus the most important. Her liege lord in the city loses his head at the "sights," and is no more fit to trade with the quick-witted salesman without a pilot middleman than he is to talk to a Turk without an interpreter.

PERLE PERDU.

FROM CUSTER COUNTY, COLORADO.

WET MOUNTAIN VALLEY, Ula, Custer Co., Col.

Doubtless the name Wet Mountain Valley, implies a place where water is at least abundant. It was as badly named as the ridiculously named neighboring mining region which an unsound mind, having no idea above cow-driving, christened the Hardscrabble Mining District. Such an idiotic naming of a mineral district has kept thousands of people away from its great riches, and thousands, too, eager to secure Government's fertile lands in between mountain ranges, have held aloof from coming to the beautiful valley here mentioned. There is in it just the water needed, no more, no less. There are no swamps, no mirey places, no water-covered tracts. Grape Creek, Texas Creek, Muddy River, whose water is as clear as crystals, and tributaries traverse the valley. These waters are cold, clear, rapid in their course from their mountain birth-places to the Arkansas River, and are full of the finest American fish—the wiley, yet luscious mountain trout.

In length from northwest to southeast the valley is fifty miles, with an average width of ten miles. It hugs closely the Grand Canon of the Arkansas at its northwest extremity, in Fremont County, and crossing Custer County, ends in Huerfano County. It is crossed by ranges 71, 72, 73 and 74, west of the 6th principal meridian, latitude 38° 15′ north. Its climate is faultless The atmosphere is clear, transparent, bracing; giving new life to worn and weary lungs, healing universally all catarrhal and bronchial affections, and insuring a new lease of life to all dyspeptics and debilitated people from the east and south. Cattle feed and keep in excellent condition all the year, not requiring any more care than to herd them once yearly when they are to be branded. These nutritious mountain-side and valley grasses prepare stock for the Kansas City market better than any cattle fed on the plains of Kansas and Nebraska. The large hay crop cut in the valley is pressed, baled, and goes to the markets of Colorado Springs, Pueblo and Canon City, where it brings very remunerative prices. No fencing is necessary, except for the small fields of 100 to 1,000 acres reserved for hay and grains.

The soil is a dark, rich, deep, very light loam, that does not pack down for years after being once cultivated. It is not encumbered by brush or trees, is easily broken, and enriches itself by the yearly decomposition forever going on upon the vast, wide-spread breasts of the grand mountains which upon the east and west slope towards the center of the valley. Fifty bushels of wheat—of a quality too to make the premium flour of the world—60 to 85 bushels of oats and barley; 325 to 450 bushels of potatoes, to the acre; 35 to 40 bushels of peas; three to five tons of hay—such are the products of mountain-fertilized soil. Forests of Pine, Spruce, Poplar and Balsam, furnish free wood for building and fuel. These forests are on the great mountain slopes on either side. The many mining camps of Silver Circle, Ula, Texas Creek and Hardscrabble mining districts, afford ready cash market for all the produce of the valley except hay, and these camps are rapidly swelling in numbers and in population. Potatoes are, on an average, the year round paid for at the rate of two cents per pound or $1.20 per bushel. Those who cultivate them plow, plant and dig without using hoe, cultivator or shovel-plow. Weeds are comparatively unknown. Crops grow rankly and quickly and mature in very much shorter time than similar crops do East. Rains fall during August and the latter part of July. Annoying, long, drenching rains are unknown. Storms here are all short for, just west and south of here are made up the storms which move eastward to the Atlantic, and, being made up for a long course, they cannot stop to give us much of their volume for fear, as it were, they might not have force enough to do their wonted work in the far-away east and south.

The Canon City Branch of the Denver & Rio Grande Railroad from Pueblo terminates thirty miles east of the valley. At Pueblo it connects with the Atchison, Topeka & Santa Fe road—for Kansas City, Chicago, and all eastern points. An extension of this road is surveyed into the valley, terminating at Ula—its central point; Rosita, 12 miles distant, is purely a mining camp, 9 800 feet above the sea level. It has no garden spots, is too high for permanent good health, consequently Ula, of the valley, 1,200 feet lower, is the central commercial point of Custer County.

On either side of Wet Mountain Valley, all along its line, are wide crevices of precious ores. There is ample working room in this dual mineral belt for a quarter of a million of sturdy miners. Their number doubles annually, thus increasing the need of having tens of thousands more people come and take up these valley lands which are open to all as pre-emptions and homesteads. Of the 500 square miles of agricultural and grazing lands comprised within Wet Mountain Valley, not one-twentieth of the land is, as yet, claimed. It is open to all. As agricultural land it is unexcelled; as grazing lands they have no known rival; as a climate it is the "perfect land" of *savants* and travelers; as an adjunct of mining vicinities it has advantages of transportation and proximity to central cities not possessed by any other metaliferous region of our own or any other country; as a land of wonders, such as Nature sometimes fashions, its scenery transcends all other views on earth.

Deer, elk, beaver, mountain sheep, wild turkey, grouse are the natives, for we are 175 miles east of even an Indian, stray or tramp. Occasionally, a solitary cabin in the center of a few hundred acres of fertile bottom-land is found. All such lands are being taken up rapidly.

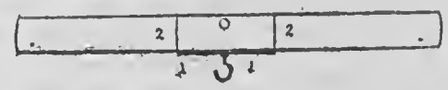
This valley was located first by a German colony; Englishmen of means, with a few Americans came next, and have enriched themselves by cattle-growing, horse-herding, and tending grass lands. No less than 30,000 bales of hay were cut here last season. The Beckwith Bros., of the valley, have 15,000 head of fine cattle. Messrs. Frink & Cole, retired eastern merchants, have 4,000 head and many horses. Messrs. Leonard and Frank Hunter, brothers and Englishmen, have large herds and many fine horses. "Trapper" Smith, a graduate of Cambridge, owns 250 heads of blooded horses. Mr. John Waits, County Commissioner, has a splendid place at the northern end of the valley, where he has a stately mansion, which usually is filled with the *elite* of Pueblo and Canon City during the summer season. Dr. Bell, of Manitou Springs, has a large ranch and a spacious cheese-factory in the valley. His cut of hay off from the cheese farm last season was 900 tons. The Rev. Major Goodwin, a pensioned relic of Lunday's Lane, has a fine place. Mr. Goodwin is mining, is 50 years old, sound, hale and sprightly. Mr. Wm. Scofield has a fine ranch and a goodly herd of American cattle. Joseph A. Davis, County Clerk, has a good farm, is among the foremost men of the valley, and is the people's choice for the legislature. Mr. Jacob Risser, Wm. Hall, Frank Hall, Wm. Tall, H. B. Harrison, are English gentlemen of means; Mr. Schwab, a great grower of potatoes, Chas. Sieber, a successful cattle man, Reginald S. Sweetland, J. H. Tebbs, a school-teacher, Messrs. Jarvis & Sons and Mr. Ed. Martin, have homes in the valley. Mr. A. B. Johnson, once a big corn importer across the plains, and familiarly called "Corn" Johnson, has a large farm, cattle, horses, and owns some fine mines of gold and silver. Herr Kantzantin & Sons have a good ranch and some rich mines also. Wm. Wood owns good property. Captain Horn, after whom Horn's Peak on the Range is named, is a retired merchant from Philadelphia. He has a splendid location on Grape Creek, just across the valley from Rosita, and grows, with little pains, astonishly large crops. Mr. J. T. McNeally, Chairman of the Republican Central Committee, is the legal-law depository of the valley. Messrs. Mix and Onderdonk, of Batavia, N. Y., have recently purchased the Hilburn Ranch, in the eastern end of valley. The Messrs. Snyder Bros., Germans, have erected a large still for the purpose of manufacturing whisky from potatoes. On the road from Rosita to Mocha Pass, "English Billy," familiarly named, has a fine ranch. His hospitable home is made a stopping-place for all who make the San Juan country *via* Mocha Pass. Here he entertains all alike, rich and poor, and his name has become a household word in Wet Mountain Valley. Samuel Shepard, Assessor Gove, Messrs. Hayden, Burrows, Lowther. Rieiters, Lawrence, Palmer, Meyers, Duckets (who also own valuable mines), Townsend, Lansendorfer, Gillaud (an excellent family), Wheeler, Gen. R. K. Swift (who was one of the stirring bankers of Chicago 20 years ago), Falkenburg (who is Postmaster), and many others have locations in the vast mountain valley. All are prosperous, and are ready to welcome thousands of new neighbors who come to settle.

Two prospectors, W. H. Holmes and Edward Egglistone, locate mines for farmers and others for an one-half interest doing all the work under their own experienced superintendence. Already they have such partners as Hon. Geo. M. Chilcott, Hon. Sheldon C. Hall, Justice Tucker, Attorney John W. Warner of Leon, Iowa, Col. W. M. Strait, H. K. Pinkney, Mrs. Judge Wilbur F. Stone, Banker, J. N. Pierce, Jr. and many others. I do not know of any other place on our continent, and I have been coursing over it for 17 years, where the industrious yeoman can so handily unite fortune-gaining as here; where he can be miner during winter and farmer during summer; and, in all cases, when a family has some dear one whose health is impaired, who is sickly East, or South, this land certainly, should be sought and once found will ever afterwards be prized.

H. H. HORTON.

TEAMSTER'S VADE-MECUM.

I AM using a device which I prize very highly, and since I do not design to obtain letters patent upon it, or allow others to do so, I offer it to the RURAL folks. It is an improvement upon the swivel clevis.



2, 2, are ⅜ bolts, passing through the evener and fastening on rear of the evener, the plate of iron 1, 1. 3, is a short hook playing freely in the plate 1, 1.

On the wagon, the hook is out of the way under the hammer-strap. Its uses: if on wish to "double up" a steep hill, hook on to the end of the wagon tongue and ascend. Are your horses' feet in ground so soft that they cannot pull the load after them? hook on to the end of the tongue again, and your horses with feet on hard ground, can now pull the load across the soft spot. Is the ice doubtful? put greator distance between your horses and the load.

Its numerous uses will readily suggest themselves to every teamster. Its chief recommendation is that you always have it with you when you need it. Any blacksmith can put one on at a few cents' cost. Try one and you would not trade it even for a "Cricket."

That last assertion is made without ever having seen a "Cricket," of course.

Harlan Co., Nebraska. R. H. CRANE.

DESTRUCTIVE FIRE.

ON the night of May 19th, the extensive factories of Russell & Co., makers of the widely known Massillon Thresher, at Massillon, Ohio, were partly destroyed by fire. They write us that—"Undismayed by the terrible fire of last night, by which our Iron Working, Belting and Wagon Making Departments were almost entirely destroyed, we have already arranged for machinery to replace that lost, and will resume work on Monday next with undimished zeal. But one day's delay has been caused by a fire involving a loss of a hundred thousand dollars. We are prepared to fill orders promptly, and hope that our misfortune will occasion our friends no inconvenience."

We sympathize with them in this misfortune, but admire their pluck. May the orders flow in steadily!

EXCERPTS FROM BINGHAMPTON FARMERS' CLUB.

"How shall we interest young men most in the pursuit of Agriculture?"

If we would interest young men in agriculture we must make home and the farm pleasant and agreeable. We must make society in the country attractive; must organize circles for social and intellectual improvement in their own neighborhood. Let them have something they can call their own; don't let the boy's colt be the father's horse. Teach them not only how to get money, but how to spend it. Enlist them in the art of doing business themselves. Gain their confidence; try to understand them. In a family of boys there may be as many different dispositions and abilities to fill different positions as there are boys; *provide good reading.* J. H.

MEETING OF MICHIGAN FRUIT GROWERS.

THE summer meeting of the Michigan State Pomological Society will occur in the city of Jackson, June 18, 19 and 20. There will be an exhibition of fruits ripe at that date and a general discussion upon topics of interest. Horticultural Societies in other States are cordially invited to send delegates. If the Secretary is notified of the attendance of horticulturists from abroad, provision will be made for their reception.

CHAS. W. GARFIELD, Sec.

Grand Rapids, Mich.

HORTICULTURAL MEETING.

THE third annual gathering of the nurserymen, florists, seedsmen and those of kindred interests will take place at Rochester, N. Y., commencing June 19, and continuing three days. Every person interested in horticultural pursuits is invited to be present, and will receive a cordial welcome. Specimens of cions, seeds, fruits flowers, implements etc., are requested. June 19, committees will be appointed and President's address delivered; 20th, the election of officers, reports and discussion; 21st, address, reports and discussions continued.

Pomological.

CAN WE HAVE BETTER FRUIT.—No. 2.

GEN. W. H. NOBLE, BRIDGEPORT, CT.

In my late partial answer to this question, I told of the only two ways yet revealed for bettering the kind of animals or plants, namely: breeding in-and-in and cross-breeding. VAN MONS' method with fruits, essentially breeding in-and-in, I gave in full detail. The overshadowing and more lasting results of cross-breeding, and the little known of his wondrous work, seemed to call for a rehearsal of its routine. I have strong hope that its study will disclose hidden ways and new helps to better fruits. About this I shall say something beyond.

The other way, that of cross-breeding, was the method of THOMAS ANDREW KNIGHT, President of England's Great Horticultural Society. He was a contemporary of VAN MONS and the peer of any to whom we owe fine fruits. Before his time the skilled breeders of England had stocked her pastures with the finest domestic animals in the world. Judicious mating and cross-breeding were the secrets of their success. That method's wondrous and unfailing work Mr. KNIGHT applied in plant life to the raising of fine fruits. The best varieties in each kind were crossed with their like, through the sexuality of their flowers, by ways familiar to all adepts. You cut off the stamens from that plant which you desire to have mother of your fine fruit; then at the first opening of its blossom, dust on its pistil the pollen of the paternal flower; and next, in some way, shut out all chance of mixture from the pollen of other blossoms. The fruit from such crops, ought in theory to yield you kinds bespoaking their parentage, and of improved quality. But somehow the results of such crossings do not tally very closely with our theory. Either in mating our kinds we are too careless about their purity and high score in qualities essential to a perfect fruit, or nature's ways, through which come our fine chance seedlings, are not "yet found out in our philosophy." We shall yet by study reach the mystery, which baffles our hopes and in some degree veils from us sure pathways to more perfect fruits. Yet, in face of all this uncertainty, the world has rightly settled down on cross-breeding as the only reliable method for continuous improvement in animals or fruit. Through it, Mr. KNIGHT and others since his time, have presented us many choice varieties. The theory of cross-breeding was not original with him, as was with VAN MONS the special method of his work; but Mr. KNIGHT so thoroughly tested cross-breeding, as a sure path to enduring and higher excellence in fruits, that since his time it has been the one hope of the garden or the orchard.

Yet I do not believe the best estate of animals or plants is to be gained by the exclusive use of either in-and-in or cross-breeding. The law that like produces like rules either plan.

To in-and-in breeding, rigorously following a single line of parentage with special purpose up to a certain point, we owe the first signal lift toward excellence. Up to that point for a time it helps with wondrous force and change. At any stage, in skillful hands, it's a sure method for any special betterment in the offspring. Yet as a system, it does not follow out its early promise. Beyond a certain point, it has always begotten feebleness, and ofttimes a drift backward, toward the rude types from which improvement sprang.

In animals especially, both flesh and spirit flag from too closely breeding in-and-in. Stamina and gains are only kept and pushed by crossing the fittest family strains, each in its kind. But I think the unlike sexual nature in plants and animals, somewhat relieves the former from strict compliance with rules essential to bring better specimens to the herd. The great law of like to like, while it concerns either, does not so strenuously demand diverse families of like in fruits whose impregnation follows very different conditions.

But neither in animals nor fruits has careful cross-breeding met like signal failure, or any stay or limit to improvement. This means, of course, judicious mating of the best blood and qualities. It demands in the orchard both upon tree and product, a close watch on the best estate and choice of parentage. The tree must be healthy, vigorous and resistant to all the ills that its kind is heir to. The fruits chosen as the parents and progenitors of a large planting should score up to the highest standard of merit, in size, season, keeping qualities and early ripening. Through careful crosses of such, thus forecasting a likely progeny, there seems hardly a limit to our advance. For example, why not have pears in every season, rivaling in size the Duchesse d' Angouleme, and vying in texture and aroma with the luscious Seckel; peaches, not only like so many of to-day, looking close back upon "winter lingering in the lap of spring," but greeting us with a Merry Christmas and a Happy New Year. I have had them without care, large, juicy and delicious, crowning the festive board at the November "Thanksgiving." I think they would have held good for weeks longer.

Now though cross-breeding is the one accepted way for better fruits, the possible conditions of impurity therein deserve our heed. It would be well to ask how true a cross that is, from whose seedlings we expect fine fruit. Whether some hindrances, or hidden taints, do not so mix things in our mating that we get but a lot of mongrel crudeness oftener than ancestral likeness or excellence. The secret of fruit-tree life and growth, so studied and disclosed by VAN MONS, deserves most careful note. The mighty part which the root plays in the life and quality of the tree and its product, should never be slighted as a motor toward either deterioration or betterment. There is, down in its laboratory, some secret alchemy, distilling excellence or crudeness, which borne up to the seed-germ on the vital current of the sap, gives to it a divine quickening, or a sorry taint. Though our seedling may rejoice us by its great advance, yet when in the progression of our crosses, we graft its cion on some crude though thrifty stock, how do we know that the base blood from the root has not left in its seed-germ a taint which that germ will reproduce? Thus, or in some other way, as in the young of animals, some slumbering race-taint, dating away back to a careless or stolen cross, may crop out, to disappoint and dishearten trial.

Though we know much about how better fruits have come and should be sought, we have not yet found out all the faculties and vital forces of the fruit tree. They await to be unmasked by some new VAN MONS or KNIGHT. Such may define unerring laws through which better kinds may progressively and surely follow crosses.

Now, VAN MONS never forgot how much the root had to do with the seed above it and its fruitage. No root-taint from a crude and puckery pear, was ever run by him into his trials. Through all his life-work, he never planted a seed which grew not on its own roots. To this, in part, we should ascribe the rapid improvement of his seedlings.

Your recent correspondent, Mr. D. S. MARVIN, in his able article on grape improvement, marks a new feature in this root power. His suggestive trials are worthy of all praise, and are full of hope. We rarely find a mind so instinctive as to method, and so patient in practice. He is in grape culture a new VAN MONS. I have seen nothing so original in American Horticulture. Yet it is a simple following of nature's ways and laws. Like all great truths, they are plain and easy, when once you have reached their measurement and work. In their present stage of his development, they deserve close scan, and brighter hopes in the vineyard. His sanguine expectations are warranted by all we know about how the root shapes the life and product of the plant. An intense interest awaits the results which Mr. Marvin seeks. We watch in faith and hope for better grapes. In even these early years of American horticultural life, the American grape has come close up to the excellence, for which the Old-World species, has had the work and chance of all man's life on earth.

Now for a marked example of the way that fruit crosses "gang awry." The CLAPP'S Favorite Pear claims parentage from the Bartlett and Flemish Beauty. But it is unlike, and I think inferior to either. Such fruits should have yielded us a child of higher excellence. But how true a cross of pure parental blood was the CLAPP? It may be that the flowers were skillfully mated, with due care that no other than the parental pollen should mix therein. But how about the root? Surely no Bartlett or Flemish Beauty roots were likely to have nourished the seed which grew up to be the CLAPP, or bore the pollen which impregnated its germ. If VAN MONS and MARVIN are right about what the root has to do with the seed and fruitage, what is the CLAPP'S Favorite but a chance seedling, though the flowers of each were carefully mated with the purpose of a cross? Did there no old taint or newer crudeness crop out in these seedlings? Now, is it not plain from all this, that the footsteps of your search for better fruits must follow the laws of plant-life and its schools of trial? Otherwise you are but groping in the dark after results, whose reality may mightily disappoint.

In this hope and search for better fruits, there is more bound up than the beauty or luxuriousness of their harvest. There is health and comfort and refinement in fruit trees loaded with their glowing and bounteous crops. There is joy in the home. There is pleasure at every meal and at every step. The sight and memories of heaped-up fruits in the orchard, and a winter's store in the cellar, dwell with us through life. The plentiful offering of luscious fruits at the social hours and on the family table, and their unstinted use all throughout every avenue of life bring joy and blessings to all the walks and markets and marts of men. Their full measures brim with comfort and content. They who gain for us better kinds; they who show how better to raise and keep them; they who study out, and defend against the ills and the insects that harm the fruit tree or its product; they who largely plant and make plentiful fine kinds; they who year by year study and tell us what and how to cultivate for a better fruitage, are great human benefactors.

Our people hunger for finer fruits. Every new one promising qualities desired, or so heralded, is eagerly bought. An endless opportunity stretches in the future beyond our comparatively brief trials. No people can boast such a sun, soil, climate and atmospheric conditions, unitedly auspicious of a glorious repast. Hardly a fruit grown on earth, but somewhere in our territory finds a congenial home. Over the great majority of our States, every product of the temperate latitudes rewards culture. Many share with the tropics their luscious fruits. The orange, banana, lemon, citron, guava, plum and peach, flourish side by side in Florida. The new fruits of Japan will doubtless find congenial homes far north of New Orleans, where the new persimmons have grown crops for years. The field is unlimited, the promise bright, the reward sure. All who would here push on the work of VAN MONS and KNIGHT to a more glorious fruitage, find everything apt, and a people eager to second their thorough exhaustion of the possible in pomology. Therein sleep secrets, wonders and glories towards whose revealing, those great pioneers were only LIVINGSTONES and STANLEYS, in the realm of fruits.

But the question is: how can the work and search best be done to hurry up surely and grandly the better fruits? Something more than individual enterprise is needed; some thing beyond the chance and stretch of individual life; something more continuous and concentrated than the grand work of our National Pomological Society. Time, place, and the men must be had to hold fast patient trials, and crown them with finer tested fruits. The need is of tireless skill, with well appointed help through years of trials and triumphs. This work must be so hedged about with an authority and trust, that it will command the faith of those seeking better fruits.

In the feverish hurry of our American life, infecting as well the nursery as other marts, there are neither means, time, space, nor patience, to face the needed trial and delay. The business of ready gain, is the great end there. Give them a better fruit, and in print and tinted picture, the world will soon know all its deserts, if not much more. It is discovery of fine fruits, not their sale, we seek. The work of VAN MONS and KNIGHT was not done at a commercial nursery, but under the ease and patience of delay, in well-endowed institutions. I know that many fine fruits have come from such as LEROY, and REEVES and POITEAU. But as a rule, you need not hope for a commercial nursery, right along, to plant the well-bred seed, and patiently wait its fruiting, under all the conditions essential to success.

I hope some fruit-loving capitalist will, by and-by, endow a fruit garden, devoted to raising and testing new kinds, and new ways of infusing into the germs a drift toward the better sorts at every new trial. I know already of one enthusiastic lover of fine late winter fruit, who proposes to devote in some way $10,000 to encourage the raising of pears, which will stretch with the apple almost and even quite round the year. It is a bright idea on the line of a needed advance. Suppose ten or more such men should each give therefor like sums, and somewhere, in Virginia say, organize a Horticultural Garden to originate and test new fruits, or, what seems to me better still, let the Government endow such an institution, accepting individual gifts and help, and admitting individual direction. What more paternal or divine governmental work could be devised? The Agricultural Bureau, which covets the dignity of a Department, might then be lifted from its desk-work and seed distribution, by some stout Horticultural help.

At any rate, our National Pomological Society should no longer delay the duty of harnessing into enduring and pensioned search for better fruits this divine climate of ours, and the manifest leaning of our seedlings to improvement. I commend this work and duty, to the venerable and very able President of that Society. It would grandly wind up his valued service as its head, and crown years full of honor and respect, to engineer the foundation of such a national institution. Let it be endowed by Government and by individuals as a branch of either the Agricultural Department, or of the Smithsonian Institute, admitting directors, trustees and management outside of politics.

Floricultural.

HUMEA ELEGANS PURPUREA.

W. C. L. DREW.

THIS graceful biennial may be used to great advantage to give hight and lightness to the centers of flower beds and garden vases, its showers of drooping, grass-like blossoms, making it charmingly adapted to such situations, serving the same purpose as do ornamental grasses in a bouquet. It can also be used most effectively as a back-ground to beds of standard Fuchsias and other tall flowers, where they skirt piazzas and the walls of the house.

It would be useless to plant the Humea for show purposes; for, though its minute blossoms are fascinatingly pretty when closely examined, they are not at all showy in form or color, and apart from its undeniable grace, the plant has few qualities to recommend it to favor. But, in connection with more highly-colored favorities, its mellow russet, wrought of tiny specks of brightest hues, gives the effect of Persian fabric toning and blending to a rich and pleasant harmony, the sometimes startling contrasts of the garden.

The Humea is propagated by seed. This should be sown in a moderate hot-bed in the spring; then pot off or plant in the border until cold weather, when the plant must be removed to the greenhouse, to await its final setting out in the garden bed during the spring of the second season, for as it is a biennial, it will not mature the first season. If the plant is grown in a pot the first season, it will be well to repot it several times, at each time using a pot a size larger. This will so greatly increase its strength and vigor as to amply repay the additional labor. To keep up a succession, it will be necessary to start a new supply from seed every spring.

The Humea is a native of New South Wales, Australia. In such situations as those mentioned no more desirable subject can be planted.

El Dorado, Cal.

Hygienic Information.

CHRONIC RHEUMATISM.

M. Veldhuis, Allegan Co., Mich., asks whether there is any specific cure for rheumatism. His father, who has been afflicted with the ailment for two or three years, has tried the nostrums of several doctors and quacks in vain, and he inquires whether the RURAL can give some good remedy.

ANSWER BY DR. GOODENOUGH.

There is no specific remedy for acute or chronic rheumatism, nor can there well be until something more definite is known about the cause and nature of the pains which are attributed to this disease. The term rheumatism has a very vague meaning, being applied to affections of the joints and muscles, with their tendons and fasceæ, or coverings, and which are due either to a chill or to causes which, with our present knowledge, cannot be ascertained, and which therefore are generally assumed to be atmospheric. In fact, all pains that do not admit of being defined, are called rheumatic. Formerly neuralgia, catarrh, gout and several other maladies, now considered distinct diseases, were included under the term rheumatism; but when, within the last century, the progress of medical science revealed the nature and specific treatment of these, they ceased at once to be included in the number of ailments which our present ignorance confound under this general designation; for there is little doubt but that the future will show that there are still included under this name various diseases profoundly unlike each other, and of radically different natures.

Various remedies have been tried with various degrees of success in the treatment of this malady. The prescription, however, which has proved highly beneficial or even curative in one case, has often been of little or no value in another. Many of these so-called remedies are empirical—merely experimental—in each individual case. They may succeed, or they may fail, but as they are harmless in any case, and as no certain remedy exists so far as we at present know, the chance of a cure should beget a willingness to give them a trial. A few of those which according to personal experience and the indorsement of the best medical authorities, are generally the most efficacious, are the following: Lemon juice taken liberally, which is generally of service in acute articular rheumatism, is also often beneficial in the chronic form of the disease.

Colchicum, iodide of potassium, bicarbonate, acetate, tartrate, and citrate of soda and several other alkalies as well as diuretics have also been found beneficial; but as the quantity of these to be administered and the length of time they should be given must depend in each case on special circumstances, it would be useless certainly, and might be hurtful to give a prescription here. Poor and hard-working people are the chief victims of chronic rheumatism, and nourishing, strengthening diet has proved highly beneficial in these cases. Cod-liver oil, as well as preparations of iron and quinine, would generally be found as curative as any form of medicine. For local applications:—Paint the affected joints with iodine; rub them with alcohol, ammoniacal or camphorated liniments, with opodeldoc or turpentine. Warm baths are excellent, general or local, especially the former. The water may be tinctured with mustard or other irritants in either case. Lately in Germany, very favorable results have been obtained by mixing muck or peat with the warm water; and this is very highly recommended.

Chronic rheumatism lasts often for months or years or a life-time and is always apt to return in an aggravated form. Even in the most satisfactory cases, it nearly invariably terminates in an imperfect recovery—imperfect either because it does not extend to all the affected joints, or because the process of repair is arrested at a particular point, and in all a certain amount of thickness and stiffness permanently remains.

The Querist.

ANSWERS TO CORRESPONDENTS.

Peppermint, Spearmint and Bergamot.

C. S., Swan, Noble Co., Ind., having a piece of black land is thinking of planting it in peppermint, spearmint and bergamot, and asks: 1, what would be the proper soil and culture. 2, the kind and probable cost of apparatus for distilling the oil. 3, the product per acre. 4, the names of any manufactories of the article in northern Indiana or southern Michigan. 5, do the United States export or import such oils. 6, are there any books published on the subject.

ANS.—The bergamot tree is a native of the south of Europe, and is particularly abundant near Nice and in the neighborhood of Reggio in Calabria, whence the entire supply of bergamot oil is drawn. The tree is small and produces a round fruit like a small orange, the rind of which yields the oil by distillation. It is not cultivated in this country and could not be grown in Indiana. Spearmint, the ordinary mint of our gardens, is generally grown only for culinary purposes, but when cultivated for the purpose of extracting the oil, the culture and distillation are the same as those for peppermint.

Peppermint is largely cultivated for the production of the oil of peppermint, a culture which was at one time confined exclusively, in this country, to Massachusetts, the western part of New York and some countries in Ohio, but was later taken up by the farmers in southwestern Michigan where for some years between 2000 and 3000 acres have been devoted to its culture. At present St. Joseph County, Michigan, and Wayne County, N. Y., have the reputation of cultivating it most extensively and profitably. Peppermint has a perrenial root and an annual herbaceous stem. It requires a good soil, deep and friable, such as a rich alluvial or good loamy soil, free from grubs and wire-worms. The land should be thoroughly pulverized by frequent plowings, harrowings, and rollings. According to the English method, the field should be laid out in lands or stretches about ten feet wide, upon which the young plants are to be set. The plant is propagated by means of offsets from old fields, and as soon as they appear strong above the ground, usually in May, they are taken from the old roots and set in the prepared soil at intervals of from four to eight inches. This is generally done by boys, some bringing the sets from the old plantation, others planting them with short wooden dibbles. In this country the land is usually laid off in furrows 15 to 24 inches apart, and sets or parts of old plants, are planted thickly in the rows.

To obtain a fine crop, it is necessary to keep the hoe constantly at work, as freedom from weeds is essential to a good crop, and since the land must be very rich, the abundant weeds, unless properly attended to, will seriously injure the young plants. The volatile oil is most abundant at the period of inflorescence and the crop should therefore be cut when in full flower, usually from August to October. For this purpose bright sunshiny weather, with little or no rain, should be selected. The operation is performed with a cradle having two fingers and the mint is raked into cocks where it remains 12 hours to wilt before it is distilled. The first year's crop is generally considered the best, not only because the plants are young and vigorous, but the mint is then free from a weed which is apt to spring up later. This weed is called mare's-tail fire-weed, and by several other names, resembles lettuce somewhat, and yields a volatile oil, bitter and pungent, which injures the product, if mixed with it. The second and third years the crop is much less; the fourth year the field is plowed and the crop springs up from the broken roots; the yield of the fifth year is about equal to that of the second, and after this the field is devoted to other uses. In England however it does not yield a full crop until the third year.

The still is a wooden vat of heavy staves hooped with iron, four and a half feet high, and six feet in diameter. The wilted mint is packed into it by treading it close with the feet until the vat is full when the lid is fastened down steam-tight. A pipe enters the lower part of the vat to convey steam from a boiler, and another from the top of the vat connects with a "worm" as in an ordinary still. On the admission of the steam the oil from the mint is volatilized, and its vapor, mixed with steam, is condensed in the worm. The mixed oil and water are collected in a receiver or separator. This is usually a deep and narrow vessel having a siphon-shaped spout joined to it near the bottom. In it the oil, owing to its lighter specific gravity, floats on the top and is from time to time removed, while the water runs out at the bent spout. The stalks, leaves, and refuse of the still, being useless as cattle food, should be converted into manure and returned to the land. The oil is packed in tin cans holding 20 pounds each and a large share of the product is exported. The cost of the apparatus for distilling will depend upon its size, finish etc., and can be ascertained from any manufacturer of distilling apparatus.

3. The quantity of oil obtained per acre is very variable, as a dry and hot summer is requisite in order to secure a full amount. Rain is very injurious when the plants are approaching maturity, making them too succulent, so that they occupy a much longer time in distillation and yield very little spirit. In common practice in England, the produce varies from ten to twenty pounds of oil to the acre, the plants yielding, in favorable seasons, from four to six ounces per cwt.

Good land, good hoeing and good manuring are necessary and then the plant may after all turn rusty. From the heavy expenses incurred in the labor requisite to render the plants strong and valuable, in the purchase and application of manures, and in fitting up the necessary apparatus and carrying on the operations of the distillery, as well as on account of the skill and attention which are continually required, the cultivation of peppermint can hardly be profitable, except as a specialty, and should never be undertaken without personal acquaintance with the methods and processes, for these can be only imperfectly learnt from books or papers.

4. We don't know the names of any in that part of the country. 5. The United States export peppermint oil and import bergamot, and probably spearmint. 6. We do not know of any books specially devoted to this subject, but it is incidentally referred to in several standard agricultural works.

Effect of Colored Light on Plants.

F. G. F., Roxborough, N. C., asks 1. for an explanation of the effects upon flowers, of light passing through glass of various colors: 2, how to start Dahlias so as to insure success.

ANS. — To assimilate materials of growth, plants are dependent upon the influence of light. When once assimilated they are not altogether so dependent. All the parts of green-leaved plants which are underground or otherwise excluded from light, are nourished *by the products of assimilation produced in the light; so also parasites destitute of chlorophyll live on the work performed by plants that contain chlorophyll, and are therefore dependent indirectly on light, even though the whole of their development may be completed in darkness, as in the truffle. In other cases they only emerge to unfold in the air the flowers already formed under ground and disseminate their seeds as in Monotropa (Indian Pipe.) Many plants which do contain chlorophyll and which live on inorganic food, complete their growth in entire darkness, putting forth their green leaves only at certain times for the purpose of again accumulating beneath the ground fresh formative material. Such is the case with the Autumn Crocus, Tulip, Crown Imperial, etc., and with such as form tubers and rhizomas. Now, ordinary light is made up of a number of different colors, which is shown by decomposing it through the medium of the spectrum and the rays of different refrangibility affect vegetation quite differently. Certain functions are induced only by the strongly refrangible, others only, or chiefly by those of less refrangibility.

The growth of plants depends upon their power of decomposing carbonic acid gas, i. e. their power of appropriating (assimilating) carbon. PFEFFER has deduced the following values for the decomposing power of the different regions of the spectrum, the action of white light being placed at 100.

For Red—orange	32.1
Yellow	46.1
Green	15.0
Blue—Violet	7.6

The effect, therefore, of "various colored glass upon different flowers" may be inferred by our friend. There is no light for plants like white light or God would have provided it.

2. Dahlias are propagated by seeds, roots and cuttings. The best way to "start" Dahlias is to place the tubers in gentle heat. Covering them with mellow soil in a warm place and covering at night will answer. In this way buds will soon start and the tubers may be planted when desired.

*Sachs' Text Book, p. 660.

Barreling Apples.

F. C. Denton, Botetourt Co., Va., asks what style of barrels is principally used by Western New Yorkers for shipping apples; is there a machine for cutting the staves or are they sawed; cannot they be put up at a cost of from 20 to 25 cents in a country where wood is plentiful; what is the best way to press apples in the barrel for shipping.

ANS.—Apples are mostly shipped in barrels made of staves which are cut with a knife. The blocks of elm or oak are steamed and a single stroke of a stout broad knife makes a stave. They are seasoned and then the edges trimmed by machinery. The heads are sawed. They can be made for about the price here suggested. For shipping, apples are heaped up about two or three inches above where the head goes in. Hardware dealers sell an iron screw-press for the purpose of forcing the head down to its place. A cheap lever can be made, but it is not so handy as the screw.

An Ailing Dog.

N. C. Williams, Madison Co., O., asks how he should treat his dog: it took a severe cold about two weeks ago; when out, it discharges any number of worms; the skin has turned very yellow and so have the eyes; the animal refuses to eat, but does not appear to be in misery.

ANS. — Make ten grains of santonin, eight grains of cowhage into four pills by adding a sufficient quantity of soap and syrup of buckthorn. Give one in the morning and one in the evening for two days. If it should prove beneficial, repeat ending with four tablespoonfuls of castor-oil. Give in the middle of the day twenty grains of root Turkey rhubarb. Let his food consist exclusively of rice, boiled in meat-broth of the consistency of thick soup. Feed of this always in small quantities while yet he is inclined to eat—if eat he will at all. Take him into a warm room and wash thoroughly with Castile soap and rub until dry. We think you will lose the dog.

Cow Yielding Thick Milk.

A. C. Mathews, Port Dover, Ont., has a cow that gives thick milk; commencing in one teat it continues there for one or two milkings, then shifts to the next and so on all round. Then there will be no cause of complaint for about a week; the more milk the animal yields, the worse the trouble is; and a remedy is sought.

ANSWER BY DOCTOR SALMON.

Changes of this nature in the milk may be caused by animals eating musty food or that covered with vegetable growths, or by drinking impure water containing cryptogams, by congestions of the udder and even by diseases of the digestive organs, according to Haubner. In this case it would seem to be due to congestion of a rheumatic nature. If the cow is stabled, see that the stable is dry and well ventilated, keep her from impure water or musty food. As medical treatment: give colchicum, one drachm, and chlorate of potassa two drachms, twice a day; if there is no improvement in ten days, bisulphite of soda in two drachm doses, night and morning, may prove beneficial.

Miscellaneous.

L. M. Brown, Onondago Co., N. Y., sends plant for name.

ANS.—It is Pulmonaria (Lungwort)—species probably officinalis. The specimen was much dried and broken.

S. S. Demarest, Bergen Co., N. J., asks whether there are any white wild swans in this country, and where white turkeys can be found in quantities.

ANS.—Large numbers of white swans frequent Currituck Sound, N. C. We do not know about white turkeys; can any RURAL reader answer?

N. W. Boddie, Nash Co., N. C., sends a twig and inquires the name of the tree to which it belonged.

ANS.—Cunninghamia Sinensis, the Chinese Cunninghamia—thus named after Mr. James Cunningham;—Pinus lanceolata (the Lance-leaved Pine) and Araucaria lanceolata, derived from Araucanos a people of Chili.

A Six-year Reader, Bellsville Md.—Having for some time been vainly seeking for some bronze turkeys with a view to purchasing them, asks why those having them for sale don't let the public know by advertising.

ANS.—This conundrum we pass. Let those having such birds for sale answer, preferably in our advertising columns.

L. S., Washington, D. C., wishes to know what the plant is of which he sends "root, leaf and stem" and "all about it."

ANS.—This is the False Soloman's Seal belonging to the Lily family—Smilacina racemosa. stem about two feet high, slender, curved as if from the weight of the ovate-acuminate, sub-sessile leaves which number about ten, three-quarters of an inch apart. The peduncle starts from the base of the topmost leaf, slender and ten inches long to the bottom of the slightly compound racemes of minute white flowers. The raceme is about one and a half inch long; the individual flowers not larger than the head of a big pin. Root, a rhizome, whitish-brown. Blooms here about June 10 usually.

C. N. Rich, Mooksville, N. C., says: please send price list of the best threshing machines in your State, with a six-horse power; also catalogues of the best agricultural warehouse in your city.

ANS.—Our advertising columns are well filled with the names of representative agricultural implement makers of the country: you should consult them. Write to JAS. BRAYLEY, Buffalo; M. WILLIAMS & Co., St. Johnsville; G. WESTINGHOUSE & Co., Schenectady; M. HARDER, Cobleskill; WHEELER & MELLICK Co., Albany, N. Y., & A. W. GRAY'S SONS, Middletown Springs, Vt., for threshers and horse-powers, as also to other firms in our advertising columns. Catalogues will be mailed you. R. H. ALLEN & Co., N. Y. city, is one of the largest and best general Agricultural Warehouses in the city.

St. Vrain, Longmont, Col., wishes to learn by whom the following books are published. 1. House and Home Papers. By Miss BEECHER and Mrs. STOWE. 2. The Schoolmaster's Trunk, by Mrs. ABBY MORTON DIAZ. 3. Gray's Botany.

ANS.—1. Roberts Bros., Boston; 2. Houghton, Osgood & Co., Boston; 3. Ivison, Blakeman, Taylor & Co., New York.

NOTES FROM EASTERN SHORE OF MARYLAND.

CAROLINE CO, Md., May 15, 1878.

OUT-DOOR operations being temperarily suspended by rain which has been steadily falling since yesterday noon, leisure is thereby afforded me to engage in a brief "pencil chat" with the RURAL. During the past winter months we had considerable spring weather; now, it seems as though we were behind someway in our weather accounts, and in order to fill out the time allotted to spring, are compelled to use some of the winter days, thrown aside too soon. Notwithstanding partially cloudy weather on the night of 13th inst., the following morning found considerable frost in places; not, however, sufficient to do much harm. Crops are not looking as well here this season as last; wheat on light soils is noticeably poor in comparison with last year; but then farmers agree that the wheat crop of 1877 was superior to that of any other within their recollection; hence there will be no just reason to despair if the present crop falls short of this exceptionally good one.

The decline in price of commercial manures within the last three or four years is telling with marked effect upon the agricultural interests of the "Eastern Shore;" and it is to the Order of Patrons of Husbandry that the farmers are mainly indebted for this revolution in their favor. Co-operation works wonders in agricultural as well as other pursuits. A couple of dozen farmers combining, in each district, purchasing materials at wholesale prices, and manufacturing their own fertilizers, have been the means of saving thousands of dollars to the horny-handed tillers of the soil. And really when present costs of commercial manures are compared with those of a few years ago, it is scarcely discernible how the average farmer made both ends meet, as but comparatively little stable manure is made here. In fact, a few of our most thrifty farmers say it is cheaper to use good phosphates at a fair price, than barn-yard manure gratis, reckoning cost of labor in handling, return in crops, etc. The reader is not to suppose, however, that this opinion extends to any great number of our farmers, for the prevailing belief as to permanent improvement of the farm, rests upon the immutable basis of barn-yard and stable manure. True, the amount of labor involved in preparing, hauling, spreading, etc., of barn-yard manure, on a well-stocked farm of 200 or 300 acres, is no trifling item in the expense account; and where there is a lack of brain capital to draw upon in the administration of this part of the farm government, it is possible that artificial manures would be the cheaper of the two, as there is no doubt but that a great deal of barn-yard manure is produced at too high a cost. It is the practice here to use all the stable manure on the corn crop, spreading it on the land during the winter and early spring; then for wheat there is nothing to depend on but artificial manures, from 200 to 300 lbs. of a good article being the usual quantity applied to the acre.

J. W. KERR.

RURAL SPECIAL REPORTS.

SWAN, Noble Co., Ind., May 16.

WE have had a beautiful spring fully four weeks earlier than common, but the weather has been so very wet that farmers are just planting the first installment of corn. Fruit trees bloomed very full, but wet weather blasted a great many of the blows; still we hope for a good crop of apples and peaches. Jack Frost or rather Jack Freeze—for the thermometer was two degrees below freezing point—visited us so severely on the mornings of eleventh, thirteenth, and fifteenth as to completely kill grapes. They are as brown as after a November frost. I don't think it damaged wheat, though many feared it. Times are very dull; Kansas fever is raging fearfully now, and good farms can be bought cheap here. No demand for laborers; farmers have tired of selling all they raise and some stock to pay off hands.

C. S.

HARLAN Co., Neb., May 20.

WEATHER.—It has been often claimed that Nebraska soil was like a sponge storing moisture and holding it for a time of need. It has been thoroughly tested in this locality this season. We had an unprecedentedly heavy rain last December, and since then we have had no rain until May 12th and 15th. The ground has been

in fine condition for working all winter and spring thus far—mud a thing unknown; no wasted rainy days. Crops have not materially suffered and just as faith in Nebraska weather begins to wane and farmers are reporting "Crops not injured yet but soon will be," the rain falls gently, soaking to the bottom of the furrows. Save a few counties in southwestern Nebraska and northwestern Kansas showers have been frequent. R. H. CRANE.

NEWPORT, Orleans Co., Vt., May 20, 1878.

THE frost has struck you harder than it has us on the line of 45° north. Corn 6 inches high in my garden, shows no sign of frost—indeed the only things I have seen to indicate temperature below 32° were some Trilliums in a deep narrow valley or ravine near my house. I am on the shore of Lake Memphremagog; up in the hills we hear of sharp freezes in some spots. Potatoes are up, and orchard-grass heading out. Prospects of a large apple crop for those who have orchards which are yet few, however, in this part of the State. But the researches of Pomologists are giving us fruits hardy enough to carry orcharding one or two hundred miles further into the northern cold than has before been thought possible. T. H. HOSKINS.

CARROL CO., Ky., May 17.

WHEAT, the all-absorbing theme of to-day, is holding its own against the rust; and is heading out finely, although in appearance at a few hundred yards distance it is quite ripe. What the effect will be the "oldest settlers" are unable to tell. Were it not for the rust we would set it down at 50 per cent. above an average at this date. Rains and fogs frequent, but the weather continues cool, so much so that corn is quite yellow and growing slowly, although we have an unusually good stand. Fine prospect for apples, cherries, strawberries, in short for all fruit except peaches. Pastures 50 per cent. above average; stock in splendid condition. S. E. H.

CARLTON, Kewaunee Co., Wis., May 17.

WE have had a very wet, cold spring. The grain looks poor, and in many places is drowned out. Last week we had three hard frosts which did considerable damage. There are now three cheese factories in operation in this county, and they are a benefit to the farmers. Cows are cheap. There is but little "blooded stock" in the county. Wages are low and laborers are plentiful. The following are the prices paid here: Wheat, $1.06; potatoes, 30c.; hay, $10; butter, 12c.; eggs, 7c.; cows, good common, $20; graded, $25@40. The factories pay 80 cents per hundred pounds for milk. J. A. WHITAKER.

WINDHAM, Portage Co., O., May 16.

WE have had rain here every day for 23 days, commencing Friday, April 19, ending Saturday May 11, and winding up with a slight fall of snow on the 10th, and three frosts on the nights of the 12th, 13th and 15th; that of last night being hard enough to form ice upon water. Early potatoes are killed. Some fear it has injured the fruit crop. No corn planted yet. Wheat is looking splendid. Good prospects for a heavy hay crop. Corn, 30c. per bushel; potatoes, no demand at 25c.; oats, 1c. per pound; butter, 12½@14c. per pound; eggs, 9c. per dozen. CLINTON HIGLEY.

OWENSBORO, Ky., May 14.

WE are having cool weather now—plenty of frost last night. The two weeks of May past have been cool and rainy. First planting of corn looks well; the crop about all planted. Tobacco plants scarce; wheat got the rust very badly on the blades, but the stalks, so far as I have observed, are healthy. A great deal of uneasiness is felt in regard to the crop. My short experience is that so long as the stalk is healthy the grain is not materially damaged by rust on the blades. In article on "Kitchen Garden," May 4, instead of "lay by" sweet potatoes etc. it should be Irish. J. W. S.

BROWN CO., Wis., May 15.

CROP PROSPECTS.—Wheat is generally looking well; some on high and dry locations remarkably so; some on low ground is beginning to look yellow; on the whole, it looks well and there is about double the usual acreage sown in the county. It has been pretty wet for oats, but they are not all done for and we shall probably have an average crop. Corn and potato planting has just begun. The winter was rather rough on winter rye, but where not winter-killed, it is doing well. VAN.

WHITNEY'S POINT, Broome Co., N. Y., May 20.

THE 11th and 12th cold and squally with now and then snow. Wind north-northwest; 13th, 14th and 15th, frost; fruit as yet uninjured; wind north-northwest. Thermometer averaging 80° at sunrise; raining to-day; wind south. Wheat very large; potatoes, 20c.; oats, 33c.; eggs, 9c. per dozen; butter, 15c. per pound. M. B. P.

REYNOLD'S, Rock Island Co., Ill., May 18.

ON the mornings of 13th and 14th every thing was white with frost. Nothing badly damaged however, except beans and tomatoes, as far as I have heard. C. H.

RURAL GROUNDS, May 25.

WEATHER cold at night—cloudy. Three-quarters of the Strawberry crop blighted by frost. Plenty of rain. Sunshine is needed and warmer nights to forward melons, etc.

WINNESHEIK, McPherson Co., Kans., May 14.

WE have corn, wheat, oats, pork and-so-forth, but can get no money for them; at least not more than enough to pay expenses and hardly that. E. A. E.

WHAT THEY SAY OF IT.

TWELFTH WEEK.

The Rural Cricket to be Withdrawn, positively, the 1st of July.

The most Liberal and Valuable Present ever offered by any Journal.

ALL ARE PLEASED AND THE RURAL IS HAPPY!

THE clock reached me this week; and I thought myself sadly sold when I could not set it going; but I soon found I had wound it too tight. It now works charmingly, and I cannot say enough in its favor. M. B. C.
Lisle, Broom Co., N. Y., May 3, 1878.

THE "Cricket" was received in good condition, but it gains time rapidly. I will take it to some reliable person and have no doubt but that the trouble can be remedied. My thanks for the clock. S. M. H.
Bath, Pa., April 26th, 1878.

THE "Cricket" came to hand just one week ago to-day. We are indeed much pleased with it. We find it all that you represented it to be, and think it by far the most useful premium ever offer by a paper. G. M. S.
Duluth, Minn., May 18, 1878.

THE clock came safely to hand yesterday morning, and it is a real beauty. I am much pleased with it. I have wound it up and it has been ticking away like a good fellow. I believe it will keep good time. Please accept thanks for it.
Shrewsbury, York Co., Pa., May 14, '78. J. M. L.

THE little "Cricket" reached me safely. I am more than pleased. I am just delighted with it. I thank you very much for this special favor. I shall not cease my friendly efforts in securing subscribers whenever an opportunity offers. MARIA H.
Grand Rapids, Mich., April 30th, '78.

AN apology is due for neglect in acknowledging the receipt of the RURAL "Cricket" sent to our address, April 1st. 'Twas an agreeable surprise and is thus far appreciated. We shall not be able very soon to supply its place with a more desirable gift, and for it please accept our thanks. MR. & MRS. E. G. S.
East Randolph, April 30th, 1878.

THE "Cricket" you sent me arrived on time, all safe. I wound it up and set it up by the side of our old "Seth Thomas" and it ran right away from the old fogy; gained an hour in 24. I have had quite a time in getting the lad "toned" down, but it is all right now, and runs exactly with old "Seth." The accompanying order for another is the result of the affair.
Lansing, Mich., May 1, '78. O. W. C. B.

THE "Cricket" was received in due time safe and sound, and I return you sincere thanks. I have received many valuable premiums from the RURAL, and each has been worth more than the "Cricket," yet I was never more pleased with any than I was to receive this, and, as all premiums have been just as represented, I have no doubts concerning the "Cricket." H. J. S.
Carlisle, N. Y., May 6, 1878.

THE RURAL "Cricket" arrived here safely the 30th ult., and I am very much pleased with it. It is just what it is represented to be—an accurate time-piece, and a very pretty ornament. It is the most noisy cricket I have ever heard, and in it our old family clock will have a very formidable rival. Many good wishes for the RURAL NEW-YORKER. E. L. C.
Skaneateles, N. Y., May 3, 1878.

THE "Cricket" came all safe. It exceeds our expectations. We purchased one last autumn for our daughter who needed a clock in her school-room, for three dollars. We were delighted with that, but we would not exchange the "Cricket" for it. We return many thanks for it; also for the package of flower seeds received from you last winter. I hope to be able to offer flower seeds to the readers of the RURAL another year. We have never taken a paper that gave us the pleasure we receive from the RURAL. We read it thoroughly and then mail it to our sons who are hoping soon to be able to subscribe for it. MRS. F. E. F.
Lawrence, Kansas, April 25, '78.

THE

RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JUNE 1, 1878.

AN UNWISE EXPORTATION.

We learn from our foreign exchanges that a new experiment is being tried in the importation of lean cattle from the United States to be fed on the rich pastures from Schleswig-Holstein. The steamer Schleswig is mentioned as having brought 322 cattle, 15 horses and 46 swine from New York. They are highly commended, as "well-grown, strongly built," and ready to make good progress on proper feeding. "The pigs were well and active, well-fed, etc." They are submitted to a rigorous quarantine of two weeks.

We chronicle this as news, but with the purpose of deprecating such enterprise on our part, as resulting in wasting our resources instead of making the most of them. The most expensive part of the production of beef is in raising these lean animals for the final feeding period. They can hardly be sold at a remunerative figure at that stage, and it cannot be wise for our stock farmers to sell such expensive unfinished animals when a few months would complete their fattening for a better market. The cost of transportation is even more per hundred weight than for well-fattened animals, because the lean ones occupy more space proportionally. It cannot be national thrift to send these unfinished animals from our country of cheap food to be fattened on much dearer food. The profit must be made on the finished animal. It is true that this may not be quite so bad as exporting our cattle foods to be used in growing foreign beeves, but it is the same policy as far as it goes. We can grow beef, pork, and mutton cheaper than any other country, save perhaps Australia, and it behooves us to study the transportation problem, and to export only the most concentrated product. The last 200 or 300 pounds put on a steer draws a much larger compensation than any other like amount. As a stocker of 1,100 or 1,200 pounds it is worth, say, in our present market, 3½ cents or $42, but as a well-fattened 1,500 pound bullock it is worth 5½ cents, or $82.50, so the last 300 lbs. nearly doubles the value of the animal.

This illustrates the importance of the finishing process, and shows the folly of exporting lean cattle to Europe to be fattened. The time has come when American agriculturists should study every branch of their business that they may reap their just reward. We are glad to find that every year sees less corn, proportionally to our production, exported and more meat, and trust that this will go on till we shall export little grain, except that used for human food.

IOWA.

According to the remarks of Mr. Shaffer, the Secretary of the Iowa State Agricultural Society, 1877 was a sad year for that State, although the Report does not very well sustain it. He says: "There never has been a time in the history of the State when there was so great a depression of business of all kinds" as at the date of the report (January last). This was owing, in part, to "incessant rains and impassable roads" which laid an embargo on all sorts of trade. The curious spectacle was presented of an inter-state railroad suspending its freight-trains because no products could be hauled to depots. Corn rotted by thousands of acres in the field and thousands of bushels in the crib. Wood, so largely used for fuel throughout the State, could not be taken from the forests where cut, so that prices were higher than for years before. Those who depended upon hogs and cattle and corn to meet obligations in bank, saw only failure staring them in the face. No new manufacturing enterprises were inaugurated, and those already in operation were curtailed as far as possible. The erection of new buildings and the progress of such improvements did not supply half of the skilled laborers with work, who sought it at nominal figures.

From this report the rapid progress of corn-growing is shown. In 1863 the area planted was 1,733,503 acres, yielding 63,883,911 bushels, an average of nearly thirty-seven bushels per acre. In 1875 there were 4,019,738 acres, yielding 146,993,570 bushels. Assuming the same ratio of increase as that in previous years, there must have been 5,063,685 acres in cultivation last year. The fact is pointed to that over 5,000,000 cans of corn were packed in the State of Maine, giving a revenue of about $1,000,000, and furnishing employment to nearly ten thousand persons during the packing season, and the suggestion is offered that an inviting field for the capitalists of Iowa might exist if this "tide of export" were checked and home manufacture established.

The report estimates that the State had a surplus of 30,040,000 bushels of wheat for shipment after allowing for increase of population, or ten bushels to each person. This would give a revenue of $26,285,000 at the average price of the crop in the State, eighty-seven and a-half cents per bushel. Such figures ought surely to be gratifying, as at least illustrating the capacity of the "virgin soil" of Iowa to produce this prime element in the food product of the world. The report here utters a word of caution. "How long can this wonderful production be continued?" "Must not there be fertilization?" Or in a few years "will not the wheat area be removed from Iowa as it has been from States farther east?"

Iowa ranks fifth in the number of milch cows. There were 665,300. The product in butter and milk, it was thought, would not fall short of $30,000,000, or nearly $20 to each inhabitant. The large infusion of good blood from the Jerseys and Short-Horns and the general improvement of cattle on the farm, have doubtless tended largely to an increase not only in the product but in the interest everywhere manifested in matters pertaining to the dairy.

The report deems that not enough regard is paid to the grass crops: "They are worth more than the corn and wheat and all the fruits put together; that is, they represent a greater money value, and there is no year when this has not been a fact, and such a year may never come. All waste places can be utilized and by judicious management can be made to yield a large return for every dollar expended in fencing, draining and planting trees for shade and protection."

While the present price of hogs is so low as to be discouraging, the report takes for granted that good hogs always bring a fair price—"while for breeds of indifferent blood there is no sale at all." Iowa, as a hog-producing State, exceeds any other in the Union by 513,200. The abatement of hog diseases, so prevalent in former years, is thought to be due to a more "thorough system of care and protection from the storms of winter and the heat of summer." After mentioning some startling figures, showing the annual loss by diseases of hogs, the report says: "The State of Iowa should expend some money in the investigation of the diseases of animals generally, and of swine especially. All that is published as to the cause, is a tissue of absurdities. All substances that are prescribed as remedies are empirical and often nonsensical. What Iowa wants is an appropriation sufficient to buy the intelligence and skill and worth of some man, or set of men, who will find out the fountain and origin of these diseases, and thus suggest a remedy, and save the State from losses that annually reach up into the millions of dollars."

The remarks respecting sheep are especially interesting and instructive.

The number of sheep in Iowa in 1867 was			1,593,226
"	"	1875 "	724,204
"	"	1877 "	318,439

This shows a loss of one million, two hundred and seventy-nine thousand, seven hundred and eighty-seven in ten years. The cause of this decrease is attributed first of all to dogs. In the matter of dogs legislation seems to have failed in Iowa as elsewhere. The sentiments, "Love me, love my dog," and "Every family should have a dog," have perpetuated and increased the number of dogs and steadily diminished the number of sheep. The remedy suggested in the Report is to "educate the public to believe that a sheep is better than a dog, and that it does not cost so much to keep the former as the latter. Some of the loss is attributed to wolves; and some to inexperience.

The quality of oats was better than for several years, and the crop larger. Two hundred thousand acres of barley were raised, with an average yield of twenty-six bushels. With such a commingling of success and failure, there was no "lack of food." There was no one hungry of necessity. "None suffered from lack of clothing and shelter except the negligent and the imprudent."

We trust that this season may fulfill the prediction of the Report that "From this dark (?) outlook all may confidently expect that light will break forth, and prosperity once more gladden all hearts."

THE SMOKER'S CAR.

Reader, have you ever, either by accident or design, been in the smoking-car of a railroad train well under way? If not, we beg of you to improve the first opportunity to do so. It will enable you to see life in a new phase, and you may possibly learn a lesson from it.

We think we are safe in saying there is no life, either animal or vegetable, less tenacious than that of man, which could continue long within its smoky precincts. Thirty, forty, and sometimes as many as fifty pipes and cigars of all kinds and conditions, in full blast, are giving off their clouds of poisonous smoke, which fills the entire capacity of the car.

Fumigation so thorough would soon clear an infested ship of rats and other vermin. Plants subjected to its influence would be poisoned to death in a short time. A child would be soon suffocated, and strong men, who have not been accustomed to such an atmosphere, would succumb to its poisonous influence.

The human physical organization is of wonderful endurance. We have only to notice the vast amount of poisons, administered by medical advisers in their daily practice, which the system rejects, always with more or less injury, to be convinced of that fact. Without going to extremes for illustrations, we see how tea, coffee, pepper, spices, and other things not natural to man's appetite, or beneficial to his system are, after constant and moderate use, not only received by the system without opposition, but finally a hunger is induced which they alone can satisfy, or which at least it is difficult to overcome. The same may be said of the use of spirituous liquors, arsenic, tobacco in its various forms, opium, and many other forms of poisons. Perhaps man was so constituted, expressly to enable him to withstand the poisonous atmosphere of the smoking-car.

The smoking-car may be taken as an illustration of man's moral as well as his physical nature and tendencies. If the doctrine of total depravity, as once taught, was true, we might suppose ourselves born in a spiritual smoking-car, whose cloudy contents were in exact consonance with our unholy condition, and amid which we should revel with the highest enjoyment.

But in these days of more liberal views, we are taught that men are only naturally inclined to evil ways, and readily believe that in our individual cases the inclination is so very little from the perpendicular that there is no danger of a fall. Our neighbor, who indulges in a whole pipefull of sin, may be in danger, but our little cigarette can work no harm. In fact, we see no reason why we should not be allowed to smoke it if we choose.

The little sins are but blossoms of which the larger ones are the fruit, and the season of growth is sometimes exceedingly short. One wrong thought or action is followed by another as readily and inevitably as is the cigarette by the cigar.

The confirmed sot had his first glass of wine, and he who stands lowest in the moral scale, his first departure from the paths of righteousness.

We are all journeying on Life's Railway, and on each train there is a smoking-car. Those who enter it do so from choice. They may be urged or influenced by others, but the decision, the *yes* or the *no*, is with them. More or less of the dust of the road will be found on each one of us. We shall not run into the terminal station with our apparel fresh and clean, let us do the best we may; but we can show that we have striven to avoid contamination, and that we have at least kept clear of the abominations of the smoking-car.

The Frost.—The frost, to which we referred last week, perpetrated more harm in the Rural Ground than we were aware of. The new shoots of many balsams and spruces were killed, the effect of which will be more apparent later in the season in the disfigurement of the trees. Many grape-vines were killed. We had supposed that only the new and tender shoots were harmed. But the early buds and growth seem to possess much of the vitality of the plant, so that when frozen, the entire plant receives a check—a shock from which it cannot recover. Had these same shoots been *rubbed* off, we doubt not, though weakened, the plants would have pushed other buds and survived. A greater proportion of seedlings than of others was killed—for the reason, we presume, that the new growth as compared with the old wood was greater than in older vines.

Comparing such vines as Rogers' No. 1 (Goethe) with the Concord, it was plain that the latter had sustained the greater injury, though the hardier variety of the two. But the Concord had made twice as much growth. The panicles of buds in the Concord were all killed. Half of those of the other escaped. For this locality—as for any other visited by severe frosts—there is a "marked difference" in the reward likely to be offered to the "Early Bird" and to the "Early Spring."

It is Different.—There is no accounting for tastes. Some people don't like the looks of trees that are whitewashed. Some people admire the contrast between the white stems of the Cut-leaved Weeping Birch or of our White Birch and its green leaves, or the deep purple leaves of the Blood Birch, a variety of the European White Birch. But if we should take our common Black or Sweet Birch and whitewash the stems occasionally, would not the contrast be as fine!

Cheap Ice-Houses.—Bore two or three holes in a hogshead and cover with a wire netting. Then place a layer of saw-dust. Fill in with ice and the spaces with saw-dust. One hundred pounds of ice may thus be made to keep for a week, and this is sufficient to supply a small family. Ice is at present delivered to country homes by butchers and others at forty cents per hundred. For those who have neither refrigerators nor ice-houses, what is the objection to this method?

BREVITIES.

To keep up a uniform flow of milk the year round, feed cows a couple of quarts each per day of meal, adding shorts in winter.

In sowing grass seed sow a variety and sow a plenty of it. As a rule we do not sow seed enough; and this year, when it is very cheap, it is a good time to sow more.

We do not believe the country—take it anywhere and everywhere ever looked finer or gave a better promise of splendid crops of all sorts than at the present time. "But there is many a slip," etc.

We caught a sparrow in the act of eating our first ripe strawberries. The sparrows are not to be blamed for liking strawberries better than caterpillars—only they ought to have some respect to the conditions of the hospitalities extended to them by this country.

C. L. Flint of Massachusetts says that every farmer knows that he is by no means sure of "getting a catch" when he sows his grass seed with oats, or even with wheat or barley; and there is pretty good evidence that, if we are going to raise wheat on a piece of land this year and grass next year, we shall do better by sowing the wheat alone, and after it is cut turning over the stubble and sowing our grass seed in the fall or early next spring. This plan may require a little work, but it will give more hay.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

LIFE'S REST.

J. L. L.

You lean from your casement small
And look with longing eyes
To the hills beyond, nor see
The beauty that nearer lies.

And you sigh in discontent
That your life is narrow and small;
Do you not know, little maid,
That your narrow life holds all

That can make it sweet and true—
That can make it fair and blest?
Of all the world's good gifts
You have the very best.

Out at work in the fields,
Husking the yellow corn,
Is a man whose honest heart
Beats for you night and morn.

Were you to search the world,
What would you hope to find
Better for heart or hand
Than this you would leave behind?

Ah! little girl, the hills
May glow with a splendid grace,
But the valley, after all,
Is a very pleasant place.

And nothing that life can give,
Be it ever so great and sweet,
Could be one-half so grand
As this love beneath your feet.

Though the hills seem glory-crowned,
Yet the hills are bleak and drear;
But the valley is sheltered warm—
Stay in the valley, dear.

"BONNETS AND HATS."

THE peculiarity of the millinery this season is the "barbaric splendor" of its ornamentation. Bonnets, feathers and flowers are lavishly enriched with sprays and fringes of pearl, gold or silver beads. The pearls are in different colors—gold, rose, white and water-green and are in all sizes. Gold and silver beads are all small. On bonnets the pearls are disposed in rows about the under or upper side of the front and generally the upper side of the circumference around the back. Metallic beads are sometimes interposed between pearl rows. A row of pea pearls and two of seed pearls beautifully begem the stems of long, wide ostrich feathers. Ostrich feathers tipped with marabou, showered with gold, silver and pearl, are elegant novelties. Plumes of marabou alone

FIG. 1.

are sprinkled with all three decorative additions.

The taste in flowers is for heather, small oats, heliotrope, unripened grass seeds, tamarack foliage, white lilacs, strawberry blossoms, golden-rod bloom, blossoming mosses, poppies streaked with pink and yellow, dusty foliage, sere leaves, dried natural grasses, queenly roses in deep, lovely watermelon-pink. Large wreaths are composed of a liberal amount of foliage, a cluster of three or four roses, and five or ten buds, natural size. Buckles and pins seeded with pearls and set about with glowing steel facets, are very rich.

Soft silks and tissues of Indian texture in loose meshes are used as trimming. Some silken fabrics are woven in a half-diaphanous net, and brocaded with flower sprays of velvet. Ribbons are watered on one side and plain on the other. The most fashionable bonnets are of chip and fine straw. Some of them are composed of alternate silver and gold braid. To any lady who may desire, I will supply information as to prices of bonnets, feathers, flowers, etc.

DESCRIPTION OF CUTS.

Figure 1 is known as the "flower bonnet" of which there are a number of styles. This one is composed of buttercups and foliage, with an intermingling of pearl-tipped grasses. It is made over a lace or silk frame, and has illusion ties.

Fig. 2 This has a low coronet faced with velvet and piped with silk, while just above the piping is a row of fine beads strung on wire. The bonnet itself is chip and is neatly trimmed with satin ribbon, together with a cluster of blossoms set in front near the crown, no face trimming is required, a cluster of blossoms is caught in the bow.

Fig. 3. The walking hat here represented is fashionable for street wear, and may be trimmed as illustrated, or with a band, a flat bow at one side, a wing and binding. In the present instance a wreath of blossoms, wound with ribbon, encircles the crown. At one side of the front two guilt heron feathers are caught, and back of them is a rosettee bow of ribbon. Another bow is caught under the brim at the opposite side, to complete the hat. Black, brown or white straw or chip hats of this shape are equally sty-

FIG. 2.

lish, and may bo trimmed with contrasting colors.

Fig. 4. Is of fine Tuscany straw and in shape is simply a high crown curved out at the back and brimless. It therefore fits the head closely and requires no face trimming. A demi-wreath and a band of ribbon trim the center portion—a large rose with foliage commencing the wreath a little to the right side and fine flowers terminating it at the left side. A large cluster of standing loops is at the right side of the back, their ends fastening under the blossoms. The ties may be of narrow ribbon or lace.

FIG. 3.

Fig. 5. Illustrates a hat the front of which is a double coronet covered with shirred satin and divided by a wreath of blossoms and foliage. Its lower edge is bound with satin and underlaid with a rushing of lisse which sets closely to the hair. The crown is of chip and to it is caught a mass of blossoms, from which falls a long plume of fine grass with the ends tipped with pearl beads.

Fig. 6. A handsome promenade hat is here illustrated in dark straw with trimmings of satin, three demi-plumes and a cluster of silk cord. The face trimming at the side is composed of loops of satin confined by a couple of gilt and pearl ornaments. One of the three plumes falls backward and another forward, while the third also inclines toward the front. At Fig. 7 is presented another Roseberry. The side under the raised brim is filled with flowers, and the crown is encircled by a twist of velvet terminating in a jaunty bow at the front. This bow also confines the stem of the sweeping plume that extends over the crown and falls at the back.

Fig. 8 represents a straw hat made of fine braid. The trimming is simple, consisting of a band of satin formed into a square bow, with a knot at

FIG. 4.

the left side. From the top of this knot rises a short ostrich plume which curls over the crown in a very graceful manner. As the brim slightly rolls at the sides it is faced underneath with satin so as to present a neat finish. Velvet or silk may be used in place of satin, and the outside trimming a scarf of gauze or tissue, with a wing at the side.

Fig. 9 is a white chip hat. Velvet folds encircle the crown and opening, and tips surmount the crown at the front, and give quite an airy effect in spite of the density of the trimming fabric. The face trimming consists of a shirred band of velvet, overhung by a fall of bead fringe which continues across the back, where it is entwined with the velvet in a very effective manner. The ties are of satin gros-grain ribbon, at the front or back.

F. R.

WOMAN AND ILL HEALTH.

MRS. POTIPHAR.

Is chronic invalidism the normal condition of women? MICHELET and a whole host of lesser lights in the literary firmament have answered this query in the affirmative. In fact, men generally seem to accept as true, the statement of one of their number that "woman is born to a heritage of pain and weakness"—a perfectly healthy woman is to them an anomaly.

FIG. 5.

This tendency, on the part of the sterner sex to regard woman as by nature lacking in vigor, breaks out quite virulently where it is proposed to extend the sphere of her activities. Is the question of sending her to college discussed, or is it hinted that there are latent possibilities which, developed, might make her eminent as an artist or scientist? then do the brothers of the human family grow eloquent over the physical limitations of our sex; then do they draw appalling pictures of the consequences to posterity if the girls of this generation are permitted to exhaust their little strength in gathering ideas.

They shed tears over the pallor of girlish students; they collect statistics of the number of headaches per annum with which the average-scholar is affected, and then call on the community at large to put an end to this wanton waste of health and strength.

FIG. 6.

The physical weakness of woman is dwelt on at such length and is so elaborated, that for the time being the periodicals and the press of the day are transformed into physiological text books. It is claimed that this feebleness is such as forever to debar her from exhaustive intellectual effort, except at the expense of her own health and that of her prospective children.

Ordinarily, the physical well or ill being of woman does not call out any special comment or demonstration from men. For ages, pale-faced women have slaved and toiled far beyond their strength, for husband and children, and yet these gentlemen who wax lachrymose about the vitality expended by girls in the pursuit of knowledge, have calmly contemplated the spectacle of whole generations of wives and mothers sacrificed on the home altars of housekeeping and baby tending without so much as even hinting that the tendency of matrimony is to produce ill health in women. They never admit that the lot of most married women is to be commiserated. The wife, albeit she is weakened by the care of house and children, is always represented as occupying an enviable position. What tears these gentlemen have to shed are reserved for the ambitious girl student and for those women who prefer to walk through life alone rather than with uncongenial companions. Men are so partial in display of their sympathy that one is led to doubt both their conclusions and the genuineness of their pity.

That women, as a rule, are more inclined to invalidism than men cannot be denied; but were they born so?

Is it reasonable to suppose that a benign God would deliberately doom a creature to a life of weakness, or give her functions and a work to do and not supply the requisite strength? Is not this lack of vigor, rather the result of artificial habits of civilization? A well-known woman physician lately attributed three-quarters of all woman's invalidism to the present style of dress! Another woman, eminent as a writer, has pointed out that the most potent reasons for the universal

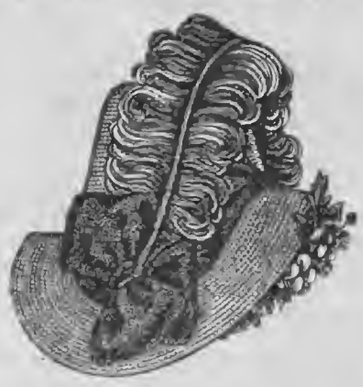

FIG. 7.

ill health among women are their lack of interest in intellectual pursuits, the over-stimulation of their emotional natures; their disinclination to out-door exercise and their slavish devotion to the needle and the sewing-machine.

It is a well authenticated fact that women who have not exceptional frames can, by training, equal and surpass men in the exploits of the gymnast and if in this most strength-taxing profession they can put themselves on an equality with man what is to prevent women lifting themselves out of their present pitiable feebleness by some system of judicious education, combining exercise and hygiene?

No one has sufficiently computed, it seems to me, the grand elasticity of womanhood. The good God has given her a brain as well as the sacred office of maternity. Not by spasmodic intellectual effort, with intervals of indolence and vague imaginings are the great mothers of the race to be reared and formed. The perfectly healthful woman whom the doctors never see will laugh, if you tell her she was created an intermittent invalid. She knows the sustaining force, the healthful reserve of power, which keeps the balance of her pulses under all the complex conditions of her life. Nature foreseeing the various demands upon her, has gifted her with powers of endurance, of rebound under care, of patient pulling and steering through shoals of harassing and complicated duties, be-

FIG. 8.

fore which the stoutest "stroke" of the university crew would break his oar in exasperation and lay himself down in despair.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

MRS. S. B.—I send samples of embroidery and lace by this mail.

MRS. MERTON, Venango Co., Pa.—Colored embroideries are used on underclothing, and the effect is quite pretty, although for myself I should prefer some of the laces now so much worn.

MISS LULU JOHNSON.—The Roseberry hat can be made "dressy" by tasteful trimming. A dark brown straw one, trimmed with seal-brown velvet, ecru mode silk and ostrich tips of same colors, is both stylish and pretty.

WANTED.—A recipe for staining wood.

L. M. BROWN, Onondaga Co., N. Y., asks some one to tell her how to make a pretty paper-receiver.

FIG. 9.

DAME DURDEN wants some "RURAL" mothers to tell her what indoor games she can amuse her little toddlers of three, five and seven years with.

MRS. HULBERT, CALIFORNIA.—Yard sample is seal brown and as good quality of silk can be purchased for $1.50 per yard. That is if you will be satisfied with American manufacure.

Literary Miscellany.

REPLY TO A CHILD'S LETTER.

Over the mountains far and blue
Bubble has sent me a tiny note,
The dearest, charmingest billet doux
That ever a little maiden wrote;
A scribble-scrabble of willful pen,
Like written cooing of a dove,
But in great letters round and plain
The dear words, "*Bubble sends her love!*"

The rest I could not understand,
'Twas baby Greek, for aught I know,
Or hieroglyphs from fairy land—
But nothing on the earth below,
And nothing the bright stars above,
Nor flower, nor gem, nor pearl in the sea
Is dearer than the gift of love
Little Bubble has sent to me,

Dear little maid with sunny hair,
Your random shaft has touched my heart
With happiness that, unaware,
Your grace and innocence impart.
God bless you! May your happy life,
Bright as the pet name they have given,
Float calmly free from care and strife,
Reflecting only hues of Heaven.

[*Phila. Evening Bulletin.*

CORA.

A few days passed miserably. From indifferent and cold, Sir Alan's manner became sharp and harsh; many were the sarcastic and bitter words which fell from his lips now—those lips which until then had never spoken to her save with loving tenderness. Cora resented it bitterly. If he had spoken frankly to her she would perhaps have found courage to tell him all; but he gave her no opportunity, and she was too proud to make one for herself. Marks had been wise in his dilineation of both characters; but proud and indifferent as Cora appeared, she suffered passionately, and alas! in her sorrow, Lord Almane's gentle words, his friendship, came like a solace and consolation. He was too wise to touch directly on her grief, or to let her see that he suspected the misunderstanding which existed between her and Sir Alan; but he showed a sympathy with, and sorrow for her, which touched the proud, passionate, bleeding heart.

But keen as her suffering was, it was as nothing to her husband's, who felt the bitterness of death itself in the thought that he could not trust his wife—the wife that he had idolized and worshipped. Jealousy is a terrible companion to carry about with one, and it haunted Sir Alan day and night. He was scarcely able to master himself sufficiently to meet Lord Almane with ordinary politeness, although not one word as to his secret pain passed his lips. That the Viscount was quite *au courant* with the state of things we, who are aware of his acquaintance with Mr. Marks, must know, and that he rejoiced at it is very certain.

"The jealous fool is playing into my own hands," he said to himself. "Cora will not stand such brusquerie, and if I give her a hint of the espionage to which she is subject, she will revolt, and the day will be mine. More especially if Marks is sharp, and awakens none of her suspicions."

"Do you know whether her ladyship has gone out, Marks?" said Sir Alan, entering the sitting-room one morning when Marks was clearing away the breakfast things.

"I think I heard Miss Spills say that her ladyship was going into the Palais Royal, Sir Alan," replied the servant, in his usual voice; "she has but just left the hotel, sir, and perhaps if you look out of the window you may ascertain."

Sir Alan strode across the room and looked out, drawing aside the lace curtains with an impatient hand. Their rooms looked out upon one of the entrances of the Palais Royal, and among the many figures hurrying to and fro Sir Alan distinguished Cora's graceful figure as she entered that "ladies' paradise". He stood for a moment, apparently hesitating whether to follow or not. As he did so a cab dashed up, and its occupant, a gentleman, alighted, and also entered the building.

Marks, who had followed his master to the window, saw his quick start, and heard the smothered exclamation with which he turned from the window, and a transient gleam of satisfaction crossed the servant's face.

The baronet threw himself into an arm-chair, and leaning his head upon his hand, appeared wrapped in deep thought. A long sigh from the man aroused him from his reverie, and looking up, he met the little deep-set eyes fixed upon him with an unmistakable air of compassion. He withdrew his gaze directly he felt himself observed: but an uncomfortable feeling lingered on Sir Alan's mind that the man, his servant, noticed that his wife was betraying him.

Rising and going to his writing-table, Sir Alan wrote a few lines, which he directed and sealed, then, seeing that the man had left the room, he rose and began pacing to and fro, evidently a prey to the greatest mental distress.

"Oh! Cora—Cora!" he said aloud, passionately: "that you whom I loved so madly, the mother of my child, should deceive me so cruelly. No—no; I will not doubt you. And yet, oh! Heaven, this is terrible!"

He bowed his head upon his hand in anguish; but after a few moments he raised it, proud and calm.

"I will trust her, I can do so," he said, decidedly; and crossing over to the bell, he rang it.

Very promptly was the summons answered—so promptly, that had Sir Alan been less preoccupied he might have suspected Marks' near proximity to the keyhole; as it was he noticed nothing but the pitying expression of his face,

"I am obliged to start to town at once, Marks," he said, not turning his face to the man, but keeping it bent over the *escritoire*. "When does the next train for Boulogne start?"

"At 11:45, Sir Alan," was the quiet reply.

"I can catch that if you hurry."

"But there is an express at 12:10, sir."

"That is better; put me up some things at once, and tell one of the waiters to call a cab."

"Yes, Sir Alan. Shall you require my attendance, sir?" he added, as he was about to leave the room, apparently struck by the thought.

"Certainly not," Sir Alan answered. "Lady Vincent could not remain here alone."

And without noticing the triumphant expression which shone on the man's face, Alan caught up the Times and turned away; but he had not read one word of it when Marks returned, although quite half an hour had elapsed.

"The cab is at the door, Sir Alan."

"Very well, Marks. Give this note to her ladyship when she returns. It contains an address I omitted to give her this morning, and," Sir Alan's voice was thick, and he stammered a little, "if you should want to write, Marks, address to the club."

"I understand, Sir Alan," replied the servant, quietly, as he followed his master down-stairs, obsequiously handing him his rugs and sticks, and giving the direction to the cabman with the utmost deliberation.

But very different was the swift step with which he returned to the *salon*, and taking up his master's note, opened and glanced it over. The few lines it contained gave him no clue to the hurried journey.

"Dear Cora," Sir Alan wrote: "I have received an immediate summons to town, and shall be absent a few days. Take care of yourself; and if you should want anything from home write to me at the club."

Having satisfied his curiosity, Marks coolly took another envelope from his master's table, re-addressed the note in a hand writing which was a perfect imitation of Sir Alan's, and sealed it with a seal which lay there.

As he replaced it on the table, he said, with a savage gleam of triumph in his glance:

"It was your turn once, Sir Alan Vincent; it is mine now. Your triumph was momentary, but my revenge will be lasting, and my tumble in the ditch will be amply expiated."

If Cora could have heard him, she would have known why his face seemed familiar to her.

Sir Alan's favorite servant was the man who had insulted her crossing the common, and whom the baronet had disposed of in such a summary manner.

CHAPTER XIX.

The Effect of a Letter.—The Night Mail.

Cora's surprise and agitation at her husband's sudden and inexplicable departure were very great, and the few cold lines he had left for her did not tend to reassure her. She summoned Marks, but he could give her no information; and then she was angry at herself for having allowed him to see what Sir Alan had not done, that until her return from the Palais Royal she was in ignorance as to his hurried journey. For some days she kept in her own room, restless and miserable; then pride came to her aid, and she tried to overcome her depression. She had denied herself to all visitors, and Lord Almane was beginning to get impatient, when one day he was admitted, and found Cora, beautifully dressed and apparently in high spirits, but without a shade of color in her fair face, and with hollow dark circles under her large eyes.

"Good Heavens! you are ill, Lady Cora," he exclaimed. "Have you had advice? Your hand is burning."

And he retained the little, trembling hand in his, and bent his velvety dark eyes upon her face with deep tenderness and commiseration.

"What is the matter, Cora?" he went on, softly. "Are you really ill? Will you not tell me? Can I not help you for the sake of old times?"

The tender tone went to Cora's heart, but she snatched away her hand petulantly, and laughed.

"What is the matter with me? Nothing but *ennui*, of course—if one can be *ennuye* in this gay city. I am glad to see you, Lord Almane; perhaps you will tell me something to make me laugh. Please don't look so melancholy yourself, you will only increase my blues until they reach the indigo shade."

"Then you are unhappy," he said, sadly and tenderly. "I cannot be mistaken in your tremors, Cora. It is not *ennui*, it is misery which looks at me through your sweet eyes. Oh! my child, how dare he marry you to make you wretched."

"You are mad!" cried Cora, trying to speak haughtily. "I am not unhappy. My husband is goodness itself. I will not hear you speak thus, Lord Almane."

"Goodness itself," he repeated, bitterly; "and yet he can leave you thus. Ah, Cora, had you trusted me I should have made your life as bright as sunshine; my love would have kept every trouble from you."

"How dare you?" flashed Cora, trembling and panting; struggling with her tears, as she leant back in her chair.

"How dare I? Because I love: because you are really mine—because you loved me once well, before you met him—before he stole you from me, Cora—Cora," he went on, passionately, "I would never have spoken thus had I seen you happy and honored. Had I known you to be a happy wife, I would have buried my love in my heart, and never by word or look would I have let you suspect that I love you still; but I find you lonely and neglected, deserted by the man to whom you have given the priceless treasure of your love, and I can keep silent no longer. I must tell you that I love you still. That I love you now as dearly—nay, ten times more so than I did in those happy, bygone days. Do you remember them, Cora?" he went on in a few moments, bending over her with inexpressible tenderness in tone and manner, "Nay, you cannot have quite forgotten them, I think. I would give the hopes and desires of years to win one of those days again—an hour, even time to hold you in my arms again, and to hear you whisper, as you did then, 'Stanley, I love you—I love you.' Nay, I can hold my peace no longer; Cora, you must—you shall hear me."

He caught the little trembling hands in his, and drew them passionately to his lips. Quivering in every limb, and almost powerless from emotion, she tried to withdraw them, but he held her fast.

"Do not struggle so, my love; do not turn from me. How can I see you ill and unhappy, and keep back the torrent of my love," he pleaded, passionately. "It is not sin, Cora, it is not wrong. He—that man whom you call husband—cares not for you. Has he not left you here to me?"

She wrenched her hands away from him, and covered her face; but he sank on his knees beside her, and as Cora felt his arms round her, her strength seemed deserting her, for she had not power to repulse him.

At this moment the door opened quietly, and Marks appeared. The Viscount sprang up and turned, frowning, to the door.

"I beg your pardon, my lady, I thought you were alone," said the man, quietly, retiring and closing the door after him.

"I am lost!" said Cora passionately. "Oh! Lord Almane, what have you done?"

"Be calm, dearest child," he murmured, tenderly.

"But that man? He will tell Alan! Ah, me, what have I done. In pity leave me, Lord Almane."

And Cora clasped her little hands beseechingly, and lifted her streaming eyes to his face.

"Leave you!" he repeated—"leave you to the mercy of a man who neglects you, and sets spies over you; I will not, Cora. I must rescue you from such degradation."

"Spies!" she repeated, vacantly—"spies!"

"Yes, that man is a spy—your husband's spy—left by him here to report on your conduct. To tell him how many times you go out and come in, and what you do and what you say. Ask him, Cora, if it be not so."

"A spy," repeated Cora, faintly. "To what intent? Why should he spy me?"

"Listen, my child," the Viscount said, gently forcing her to lean back in the *fauteuil*, and speaking with a grave, mournful tenderness. "I do not know whether you love Sir Alan, but I know this, that he is unworthy of your love, for he mistrusts you and believes you false to him! Nay, I know more than this; I know that he would willingly be freed from the ties which bind him to you. Your devotion, your love, have wearied him. He never really cared for you. He pitied your loneliness, he says, and so he married you."

"It is false," said Cora passionately. "It is false, quite false; he loved me—he loves me!"

"Loves!" repeated Lord Almane, scornfully. "*Now?*"

"Yes, now," she answered. "Why not?"

"Ask yourself, my poor child. Is his conduct towards you the conduct of a man who loves?"

"But he loved me once," moaned the poor young wife, recalling all the old happy days, and contrasting them with the loneliness and misery of the present. "He loved me once. He will love me again."

"He never loved you! I have proofs," he answered, quietly. "Cora, if I thought he loved you, if I thought your happiness safe with him, I would leave you now, and never willingly meet you again."

"Proofs! you say you have proofs! Give them to me," she said, with feverish eagerness, holding out her hand in entreaty.

"Not until you are calmer," he said quietly.

By a strong effort Cora choked back her sobs, and tried to assume some semblance of composure. The Viscount took a letter out of his pocket and slowly unfolded it.

"Did you ever hear of George Leeson!" he asked. "He was a friend of your brother's" he added, gently, "as well as of your husband's."

"Yes, I know" she answered.

"When he heard of your betrothal, he wrote to Sir Alan to congratulate him on the prize he had won. This letter is Sir Alan's answer. You recognize his writing I suppose, Cora?"

"Yes."

She snatched it from him eagerly. As she read it the color slowly forsook her cheeks, her lips paled, and her eyes closed. For a moment Lord Almane thought she would faint, and hastened to support her; but by a strong effort, she rallied, and withdrew herself from his arm.

For some minutes there was silence, broken only by the regular tick-tick of the clock on the mantel. Lord Almane had turned away; the heart-broken misery on Cora's face was not pleasant to look upon, and he stood at the window, looking out at the busy, animated scene beneath with a preoccupied gaze which saw none of it. Lady Vincent still held the letter open before her, and was gazing at it with dilated eyes, and a face whose pallor was almost livid.

"I cannot believe it!" she said, at last, with a wail of agony. "He could not have deceived me so! Alan, Alan! and I loved you as my life!"

She slid from her chair, and lay on the floor trembling and sobbing, but without tears. The Viscount lifted her in his arms and laid her upon a couch, trying by tender words to soothe her suffering; but she appeared unconscious of his efforts, and moaned feebly, holding the letter clutched tightly between her fingers.

"Alan! Alan!"

Half an hour elapsed, and then Cora sat up, and pushed her hair back from her burning brow.

"Will you leave me now?" she said, faintly. "I think you mean kindly, Lord Almane; I think" —with a caught breath—"I think you love me a little. I will write to you. I want to be alone. I think I am not very well. This has upset me,"

"My poor child!" and the Viscount pressed her hands in his, and left a long, tender kiss upon them. "I wish I could comfort you! I wish I could bear it for you! Cora, you believe me, do you not? I would give half my life to save you one sorrow."

She tried to smile, but the attempt was a failure; and as Lord Almane went away she sank back upon the cushions, and lay there, white and faint, although the blessing of insensibility was denied her.

When she was able to rise and make her way to the window, it was evening. The Palais Royal was lighted up; so were the busy street, and the gay shops; and carriages and cabs were hurrying to and fro, bearing happy people to places of amusement; and lady Cora stood and watched them with a feeling as if the brightness and gaiety mocked her own misery.

Glancing at her watch, she found that it was half-past seven, and that Marks would soon be up to prepare the table for dinner. That hateful man! she could not see him again; and she was about to ring the bell, when he opened the door, carrying a tray covered with silver and glasses.

"Send Spills to me," said Cora. "You need not lay the table; I do not want dinner this evening."

Marks bowed and retired. In a few minutes Cora's maid, a demure and starched English woman, entered.

"Spills, I want you to ascertain for me at what time the night-express leaves for Boulogne. I want to get to town immediately. Sir Alan wants me; and if I go by that train I shall catch the Folkstone night boat."

"But my lady," began Spills.

"Will you ascertain at once?" said her mistress, cutting short the remonstrance. "I need take no luggage, nor do I require your attendance. We shall return to Paris in a few days at the longest, or send for you and Marks."

Much mystified, but too much awed by her mistress' manner to make any remark, the maid went away to impart the news to Mr. Marks, who did not appear much astonished. Having given Spills the information she required, he went up to his room, and for half an hour was busily employed. Then he went down stairs, hailed a cab, and drove to the hotel on the Boulevard des Capucines, where Lord Almane was staying, and remained for a few moments in close conversation with the Viscount. At the close of the interview both seemed quite satisfied; and the handsome, aristocratic features, as well as the coarser, more plebeian ones, expressed unmixed triumph and pleasure. Then Mr. Marks re-entered his cab, returning to the "Grand Hotel du Louvre."

"The night train leaves at 9.40, my lady," said the maid, returning to the *salon*. "It only stops once, at Amiens, and will be quite in time for the Folkstone steamer."

"Very well; I will change my dress now, Spills. Give me a dark, warm one, and put my ulster and my traveling-bag ready. Then bring me a cup of strong coffee."

Cora was quite calm and self-possessed while the maid took off her dainty silk dress, and replaced it by a dark blue serge; but her heart was beating violently, and her pulses were throbbing quick and fast; and she had but one thought—to get to Alan, and tell him all, and implore him to give her back his love and to take her to his heart again. It was a wild, thoughtless plan, reckless, indefinite; but Cora's brain was in a whirl, and she did not pause to think. If Alan did not love her—had never done so—she would creep away somewhere and die, and trouble him no more; but at least she must know it from his own lips.

At nine o'clock Spills knocked at the door and announced that the cab was waiting, and on the landing without Marks waited to escort his mistress.

"I require no one with me," said Cora, sharply "Do you hear me, Marks?"

"May I not accompany you to the station, my lady?"

"No; I am going alone."

So Marks followed her quietly down the broad staircase, and some of the loungers in the hall turned to have a second glance at the *belle Anglaise* who had created no small sensation at the hotel, not merely on account of her own beauty, but for the prestige attached to her husband's name. She was looking pale and resolute, and the large hat she wore shaded her face, as she passed on calm and indifferent. Marks put in the traveling-bag, and assisted her to enter the cab, giving the man the same direction as he had given Sir Alan's coachman.

And as the man drove away the servant stood and watched it disappear, with an evil smile on his lips.

"That fellow reminds me of Mephistopheles," said a young Frenchman, as he passed by, to his companion. "I should call that a face of the police-court."

Cora was driven rapidly through the lighted streets She had thrown herself back in the cab and covered her face, as she began to feel the rashness of the step she had taken; but she would not return. She felt that she must escape from Lord Almane in the first place, and the longing to see her husband was strong upon her If she went to him, told him the past, and assured him that her heart was his and his only now, he would believe her, surely he would for their child's sake.

Lord Almane's words had sunk deep, still she did not believe them all. She knew her husband was too noble to wish her dishonor, but so many little things once unnoticed came back to her now. She recalled Marks' constant appearances, especially when Lord Almane was with her; she knew that the occurrence of the day had placed her in the man's power; but Alan should know all from her lips, not from the servant's; and if he believed him in preference to his wife, she must submit.

By the time they reached the Rue de Dunkerque she had checked her tears, and was able to dis-

miss the cabman, and obtain her ticket without attracting any attention, while a porter, a little struck with her appearance and manner, allowed her to go on the platform, and found her a seat in a carriage before the other travelers, who were few in number, were freed from their "durance vile" in the waiting-room.

Very impatiently Cora waited for the time to pass, and it was a real relief when she saw the waiting-room doors opened, and heard the guard summoning the travelers for "Amiens and Boulogne." She leant back in her carriage, hoping to be left alone, but as she did so she fancied she recognized a likeness to Marks in the appearance of a man upon the platform, but the idea only made her shrink further back.

The whistle sounded and they were off, when the door of the carriage she was in was rapidly opened, and, even as the train moved away, a traveler sprang in and took his seat, while the porter, whom Cora recognized as the one who had found her a seat, closed the door, and turned the handle securely.

CHAPTER XX.

A Terrible Journey.

For some minutes Cora did not even turn her head or glance at her fellow-traveler; but when she did so, she could distinguish nothing except that he was muffled up, and wore a slouched hat, which, if it were a precautionary measure, was a very effectual one. Occupied with her own sad thoughts, Lady Vincent soon forgot his presence, and thought no more of him. Now that she had leisure to reflect over her hasty action, she could realize how unwise she had been, how imprudent. She was in the power of an inferior, and she feared an unscrupulous man: and she felt very bitterly towards her husband when the thought obtruded itself that he had placed that man there to spy her. Lord Almane occupied her but little, all her thought was given to Sir Alan; and the one wish present with her, as they sped onwards, was to see him again, and justify herself, if she could, in his eyes. As they went on, as she felt herself every moment approaching him, and pictured the meeting, all the bitterness and pride faded, and sadder, softer thoughts came: thoughts of the wedded happiness and peace which had been hers so long—thoughts of her husband's tenderness and goodness, and of their child—their bright, beautiful boy—whom she would soon see again. Sir Alan's harshness, and the constraint of the past few weeks, were all forgotten; she remembered nothing but his love, his consideration. He must have loved her—he could not have feigned such devotion; and when this gulf which seemed to have opened beneath their feet had closed again, he would love her still. Cora's tears flowed fast as she bowed her head upon her hands, and her agitation shook her delicate frame with hysterical violence.

Suddenly she felt her hands removed from her face, and, looking up, she saw Lord Almane's handsome countenance, full of passion and eagerness, bending over her.

"My own darling, devoted love," he murmured, passionately. "How can I thank you? Cora, trust me, you shall never repent this step."

And he drew her to his breast, and tried to press his lips to the quivering lips and tear-stained cheeks; but with a fierce strength Cora threw him off, and recoiled indignantly.

"What!" he said, gently. "Still coy—still unkind! Nay, Cora, after such a proof of love as you have given me, you can no longer feign indifference. It were absurd to do so."

"This persistence is unmanly, Lord Almane," said Cora, through her sobs. "How dare you persecute me thus?"

But even as she spoke a sense of her own helplessness struck her with terror, and she tried vainly to suppress any signs of agitation.

The Viscount smiled.

"If you had not written to me, Cora," he said, quietly, "I should begin to imagine that my presence was distasteful to you; as it is, my darling, I can understand your agitation. It is but natural; but you must not carry it to such an excess, love, or you will be ill."

His quiet tone and manner transfixed his hearer with astonishment.

"Written to you," she repeated, haughtily. "You are under a strange delusion, Lord Almane."

"A warrantable one under the circumstances, my child. Is not this your writing?"

And he held up to her view a little note, folded and addressed to "Lord Almane."

"Yes," said Cora, at once.

"And this?"

As he spoke he unfolded the note. It was written on paper which bore her monogram, and at the first glance she thought the handwriting hers; the second undeceived her.

"I did not write that," she said, disdainfully.

"The writing is yours, Cora!"

"It is an excellent imitation. Your forgers are clever, Lord Almane."

"My forgers!" he said. "What folly is this? On my honor this note was brought to me by your servant. It is in your writing. In obedience to its request I am here—here at your feet—your willing slave, dearest! Do not trifle with me, Cora."

"Lord Almane," said Cora, suppressing her emotion by a strong effort, "you are the victim of some strange plot. On my honor—on my life—I never wrote that note!"

The Viscount hesitated unwillingly, and yet was forced to believe her. But he would not easily give up the prize he had been so sure of winning.

"If I am the victim of a plot, we suffer together," he said, quietly. "Do you remember what I told you this afternoon? that Sir Alan Vincent would gladly be free from the chains that bind him to you?"

"Yes," she answered, breathlessly, lifting her eyes to his in expectation, as he sat opposite to her.

And the train flew on rapidly through the still country.

"He is taking his measures accordingly," he went on. "Do you know that such a thing exists as a Divorce Court, Lady Cora, and that your husband has sufficient evidence against you to win his cause in one?"

"I do not understand you," she answered, faintly, as she sank back upon the cushions.

"It is not my forgers who are clever, Cora," rejoined the Viscount. "They are his—your husband's! I told you he had his spy. There is a diabolical plot against you my poor child; but if you will trust me, I will do my best to save you."

Cora was powerless to speak, as he rapidly told her that Sir Alan was getting up a chain of evidence against her, in order to obtain a divorce.

At first, this unhappy woman refused to credit him; but he brought proof upon proof in favor of his words, and, unable to cope with his practised eloquence and persuasion, poor Cora sank shivering and cowering into her corner, praying for death.

And then, when he had, as he hoped, destroyed all her confidence in, and love for Sir Alan, the Viscount pleaded his own cause with an impassioned eloquence worthy of better things. He dwelt upon his long existing love for her, the suffering he had endured, the protection his love would be to her in the future, when she would be deserted by all; but most of all he dwelt on the fact that Sir Alan had left her alone in Paris, knowing that he, Lord Almane, was there.

"He cannot but see how dearly I hold you," he concluded. "Do you not see that he is willing—that he wishes to be rid of you?"

Cora had let him plead without interruption. She knew that she was in his power for the present; but her whole soul revolted against the man who could take such a base advantage of her helplessness and trouble. She covered her face with her hands, with a swift prayer to Heaven for help and direction in her hour of need.

The Viscount thought that he had triumphed—that she was yielding; and he loved her well enough to rejoice, as well as to exult in his victory.

"Do you remember telling me once, long ago, that you wished my happiness above all earthly things, Cora? and you can make me so happy. You will come with me, love, will you not? And we shall be so happy, my beloved! My whole life shall be devoted to your happiness, and to the welfare of my honored wife!"

Cora moved her hands from her face, and lifted her eyes to his, and that one glance, so full of repugnance and horror, showed the Viscount that he was reckoning without his host.

He stooped over her, and tried to encircle her with his arms; but she recoiled.

"Wait one minute," she said, feebly—"one moment yet. You say that I will be your honored wife, Lord Almane; but that would be impossible. The step you urge would deprive me of all claims, not only to your respect, but to my own. Do you think I could be happy, even if I loved you, knowing that I was disgraced in the eyes of all mankind? but I do not love you. I loathe—I despise you as I would any man who would so basely betray a weak woman! If my husband believes in my guilt I must submit to bear the punishment; But at least,"—she rose up proudly, her slight form swaying to and fro, her eyes flashing—"I shall have the consolation of knowing my innocence!"

Again he drew near to her with tender words and gestures, but with a fierce strength she threw him off, by look and word expressing her detestation of his unscrupulous passion. It was an unequal struggle, for Cora was faint and exhausted, but he saw that she was in earnest, and he desisted.

"You will repent this," he said, fiercely; "you will repent having cast away the only love which is left you, and the day may come when you will crave for it and when it will be denied to you. Cling to the husband who scorns you, and my revenge will be ample, knowing that if you love him that love will be your greatest curse."

"Ah, Heaven, have pity, moaned Cora, as her fictitious strength deserted her, and once again she sank back upon the cushions and looked out on to the dark night with despairing anguish. Was there no help for her, no respite from the taunting words which were lacerating her tender heart?

Suddenly, surely she was not mistaken, the speed seemed to slacken; they were stopping. Her heart almost stood still as she rose in breathless expectation; lights appeared then; they were entering a station, and with a sob of relief and a passionate "Thank Heaven!" Cora realized that they had reached Amiens.

"Amiens, Amiens; twenty minutes stoppage," shouted the porters as they ran along the station and opened the carriage doors. "Twenty minutes here."

"Cora, what are you going to do?" said Lord Almane, as he saw her rise and prepare to alight, although she seemed hardly able to support herself, and was trembling from head to foot.

She did not heed the question, but passed him and got out. The Viscount followed her as she went on with faltering steps, and came to her side.

"Cora, let me help you; you are ill," he exclaimed, touched in spite of himself by the haggard misery and exhaustion visible on her face. But she pressed on unheeding.

Just as they drew near the waiting-room a gentleman appeared from within, and came slowly towards them, his face deadly white, and bearing an expression of anger terrible to read.

One glance told the Viscount who he was and he drew back momentarily with a smothered exclamation, at which Cora lifted her eyes. As she did so she uttered a cry, a wail of anguish, which rang through the station, thrilling all who heard it with its terrible woe, and fell forward insensible at her husband's feet.—[To be continued.

RECENT LITERATURE.

Science Primers. Edited by Professors Huxley, Roscoe and Balfour Stewart. 12mo.—Illustrated. New York: D. Appleton & Co. 50 cts. each.

It was a happy thought that led to the publication of these Science Primers. The series consists of an introductory volume followed by Chemistry, Physics, Physical Geography, Geology, Physiolgy, Astronomy, Botany, Logic, Piano Playing and Inventive Geometry. Each volume contains from 125 to 150 pages, and when necessary to the proper understanding of the text, is fully illustrated. The style is plain and concise, adapted to the understanding of youth, but none the less interesting and instructive to older people. The subjects are treated by different authors who aim in few words to set forth the principles thereof, and it is astonishing to see how much of the groundwork of each science is presented. One who reads these primers thoroughly, will obtain sufficient knowledge to enable him to understand the general principles, at least, of the subjects on which they treat. It is not to be expected all details can be comprised within the compass of volumes of the size of these; but the reader will gain from them sufficient instruction to enable him to read more intelligently all matters bearing on the subjects of which they treat. To those who have been familiar with the sciences in their school-days, these books will serve to refresh the memory and awaken interest. We have no doubt many, after giving them examination, will feel as we do, that we would not give them up were their cost much greater than it is. Each volume can be had separately.

MAGAZINE NOTES.

The leading contributors to the June number of Sunday Afternoon are E. E. Hale, S. G. W. Benjamin, C. F. Thwing, Josephine R. Baker, Rebecca H. Davis, Susan Coolidge and Rose Terry Cooke. The articles continue to be varied and attractive, and readers miss an intellectual treat of the best kind if they do not hasten to secure a snug nook in the place "where it is always afternoon."

Arthur G. Sedgwick contributes the most thoughtful and important paper to the June Atlantic. "Unforeseen Results of the Alabama Dispute" are results that it should have behooved our legislators to have foreseen. "Detmold" is concluded, and Warner continues to verify the Adirondacks. The Contributors' Club is vigorous in this number—a great many speaking at once.

Volume XLII commences with the July number—a good time to subscribe.

St. Nicholas is charming. Miss Alcott's story, "Under the Lilacs," the funny "Master Montezuma," "How to Make a Telephone," "Dab Kinzer," "Jack-in-the-Pulpit" and the "Riddle Box" will entertain every one until the July issue makes its bow.

The leading article in Scribner, June number, is an appreciative one by Russell Sturges on George Cruikshank, with good copies of his most spirited etchings. "Bird Architecture" is handsomely illustrated, and W. J. Linton takes up the cudgel in behalf of engraving as a fine art. The poetry is good. Dr. Holland certainly knows how to make a magazine, and is creating a standard that other illustrated magazines must conform to, or be left behind in the race.

The American Naturalist for June contains "A Lesson in Comparative Histology" (with plate 2), Chas. Sedgwick Minot; "Rambles Around San Francisco," W. N. Lockington; "Phosphorescent Insects, their Metamorphoses," Mrs. V. O. King; "On the Genealogy of Plants," Lester F. Ward, A. M.; "The Mode of Extraction of Silkworm Moths from their Cocoons," A. S. Packard, Jr.; and general notes on Botany, Zoology, Anthropology, Geology, Paleontology, Geography, Travels and Microscopy, beside scientific news and reviews of recent literature. A glance at such a table of contents must prove very tempting to any one who is interested in any branch of science.

Littell's Living Age, published by Littell & Gay, Boston, is a continuous feast of good things. A year's reading of the admirable selections which appear in it from week to week, is equivalent to a moderately liberal education. The last number (May 25) contains a review of Lecky's History of England in the 18th Century, an instalment of Macleod of Dare, From the Quirinal to the Vatican, The Comet, The Apollo Belvidere, Conossa, Retrospective Sympathy, and two poetical selections. Peculiar, indeed, must be literary taste which cannot find something to its liking among such a number of articles.

The Domestic Monthly.—Fashion has a thorough and reliable exponent in the popular Domestic Monthly. The June number devotes twenty of its large pages to the considerations of Fashion, which are divided up into a comprehensive review of fashion, giving full information concerning prevailing and forthcoming novelties in all its departments, and articles (nearly all illustrated) on Seasonable Fabrics, Trimmings, Summer Wraps, Children's Fashions, Novelties in Ladies' Under-clothing, Millinery, Coiffures, *Lingerie*, "Domestic Art"—fancy and needle work, decoration, etc.

The literary contents are: an instalment of Mary Cecil Hay's charming serial, "Her Three Lovers," poems by "Dorr," Fanny Clipsham and others, several very entertaining short stories, an interesting paper on "Lace," and No. 9 in Eben E. Rexford's instructive series of "Flower Talks." The Miscellany, Small Talk, Household Departments, Critiques of New Books, Mosaics, etc., offer a great deal of entertaining and instructive reading.

BRIC-A-BRAC.

Mr. Dusenberry's daughter
Plays "Baytoven's Moonlight Snorter,"
While the world sits all enraptured
And the noodleheads are captured
By the dignity and ease
With which she ballywhacks the keys;
And she wanders all the while,
Through andante cantabile,
Vivace and allegro,
Forte, pianissimo,
Staccato, fugue, roulade,
Scherzo, tempi, crescendo,
Diminuendo, faro, keno,
Sostenuto, claro, maduro,
Oscuro, Colorado, bureau,
Con moto, con expressione,
Con undrum, mezzo, adagio,
Con durango, con stipatione,
Con o'hardin and con maguire.
Gracious hevings! What's the wonder
We are startled by such thunder?
Foolish, silly maid, you oughter
Lay aside that "Moonlight Snorter"—
Let it climb the golden stair.
Give us rather "Maiden's Prayer."
"Swanny River," "Hazel Dell,"
Or the "Monastery Bell,"
Pull, fair idiot, down your vest—
Give the "Snorter" kind a rest.

[*N. Y. Post.*

One Hundred Years Ago.—One hundred years ago not a pound of coal, not a cubic foot of illuminating gas had been burned in this country. No iron stoves were used, and no contrivance economizing heat employed until Dr. Franklin invented the iron-framed fire-place, which still bears his name. All the cooking and warming in town and country were done by the aid of fire kindled in the brick oven or on the hearth. Pine knots or tallow candles furnished the light for the long winter nights, and sanded floors supplied the place of rugs and carpets. The water used for household purpose was drawn from deep wells by the creaking sweep. No form of pump was used in this country, so far as we can learn, until after the commencement of the present century. There were no friction matches in those early days, by the aid of which fire could be easily kindled; and if the fire went out upon the hearth over night, and the tinder was damp, so that sparks would not catch, the alternative was presented of wandering through the snow a mile or so to borrow of a neighbor. Only one room in any house was warm, unless some of the family were ill. In all the rest the temperature was at zero many nights in the winter.

ADOON THE LANE.

Upon ane stormy Sunday,
Coming adoon the lane,
Were a score of bonnie lasses—
And the sweetest I maintain,
Was Caddie.
That I took beneath my plaidie,
To shield her frae the rain.

She said the daisies blushed
For the kiss that I had ta'en;
I wadna hae thought the lassie
Wad sae of a kiss complain.
"Now, laddie!
I wadna stay under your plaidie,
If I gang hame in the rain!"

But on one after Sunday,
When cloud there was not ane,
This self-same winsome lassie—
We chanced to meet in the lane—
Said Caddie,
"Why dinna ye wear your plaidie?
Who kens but it may rain?"

NAUTICAL CATECHISM.

If a ship misses her stays, how do you find in what direction her course sets?

Will the ship heel over if you tow her out?

How many horses does the captain drive in his gig?

Did the man who took his trick at the wheel do it with the right bower?

Can you get a "night-cap" at the cap-stan bar?

When the boatswain pipes all hands who furnishes the tobacco?

How many knots are in the ship's log?

Is the ship's screw drawn by a screw-driver?

Is the keel son any relation to the cabin boy?

Did you ever spin the main top?

If the captain snores ought it to be set down as a head-wind?

When the ship's ropes are all taut is it any evidence that a schoolmaster is on board?

Does the captain get his wine out of the port holes?

Is there any way of making the cross-trees good-natured?

Is the yard *arm* over three *feet* in length?

Do you know how to wind up the larboard watch?

MR. WHITTIER AND THE JAR OF BUTTER.

Some years ago a lady residing at Pond Hills, a little hamlet near the home of the bachelor poet J. G. Whittier, presented him with a jar of butter, for which he returned the following characteristic expression of thanks:

"Words butter no parsnips," the old adage says,
And to fill up the trencher is better than praise.
So, trust me, dear friend, that, while eating thy butter,
The thanks that I feel are far more than I utter.

Kind Providence grant thee a life without ills,
May the cows never dry up that feed on Pond Hills,
May the cream never fail in thy cellar so cold,
Nor thy hand lose its cunning to change it to gold!

Thrice welcome to him who, unblest with a wife,
Sits and bungles alone at the ripped seams of life,
Is the womanly kindness which pities his fate,
And sews on his buttons or fills up his plate!

I wouldn't give ten cents a yard for all the pedigree in this world; if a man hez got a level head on his shoulders, and an honest hart in hiz body, he hez got all the pedigree I am in search ov.—*Josh Billings.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

PITHS.

LET the children have pets.

Good flour should be of a creamy white.

Ornament your dining table with flowers.

Keep brown flour on hand for thickening gravy.

Coffee which has not been roasted improves with age.

Stews if properly made are healthful and digestible.

Cooks make a mistake in thinking all soup should be thin.

Lemon juice is a strengthener of the nervous system.

Reheating coffee just before grinding brings out the flavor.

Make two large pockets in your kitchen apron and in one of them always keep a holder.

"In dressing salad mind this law:
With two hard yolks use one that's raw."

Suet chopped fine and mixed with flour and then tied down tightly in a jar will keep good from ten days to two weeks.

One drop of the attar of roses on a piece of white paper to a pound of tea imparts a very fine flavor—keep the canister closely covered.

The economy of the French is proverbial, and the following is only a fair sample: All pieces of dry and damaged bread are utilized. Some of it is dried in ovens and used in soup at low-class restaurants, some pounded into a white paste and used by meat-men to ornament cutlets, while the poorest crusts are reduced to charcoal and converted into a tooth paste.

COOKING.

MY plans for cooking do not consist so much in weighing, measuring or implicitly following directions, as in endeavoring to use judgment and tact, if it may be so called. For instance, before commencing to cook a meal, I set my wits to work to devise a plan for the meal. I consider first, how much time and expense I wish to expend, and what my seasonable resources are; and if some things which are generally required are not attainable, I must substitute others, or I must strive to arrive at the desired result—a wholesome meal well served—by some other route. My cooking, both from principle and necessity, is generally very plain. I am an advocate of a simple, plain and *very* neat system of cooking, having regard for both purse and digestive organs. A little experience and scrupulous care, combined with good taste in serving, will, providing the materials are fresh and well-kept, enable one to prepare a meal fit for a king, or what is much more desirable, fit for one's own family, with but little time and waste. I think as much care and skill are required to properly prepare bread, coffee, potatoes and common articles of food, as in the manufacturing of rich pastry, cakes and sauces; and young housekeepers, and old ones too, for that matter, should take more genuine pride in preparing each meal carefully and economically than in being able to get up rich, costly, and often unhealthy food for special occasions on company.

Negligent habits in throwing away, or what is not much better, placing on the table remnants of food, cold in the dishes in which they were formerly served, is almost sure to disgust or cause it to be again left. Whereas, if it were rewarmed in a skillful manner, or used to prepare something of an entirely different form, it would serve to make very palatable dishes.

I get some very useful hints from recipes, but I seldom use them without some change to accord with my own circumstances.

Iowa. MRS. MARY B. B.

ORNAMENTATION CARRIED TOO FAR.

WILL you allow me to ask if some one will not through the RURAL give young ladies some instructions how to make themselves useful? This ornamentation I think is being carried a little too far. Our daughters could surely be much more sensibly employed if they spent a little more time in the kitchen assisting their over-burdened mothers and less in pasting pagan pictures on jars etc., and then calling it ornamenting. It seems strange to me that an enlightened and civilized people should desire to have such reminders of Paganism in their homes. I do not wish it understood that I object to ornamenting our homes providing there is good taste shown and not so much time given to it as to exclude the useful. I, however, wish the two could be more equalized, hence the appeal. MRS. P. W. A.

AN EXCELLENT HOME PASTE.

ONE ounce of the best gum tragacanth; a teacupful and a-half of clear soft water and a bit of corrosive sublimate, not larger than a pea. Free the gum from all impurities and put it with the corrosive sublimate into an earthenware vessel having a close cover; add the water and let stand where it will be kept warm—not hot. Stir with a *stick* several times during the day. When properly dissolved the paste will be smooth throughout. This is a very convenient paste for housekeepers, and it will keep good for a year. AUNT KATY.

DOMESTIC RECIPES.

Indian Corn-Bread.

THREE cupfuls of corn-meal and one of Graham; one-half cupful of molasses in which dissolve a teaspoonful of soda; one pint of sweet milk and one teaspoonful of salt. Stir together with a spoon and steam three hours and then bake one-half hour.

Cream Pie.

The following recipe for cream pie we have never seen in print. It is fully equal to lemon pie and can be made when it is difficult to get lemons.

Make and bake two nice under-crusts. Take one pint of milk; four eggs, reserving the whites of three to put on top of the pies; one cup of sugar; one-half cup of flour; stir the sugar, eggs and flour to a paste; pour in the milk; place over the fire and stir constantly until it boils; let cool a little and flavor lightly with lemon extract. Pour into the crusts; beat the whites very light; add one-half cup of sugar and spread over the pies. Bake very slowly.

Pork Fruit Cake.

Chop one pound of salt pork very fine; pour one pint of boiling water over it; add one pint of molasses; two cups of sugar; one teaspoonful of soda; one pound of raisins; one pound of English currants and one-half pound of citron; spice to suit the taste. Mix in flour until quite stiff. This makes a nice light cake without eggs and one which will keep six months.

Toothsome Molasses Cake.

One cup of molasses: one cup of sugar; one cup of butter; one-half cup of sweet milk; two eggs; one teaspoonful of soda; one teaspoonful of ginger and two each of cinnamon and allspice; two and a half cups of flour.

Michigan MRS. MINNIE ELLIS.

Raspberry Short-Cake.

Stir into one quart of flour two teaspoonfuls of cream-of-tartar and a little salt; add two tablespoonfuls of thick cream or rub into the flour one large tablespoonful of butter or lard; dissolve one small teaspoonful of soda in a little milk; mix with milk; bake quickly and thoroughly; then cut open and lay in sweetened raspberries, in abundance, as prepared for the table; close again quickly while hot that the berries may cook somewhat. To be eaten with or without a sauce. RURAL READER.

Cherry Pudding.

One cup of sour milk; one beaten egg; two tablespoonfuls of butter; one-half teaspoonful of soda; flour to mix; roll out thin; spread the fruit over the paste and roll up; put into a floured bag and boil for one hour. May be served with a brandy sauce. MISS CRONK.

QUERIES ANSWERED.

CAN you give an effective remedy for the early destruction of flies which are now, with us, becoming annoying? Also a good method of preparing stoves before putting them away for the summer to prevent rust, which in our sea-air is very damaging? W.

ANS.—(1) In the Domestic Department of the RURAL of March 30th, the proportions of a very good home-made fly poison were given which, if prepared and placed in each room, will speedily lessen the number. You must, however, be provided with screens for both doors and windows, and then see that each member of your family keeps those net doors and windows closed. Never allow the garbage-pail or pans of sour milk, etc. to stand within or without your kitchen door. Nothing but care and watchfulness will keep your house free from flies.

(2) Asphaltum varnish thinned with a little turpentine and applied with a brush; or mix stove polish with kerosene until of the consistency of cream, and apply thickly with a rag; then wrap in papers.

News of the Week.

NEWS OF THE WEEK.

NEW YORK, Monday, May 27, 3:30 P. M.

FOREIGN NOTES.

The prevailing drift of opinion is peaceful. The Russian Count Schouvaloff has had an interview with Lord Salisbury, and the impression created is favorable. St. Petersburg journals hint that the Congress is again a possibility.

The news from Constantinople is less tranquil. A number of Turkish refugees and conspirators headed by Ali Suavi, have made a fruitless attempt to depose the Sultan in favor of the idiotic Murad. Ali Suavi was shot by the guard. Besides, the Russians advancing their lines nearer Constantinople, have been met by warlike preparations on the part of the Turks, and both are reinforcing and fortifying vigorously, while a commission composed of Russian and Turkish Generals has been formed to draw a distinct line of demarkation, on which it has come to no understanding as yet.

Russian emigrants are passing through Germany. It is believed they are sailors in disguise bound for America. Two unarmored Russian war ships have left Cronstadt, presumably for America. Russian agents are also busy inspecting the shipping in Sweden with a view to purchasing cruisers. Moscow merchants have contributed 400,000 roubles towards forming a volunteer fleet.

The weather continues unseasonably cold.

The Duchess of Argyll is dead.

Prince Gortschakoff has had a fresh attack of gout.

The Chinese Government has offered a new loan of 2,000,000 taels, with the customs revenue as security.

Japanese officials think they have discovered a conspiracy against the existing order of things and there are wholesale arrests accordingly.

The English and Russian Asiatic squadrons follow each other about closely from port to port, and trade in those seas is very dull in apprehension of a war.

Recent weather in England unfavorable to crops.

The Pope is seeking a place away from Rome to pass the summer. The Jesuits are endeavoring to keep him in the Holy City.

The Manchester Guardian concludes from the reports of the proceedings of the operatives at all points in the strike district that little disposition exists to accept the ten per cent reduction even temporarily. The spinners declare that they would accept five per cent reduction outright and nothing more. This attitude will prolong the strike indefinitely, but attempts to secure a compromise will be continued. There have been no further disturbances, nor is there likely to be, because of the military precautions. There is a scheme to put the reduction to a ballot. It has been done at five points with the results of only 323 for the proposal to 12,972 against it. The Trades Union Congress Committee have tendered their sympathy and support to the cotton strikers.

The Vatican is trying to come to an agreement with Germany, with faint hopes of success.

The German Parliament is debating the anti-socialist bill. The Government declared the bill urgently necessary for the welfare of the State, but the opposition is sufficiently strong to prevent its passage. In either event the Government will pursue the socialist organizations with vigor in consequence of the recent attempt on the Emperor's life.

The suspension of diplomatic relations between Germany and China is imminent. That means fight.

A great fire at Constantinople, within the precints of the Porte, destroyed a greater portion of the buildings including the ministries of Justice and Council of State.

The town of Reynoser, Mexico, has been captured by the Lerdo revolutionists, and a *prestamo* of $8,000 levied. The party has moved southward.

Reports from the districts of Venezuela recently devastated by the great earthquake, indicate a very widespread destruction of property and distressing loss of life. The town of Cua was completely destroyed by the heavy shocks of April 14, and all the surrounding plantations and settlements shared the same fate.

Before and during the progress of the convulsion the heat over the districts visited became intense. Even the rivers were rendered unbearable for the fish, which leaped out of the water.

The severity of the shocks was greater than has been before experienced by the present generation.

From Halifax, N. S., news comes of the explosion in the Old Sydney Mines, resulting in the death of six men.

The first persons to enter the mine after the explosion were three brothers named Sullivan, who succeeded in rescuing thirteen of the cutters who were overcome by the gas. They were unconscious for some time, but all are slowly recovering. Sixteen pairs of cutters were at work here.

The Belgian government is about to ask an explanation from the United States concerning our criticism of Mr. Delfosse.

POLITICAL NEWS.

The Senate has been discussing, in Committee of the Whole, the bill providing a permanent form of government for the District of Columbia.

There has been an election affray in Norfolk, Va.

The Senate in executive session rejected the nomination of John B. Frothingham to be Assistant Appraiser at the port of New York. Mr. Conkling made a speech against the confirmation.

The Senate Committee on Commerce has called upon the Secretary of War for information in relation to a number of the proposed river and harbor improvements provided for by the House Appropriation bill, and will not finally act upon the bill until the information is received.

The National Democratic Committee in caucus has adopted the following: "Resolved, That the action of the House of Representatives in appointing a committee fully empowered to investigate and report upon the frauds alleged to have been committed in the late Presidential election, to the end that the truth may be made known to the people and the repetition of such frauds be prevented in the future, meets the approval of this committee."

The Investigating Committee is not under way yet, but both Democrats and Republicans are busily preparing for the work of inquiry. It is understood that General Noyes has already asked for leave of absence, in order to come here and confront any one who may come forward to accuse him before the committee. Secretary Sherman has been in consultation with leading Republicans, and these say that they feel absolutely certain that no wrong or even impropriety can be brought home to the Secretary. Mr. William E. Chandler is understood to be engaged with the Republicans in looking into the Florida case. The Democrats keep their own counsel, but it is believed that they are looking over lists of witnesses which have been furnished them by Morton for the Florida case and by others for that of Louisiana, and preparing their plan of operations.

Representatives Herbert, House and Hunton, of the committee charged with the consideration of the method of electing President and Vice-President, dissent from the plan proposed by the majority. This plan proposes, in brief, to allow each State a number of electoral votes equal to the number of its Senators and Representatives in Congress, but to prorate these votes among candidates according to the popular vote. Each candidate for President and Vice-President is to have allotted to him his aliquot proportion of the electoral vote of every State in which he is voted for. These when counted and ascertained, must be forwarded to Washington, and the candidates having a plurality of the electoral votes shall be declared elected as President and Vice-President.

The Vermont republicans have nominated Col. Redfield Proctor for Governor, unanimously: Their platform says: That the motives and general course of the administration of President Hayes have our hearty approbation, and, though a difference as to policy may exist, we rejoice in the belief that both the Executive and republicans in Congress are disposed to suffer no divisions.

GENERAL NEWS.

Reduced freight rates between New York and St. Louis, per 100 lbs.: 87, 70, 58 and 46, for the four classes.

Coal mining in the Schuylkill is about to be suspended for two weeks.

Much cows are dying near Independence, Mo., apparently as a result of eating clover. New disease—consternation among cattle dealers.

Another new American steamship launched. The City of Para.

The female branch of the Executive is trout-fishing. Mrs. Hayes was in luck to the extent of 20 pounds of trout. Scene: Saranac Lake, N. Y.

Depot Hotel at Lemars, Iowa, burned; cause, kerosene.

The tonado in Wisconsin damaged the town of Perry, Waukesha, Mineral Point and adjacent territory. Thirty killed, about one hundred injured, and damages to the extent of $20,000. Desolation extreme.

The Bonanza Kings Flood and O'Brien are sued for ever $35,000,000 by J. H. Burke.

The North and South Presbyterians are in session at Pittsburgh.

Factories in Fall River, Mass., are suspending work temporarily.

The Russians have bought a new patent torpedo in New York.

Confederate graves were decorated in Baltimore, on the 23d inst.

Young Men's Catholic Union Convention convened in Buffalo, N. Y. Also the Buffalo Sportmen's Convention.

The rowing regatta on Seneca Lake promises well.

The Columbia Crew have sailed for England to row the University Crew.

The amount collected for tolls on N. Y. Canals from May 15th to 22d, was $1,341.37.

Russian agents are in San Francisco ready to issue letters of Marque to a privateer.

Indian raids are reported in the vicinity of Diamond City, M. T.

The revenue agents are on the whiskey war path. A prominent distiller has been arrested in Cincinnati.

A pleasure yacht went over a dam in Galt, Ont. Several were spilled out and drowned.

Disastrous floods reported in Colorado. Railroads damaged, and loss of life and property.

A destructive fire at Hartford, Conn. Two firemen killed, six injured. One of the finest buildings destroyed.

The Canadian Mounted Police are watching Sitting Bull. He is becoming restless. The troops on the Plains are being recruited.

The Cincinnati Music Festival, lasting a week, was a great success in all respects.

President Hayes and party attended the ceremonies at the Hampton Agricultural Institute, Fortress Monroe, Va.

The suit of the C. & A. Railroad *vs.* Tilden *et al*, is in on the U. S. Circuit Court for Illinois.

Peter Cooper, philanthropist and greenback candidate has been sued for a large amount in Brooklyn, N. Y., on account of libel. The jury disagreed, four insisting on six cents damages, eight for acquittal.

Another scandal in Plymouth Church. A Sunday School teacher charged with drugging and violating a lady.

The Social Science Convention held its annual meeting in Cincinnati. The papers read were important.

Grace Church, New York, has three organs that are played by one man. Electricity connects the keys and stops.

The South Boston Iron Co. are coquetting with the Russian Government for the casting of monster cannon, and the British Consuls are narrowly watching and reporting all transaction completed by the Russian agents.

PUBLIC OPINION.

Comments of the Independent and Partisan Press.

SPEAKING of the Fishery Award, the *N. Y. Times* (Rep.) concludes that:

The payment should be made subject to a protest that will clearly set forth the American feeling in regard both to the unreasonableness of the award and its admissability as a precedent. Taking the facts as proved, this is the state of the

case: This country pays for the privilege of access to the Canadian inshore fisheries, for twelve years, many times more than the value of all the fish caught; and at the same time concedes to the Canadians admission free for products which yielded a revenue of between $200,000 and $300,000 yearly. In addition to the $5,500,000, therefore, we shall indirectly give the Canadians about $300,000, during the period stated, in the shape of duties remitted. And all for a privilege which, on the basis of the past, will not, in the twelve years, yield a million and a half!

This is what the *N. Y. World* (Dem.) says apropos of the Resolutions:

But as the time rolled on it became daily more plain that within the bosom of the party of which Mr. Hayes had been the candidate, grave doubts existed as to his having been chosen by the people, and as to the character of the methods by which his inauguration had finally been secured. Was it to be expected that the Democrats who for nearly two years have been laboring under the stigma of idle vaporing about unproved frauds should neglect this opportunity at one and the same time of vindicating the complaints of their party, and the outraged institutions of their country? Certainly not by candid and reasonable men.

Criticising the recent Address of the Republican party, the *Louisville C.-Journal* (Dem.) speaks its mind as follows:

Here is a party which for seventeen years has had possession of the Government, having the effrontery to talk about "the paralyzation of industries," and "anarchy," and "peace." It is equally false and funny. But it is very characteristic of the hypocrites and bullies who have put it forth. Yet there is a potency in their scheme and outcry. This is the dilemma, however, presented to the Northern mind, which puts the South at a disadvantage. If we gush over the flag, and emit a glow of national feeling, natural, justified and inevitable under given circumstances, it is declared by the organs of perpetual hate to be "diplomacy," as though a whole people could diplomatize. If, driven back upon our natural lines of defense, we exercise the freeman's natural right to speak his mind out, and yield to the promptings of a manhood not wholly cowed and enslaved, we are "cracking the old slave whip over the shoulders of loyal men."

THE *Cincinnati Enquirer* (Dem. Greenback) commenting on Senator Matthew's speech on his resolution says:

We regard the plan as faulty in several particulars. We will name some: Its two main corner-stones are redemption in coin of the legal-tenders, and suspension of specie payment when the coin fund runs out. No paper circulation ever has been, or ever can be, staple on such a basis.

We want a National, inter-State currency upon which shall neither be written nor printed any such word as *fail*. We want a purely American currency for home use, that will never carry with it the idea of *suspension* under any circumstances, except the destruction of the Government itself. It is the quality of suspension, inherent in the nature of a paper currency that promises to pay coin on demand, that produces so much disaster in commercial crises and currency panics.

The *N. Y. Tribune* (Rep.) deduces the following conclusions from current events.

The events of the past week teach lessons of the gravest importance to the people, irrespective of party, to the President, and to the Republican leaders. There is every reason to believe that the mad partisanship of the Democratic party, its bad faith, its indecent unfairness, and its reckless disregard for public opinion or the public welfare, will keep these lessons fresh in mind until after the elections of this Fall. The same wanton folly which brought upon the country the struggle of last week will continue to threaten its peace and its free institutions until the people put it down by overwhelming majorities.

Manufacturers of Ladies' Suits, that use the Davis Vertical Feed Sewing Machine, are doing the sewing in the most elegant manner, and entirely without basting, or showing the stitches, by the use of very simple attachments. The invention and introduction of the Vertical Feed is an invaluable addition to Sewing Mechanism. The old under-feed machines will be rapidly superseded by this new and more perfect device for sewing, as it is adapted to every variety of work. The Davis Sewing Machine Company are building an addition to their large manufactory at Watertown, New York.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 25, 1878.

BEANS AND PEAS.—The local demand for beans is light but, directed to strictly choice quality especially in mediums. Marrows are in large supply and without much export support. Some further lots are being prepared for South America, but as the feature is new and the stock mixed, the outlet has no immediate effect upon the tone of trade. The late orders for S. A. have absorbed all of the red kidneys that were offering. Fine pea beans scarce. White Kidneys quiet. Canadian peas are easier, 80@82c. for fair to choice in bulk and bond. Green peas steady at the recent advance, $1 05@1 10. The remnant of Southern B. E. Peas very light and held at $3@3 25 per two bushel bag.
We quote medium beans, choice, $1.65@1.67½; fair to good, $1.55@1.60; marrow, prime, free to vessel, $1.70@— fair to good, $1.50@1.60; red beans, $1.40@1.65; white kidney, $1.50@1.70; red do., $2.50@2.60; black beans, $2.40.; Pea beans, $1 40@1 65.

Receipts of beans past week, 3,260 bush. Exports of beans, 277 bbls.

BEESWAX.—Sales of small lots run from 26½@28c.
Exports past week 2,760 lbs.

BROOM CORN.—Has but little inquiry.
Quotations are 6@7½c for hurl and short brush; 5@6½c. for medium green, 4@5c. for red and red-tipped, ₱ lb.

BUTTER.—State half tubs and pails have declined since Tuesday last. Dealers generally thought that the easy rates lately quoted would be sustained, especially with quality so much in buyers favor as it now runs. But the trade has been only steady and receipts have exceeded even a...active spring demand. Added to this Western butter is arriving very liberally and its quality too is remarkably good while the difference in prices for trade lots greatly assists sales. Receipts of State may moderate with the disclosed Weakness; shippers will moderate their collections and dairymen will have to pack. In the latter case we again urge utmost care in putting down this early make, so that the lines may turn out as uniform as possible. Exporters are using some Western butter, but most of them seem inclined to wait until Canada becomes an offset to our market before they purchase heavily Milled Western is entirely neglected. Dairy and ladle packed factory not brisk enough to harden prices. Creameries may be called steady at the prices. Firkins have a fair demand; thus opened at 22c. but have dropped in sympathy with other styles.

Receipts for the week 28,800 pkgs, ; exports 3,996 do.
State creamery, choice 21@22c., a few at 23c.; fair to good 18@20c.; Half tubs and pails selected, 19@—c.; fair to good, 14@17c.; Welsh tubs, choice, 17@18c; other useful, 15@16c.; poor or stale State 10@12c.; Western, creamery choice. 22c.; other, 17@19 c.; Western dairy fine 15@16c.; other, 11@14c.; factory (ladled) 12@13c. do. (milled) 10@11c.; poor Western 6@9c.; do. and grease, 4@6c.

CHEESE.—Receipts have been large, and it has been necessary to yield in prices steadily. The English markets have been drooping, but yet exporters influenced by the comparatively low prices here have bought to a fair extent, the exports for the week reaching 60,111 boxes. The market closed at 9c. for fancy factories.
For factories, fancy, 9c.; 7¾@8¼c. for good and prime; 6½@7¼c. for fair; 4½@6c. for half skimmed, and 3@4c. for skimmed. State, farm dairy at 8@8¾c. for good to choice, 6½@7¾c. for fair to good and 3@4c. for poor skimmed. Western factory fine, flat at 8¼c.; do. good to prime 7@8c.; do. fair, 6@6¼c.; do. half skimmed, 5@6c.; do. skimmed, 3@4½c. Wisconsin factory, fancy, 9c.; do. good and prime, 7½@8¼c.; do fair, 6@7c.
Exports for the week, 62,936 packages.
Receipts, 80,625 boxes.
Gold closes 100¾.
Liverpool quotation, 55s. for new cheese.

COTTON.—There is increased export demand and a strong market. Latest prices are 11.30c@11.32c. for May; for June, 11.32c.; for July, 11.45c.; for August, 11.69c.; for September, 10.80@10.88c.; for October, 10.76@10.77c.; for November, 10.76@10.77c.; for December, 10.85@10.88c.; for January, 10.92@10.95c.; for February, 11.@11.01c.; for March and April, 11.10@11.11c.
Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary, 8 9-16; Strict good ordinary, 9 11-16c; Low middling, 9 11-16c.; Middling, 10 5-16c.

DRIED FRUITS.—There is no trade outside of jobbing lots, and prices are unsettled and easy for other than small lots.
Peaches—Fancy North Carolina 12@13c.; Choice Georgia, 10@11c.; good to prime Georgia; 8@10c.; unpeeled halves, 4½c.; quarters, 4c. Pitted cherries, choice new, 21@22c.; Raspberries, 26@27c. New York State plums, 12½@13; Southern plums, 11@12c. Blackberries, 10@10½c. Apples—State quarters, 4¼@5½c.; do sliced, prime, 6@6½c.; good, 5c.; Western quarters, 4@4½c.; Southern at 6@7c. for prime sliced, 5@5½c. for fair to good; Southern quarters, 4½@4½c.; Tennessee quarters, in bags, at 2½@3½c.; prime and fancy North Carolina sliced at 8@12c.
Exports for the week, 772 bbls. dried apples.

EGGS.—Receipts for the week, 10,704 bbls.; do last week, 12,045 do. Western and Canadian begin to unpack irregular in quality, and losses are generally conceded. Extra fresh near points are firm. Receipts are in sellers' favor, but other produce is abundant and cheap, so dealers are forced to more or less humor buyers.
Near points, 15c.; State and Penn., 13@13½c.; Western and Canadian, fresh, 12½c.; inferior or stored eggs, 11@12c.

FLOUR.—Has been declining on large supplies and the lower range for Wheat. Latest prices are $3.90@4.45 for very poor to choice superfine State; $4.50@4.75 for poor to good extra do. odd lots and lines; $4.75@5.10 for good to fancy do.; $3.90@4.45 for very poor to choice superfine, Indiana, Iowa, Michigan, Ohio, &c., (fancy lots at higher figures); $4.50@4.75 for inferior to good shipping extra do., and $4.75@5.10 for good to fancy extra do. common to choice white wheat extras, $5.00@6.00; choice to very fancy do. at $6.00@7.00; red and amber winter wheat, inferior to very choice trade and family at $4.05@6.00; round hoop Ohio at $4.60@$4.90, and trade and family brands of do. at $5.00@$6.00, the latter rate for choice. (fancy lots quoted higher); St. Louis, $4.65@5.50 for very poor to good extra, and $5.50@6.50 for good to very choice, with a few brands of fancy quality quoted up to $7.00@7.25 Minnesota clear, very inferior to very fancy choice at $4.00@6.00.; Minnesota "straight," inferior to very fancy, at $5.50@6.50, and patent poor to fancy choice at $5.60@8.25; unsound stock at from $2.25@5.75; city mill extra at $5 50@5.80 for fair to very choice for West Indies; do. for England at $4.50@4.75; do. trade and family extras, $6.00@7.50; do. for South America, $6.00@6.75 for fair to very choice; No. 2 at $2.65@3.75 for very inferior to very choice.
CORN MEAL.—Sales are $2.90@3.00 for Brandywine, and $2.25@2.65 for yellow Western.

FRESH FRUITS.—A few lots of selected apples have sold at $8@9: ordinary stock is higher, ranging at $4.50@7.50. A crate of Georgia peaches has appeared. North Carolina brags of her crop. Fine cherries have been steadily arriving from that State; now quoted 15@16c.; Norfolk, 5@10c. Gooseberries, ₱ bu., $1 50@1 75; trade very slow and likely to be until Eastern buyers begin to use them. Strawberries have had a most depressing phase of trade; dealers report low prices and frequently a "stick" at that. New Jersey arrive in good order; quoted 7@11c. ₱ quart; Md., Del. and Norfolk, good, 6@8c.; inferior, 3@5c. Hot-house peaches, doz., $4@5; do. Black Hamburg grapes, ₱., $1 50@1 75. Peanuts are held in hope of old prices. Va. hand-picked, $1 35@1 40; good to prime, $1 15@1 25; common, 90c@$1. Pecans, 6@8c.

GRAIN.—Wheat has suffered a sharp decline, on large supplies and easy English advices.
Latest sales of No. 1 red at $1.25; ungraded white western at $1.28½; extra white at $1.31½; white State at $1.32; No. 2 red in lots at $1.27@1.28; No. 1 Milwaukee spring, strictly pure, at $1.21; No. 2 Milwaukee spring at $1.19; No. 2 Chicago spring at $1.17; New York No. 2 spring at $1.16; No. 3 Northwest spring at $1.13; No. 2 red, May, at $1.22½; do., June, at $1.22; do., July, at $1.19½; No. 2, Northwest spring, May, at option, at $1.18; do., June option, at $1.16½; New York No. 2 spring, May option, at $1.1.6; do., June option, at $1.14½@1.15. Rye at 71@73c. for Western, and 72@74c. for State. Corn has been active and higher; latest sales are of New York No. 2 at 50@51c.; New York No. 3 at 48@48½c. New York steamer mixed at 49½@50c.; low mixed at 50½c.; ungraded mixed at 48@51½c.; steamer yellow at 52c.; white western at 50c.; Kansas mixed at 51@51½c.; No. 2, May option, 50@50½c.; No. 2, June, 49½c.; No. 2, July, 50@50½c.; steamer mixed, May option, 49½@50c.; do., June, 48c.; do., July, 48c. Oats have declined and closed easy. Sales of No. 2 Chicago at 31½@31½c; mixed State at 31@32½c.; white State at 33@38c.; mixed western at 30½@32c.; white western at 32½@38c.; New York No. 1 at 31½@32c.; New York No. 1 white at 33c.; New York No. 2 at 30½@31c.; New York No. 2 white at 31@34½c.

HAY AND STRAW.—Supplies are liberal, and there are free sellers at easy prices. Bale hay, 55@60c. for shipping, and 70@80c. for retail qualities; clover, at 50@60c. for prime. Straw, quoted at 40@50c. for long rye; 35@40c. for short rye, and 40@45c. for oat.
Exports, past week, 950 bales; Since Jan. 1st 27,275 do.; same time last year, 21,430 do.

HOPS.—Exports for the week, 675 bales. The inquiry from brewers is small. Supplies of desirable lots are; very light, and really choice lstock brings ready prices. New Yorks, good to prime, 7@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do, 5@8c.; Yearlings, 2@3c.; Olds, all growths 1@2c.

OIL-CAKE—Western quoted at $30$30,50

POULTRY AND GAME.—Live has declined, heavy supplies of fowls giving killers an independent position. Turkeys hardly wanted at any price. Spring chickens abundant and lower.
Spring chickens now quoted, ₱ lb, 20@25c. Fowls, choice, 11@12c.; Western and Southern 10c.; Roosters, 5@6c.; Turkeys, 8@11c.; Ducks, choice, $1.12; poor to fair, 80@87c., the lowest for Southern; N. J. Geese, $1.25@1.50; other, 70c.@$1.
Country-dressed have merely a nominal place, but near points are in buyers' favor.
Turkeys, 13@14c.; Fowls, extra, 13@14c.; good to prime, 10@13c.; very common, 8@9c. Phila spring chicks, 28@30c; do Western, 20@25c.
Game is scarce, but as there is hardly any local demand there is enough to supply special hotel wants. Dunlich snipe quotable next week. English are out. Sand, 50c. Stall-fed wild pigeons, 90c@$1; flight, 75@80c; wild squab, 60@70c.

PROVISIONS—Have been weak and lower through large supplies of hogs.
Mess pork quoted $8 75@9 for spot lots; $8 60 for June; $8 75 for July; $8 85 for August. Bacon at 4¾c for long clear. Lard at 6.75 for spot, 6.72½ for June; 6.77½ for July, and 6.87½ for August. Beef hams at $19.50. Tallow at 7c. for prime. Stearine at 7¼c. for Western. Beef—For extra mess, $12.@12.25; plain mess, $10@11.50; packet, $13.50@14.50 for bbls.; family mess, $15@16; extra India mess, $20@23 for city brands; do. Philadelphia, $19@20.

TOBACCO.—A fairly active trade is in progress, and prices hold steady and are essentially as quoted latterly:

Ohio assorted lots	7½	@10
Wisconsin assorted lots	7½	@ 9

VEGETABLES.—The supply of old potatoes is diminishing; new are arriving freely and fine. Old Peach Blows, choice, $1 75@2; R. Rose, $1.75@2, with some Eastern growth, $2 25; other, $1 25@1 50, with bbl.; Bermuda, $4 50@5; Charleston and Savannah, $2 50@3.50; culls, $1 25@1 50; New Jersey green peas now quotable at $2@3 ₱ bbl; Maryland, $2 00@2 50; Norfolk, $1 00@2 50. Asparagus is easier: Oyster Bay, $1 25@1 50 ₱ doz; other, 75c@$1 12. Southern cucumbers, crate, $1 50@2 00, in good order. String beans same. Rhubarb, 100 bunches, $1 50@1 75. Spinach, bbl., 37@50c. Kale, 20@30c. Lettuce, $1 25@1 50. Southern cabbages, $1 25@1 50; do. beets, 100 bunches, $2 00@2 50; do. turnips, $1@2; N. J. do., $3@4. Bermuda tomatoes, 40@60c., 5 quart box; do. onions, $1 75@1 80. Florida tomatoes, $3@4 crate.

WOOL.—The new clips from San Francisco and Texas are arriving in increasing quantities, and to sell them easy prices are made. By accepting low figures for general stock a fair amount of trade results. It is not likely that the market will show settled activity until the new Western clips come forward.
Ohio, Pennsylvania and Virginia XXX and picklock, 43@46; XX, 38@41c; X, 38@40; No. 1, 39@41; No. 2, 34@37c.; common 32@34; combing, 40@45.
New York, Michigan, Indiana and Wisconsin. XX, 33 to 36c.; X, 33@36c.; No. 1, 30@39c.; No. 2, 31@35c; common 30@32c.; combing 40@41.
Iowa, Vermont and Illinois X and XX, 33@35c.; No. 1, 34@37.; No. 2, 30@32.; combing, 38@42.
Missouri, Kentucky, and Tennessee—Washed fleece, 30@35c.; unwashed, 25@26c.; unwashed combing, 28@31c.

LIVE STOCK MARKETS.

NEW YORK, May 25, 1878.

BEEVES.—Receipts for the week, 11,454 head; do., last week, 11,820 do. Continued heavy arrivals have rather depressed the market, and prices are easier with some stock left over. Ordinary to prime steers to dress 5@57c.; lbs. sold at a range of 8¼@10½c. Extras brought 10¾c. Exporters paid 10@10¾c. Texas bulls, 3@3½c. live weight.

COWS AND CALVES.—There were not enough transactions to base city quotations upon.

VEAL CALVES.—The market has ruled weak even when supplies were favorably light. N. J. 5½@6.; State, 4½@5c.; Buttermilk calves, 3@3½c.

SHEEP AND LAMBS.—Receipts for the week, 24,986 head; do last week, 27,460 do. Trade has dragged to some extent; the asking rates exceeding the views of buyers in many instances. Clipped sheep sold at 4¾@5c.; New Jersey Lambs, 8½@9c.; Md. 8¾c.; Kentucky, 5@5¾c.; Virginia, 7¾c.

SWINE.—Receipts for the week, 35,115 head; do. last week 28,937 do. No late business; nominal price, $3.40@3.50 per 100; Chicago price, $3@3.10 do.

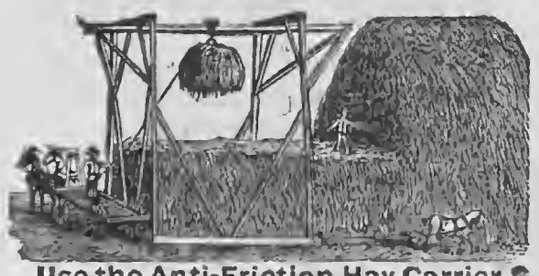
Sure Death to the Potato Beetle.

The Union Mills Bug Destroyer

Contains Paris Green and other poisonous ingredients, mixed ready for instant use, and is guaranteed to effect a speedy and sure deliverance from the ravages of the Potato Beetle.
Directions for using and a good hand sieve for applying the poison with each barrel.
Price $5 per bbl., delivered on cars. Satisfaction guaranteed or money refunded. Address
JOHN RALSTON, 170 Front St., New York.



Use the Anti-Friction Hay Carrier.
For elevating and conveying Hay, Grain, etc., in barn, barrack, shed or field. It elevates perpendicularly and conveys horizontally any desired distance. No trouble about getting over high beams and to the end of long mows or to the top of high stacks. Thousands are now in use. Five tons have been stacked and the frame moved in forty-five consecutive minutes. Fifty tons Hass been stacked in a single day with this Frame and Carrier. SEND STAMP FOR CIRCULAR "3" to U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

KILL

The POTATO BUGS

AND SAVE THE POTATOES.

SURE DEATH to the Colorado Potato Bug is only to be had by the use of Paris Green. Prof. Cook and others say that all other remedies have failed. ENDORSED BY A. S. FULLER, AGRICULTURAL EDITOR OF THE "SUN."

PURE PARIS GREEN

Made by F. W. Devoe & Co., can be relied on for the extermination of the Potato Bug and Cotton Worm. Circular on the use of Paris Green distributed free on application.

F. W. DEVOE & CO'S

MIXED PAINTS.

For the convenience and economy of consumers of PAINT the well-known house of F. W. DEVOE & CO. now prepare

PAINTS READY FOR USE

FOR FARMERS and MANUFACTURERS.

They are uniform in shade, and the colors can always be matched. Any one can paint with them. No need of a painter to mix it for you. No need of a dryer or other ingredients. The paint is ready for immediate application. Send for sample cards showing different shades. They have very superior covering properties and do not, like the so called patent paints, contain either water, benzine or alkali. These Paints are in Liquid Form, and are sold in Gallon Cans and Barrels. They are also put up in small cans of one to five pounds.

F. W. DEVOE & CO.,

Manufacturers and Importers of Colors, White Leads, Zinc White, Varnishes and Artists' Materials, CORNER FULTON AND WILLIAM STS. (OLD DUTCH CHURCH CORNER), NEW YORK CITY.

LADIES IF YOU WISH TO COLOR— Use Leamon's Dyes.

Warranted the best and cest Dyes for all family fancy dyeing. Dresses, Cl Coats, Ribbons, Ties, Feat anything, can be colored shade. Anyone can use t The expense is trifling, especially recommend Black as much better than wood. Sold by druggist any color sent by Mail, size, 25c., small size 15c. for Dye Book and beau Samples, Free.

BEST and CHEAPEST.

Buchan's Cresylic Sheep Dip prevents and cures the scab and all parasitic diseases of the skin.
Buchan's Cresylic Ointment is CERTAIN DEATH to the Screw-worm or Grub.
For further particulars, send for Price Lists and Circulars to
KIDDER & LAIRD, 83 John St., New York.

TO PREVENT THE HAIR from Falling Out, to encourage its growth, and to give it an attractive appearance, use Dr. Jayne's Hair Tonic. A useful toilet article, and a safe remedy for diseases of the scalp.

Reading for the Young.

"POCKET-MONEY FOR THE YOUNG PEOPLE."—No. 4.

PROFESSOR WILLIAM R. BROOKS.

THE possession a of little pocket-money, "all our own, to do just as we are a mind to with," is doubtless one of the great luxuries of life. If this is a luxury prized by the adult, how much more so by the young? I believe, too, that if the possession of money is a pleasure, the earning of it by one's own skill or industry is still more so. And then we are also better enabled to appreciate its value.

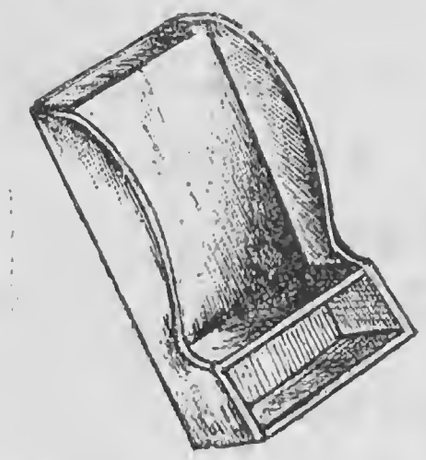
Now, it seems to me there is many a farmer's boy, who by a little industry has it in his power to command no inconsiderable amount of pocket-money; and that with his ordinary quickness and intelligence he will avail himself of this privilege when the way is pointed out.

I shall leave it to others for the present at least, to show, how by farming a small piece of land on his father's farm, the raising of garden stuff or poultry, a farmer's boy might get to himself a little ready cash.

I propose to show how the rural youth, possessing a little dexterity with mechanic's tools—and of such to my knowledge there are many—might manufacture little useful household articles which he can sell to his neighbors—the farmers' wives, and the village matrons; work which can be done on rainy days, and in spare hours. And this mechanical skill thus developed and perfected, will prove of the greatest service in after life in repairing the tools and implements about the farm.

The tools which will be required are not many or costly; almost every farmer has them, and certainly all should have. An important matter is to keep what you have in good order; it will add much to the pleasure of your work. A good, firm work-bench, with a strong screw vise is also quite a help.

One of the handiest little household articles, simple and easy to construct, is what I shall entitle the "Rural Scouring-board." It is for scouring knives and forks upon, and contains also a receptacle for holding the brick-dust, or other polishing powder. Here is a picture of it.



The bottom is made of a piece of three-quarter, or inch board seven inches wide, and twelve inches long. The sides and ends are of one-half inch stuff, and are three inches high—the sides being curved in the manner shown, to give it a little more fanciful appearance. Two inches and a-half from the end-piece is a cross-piece which is fastened by a few brads driven through the side-pieces, and this forms a box to hold the scouring material. The front is left open so that the knife may be laid flat upon the board while being scoured. All the parts should be neatly planed, and the sides and ends fastened together with brads. The boards may be painted any suitable color, but in my opinion a simple coat of varnish would be better.

The "Rural Scouring-board" will readily retail for twenty-five cents, affording, as my young readers may calculate for themselves, a good profit upon the cost of the material. I should like to hear through the RURAL of the first boy who has manufactured one and made a sale. If there are any questions you would like to ask about it, I will answer with pleasure. Let some of our young folks try their hand at this little article, and in a short time I will describe something different. Do not be discouraged at your first attempts, but persevere, remembering always that "practice makes perfect."

A PLEA FOR THE SCHOOL-CHILDREN.

MAY MAPLE.

FOR several years of my life I have been engaged in mind cultivation, that is "teaching the young idea how to shoot;" not an original remark, but one that marks out my work. I find some who are putting forth their efforts in the right direction in educating the younger generation. Their offsprings will be prepared to enter business life, even though they are left without $100 capital. These parents have no need of any suggestions from my pen. But there are many parents who seem to be laboring under a great mistake.

Some of these imagine their children are such wonderful helps that they cannot be spared from the farm even at the early ages of seven, ten and twelve years. I know from experience that children are often absent from class because they are required to stay at home to drop corn and potatoes in seeding time, and I remember one instance when a child of eight or nine years was kept at home two weeks to plant over a piece of ground that any wide-awake man could have planted in half a day or less.

Two youngsters of the same age and ability start for school the first Monday in May. They read passably well in the First Reader. One attends every day, rain or shine, during the term of four or five months, and is supplied with books according to his capabilities; the other comes one day and stays away two or three, and then possibly comes three or four more, coming and going like an intermittent fever. His excuses are often amusing when we take into consideration the age and size of the little man. He has "had to help plant," or "log off a piece for 'taters," or "help ma wash," or he "had to take care of the baby while ma went to the store," or "to see a neighbor," or "to pick berries for sass." His schooling averages about two days of the week. At the close of the term there is an examination. The first-mentioned lad reads well in the Third Reader; he has learned to add, subtract, multiply and divide numbers understandingly; his knowledge of Geography and History is good; he can write a readable page in his copy book, and can spell hundreds of words correctly. The foundation stone is laid for an intellegent, useful man.

How is it with his companion? His advancement is scarcely perceptible. Who is to blame? Not the boy, and certainly not the teacher (although thoughtless parents frequently criticise the ability of the instructor because their children do not learn). Has the little farmer earned enough to pay for his lack of school culture? Most emphatically I declare that he has not.

If parents would send their children to good schools from the time they were seven till they were fifteen years of age, for ten months of the year, and then claim their services till they were twenty-one, it would be money in the parent's purse and far less injustice to the offspring.

At fifteen the boy or girl is strong enough to be of use, while at the same time they will be capable of learning by practice and observation what they have before learned only in theory. And many a lad or lass would lay up a fund of useful knowledge during the evenings and odd days when otherwise unemployed, that would be a perpetual fountain of usefulness during all their lives.

Whereas the child who has an occasional day, or week, or month at school, even from the time he is five years old until he is twenty-one, will have a very limited amount of knowledge with which to begin a business life. And undoubtedly he will be obliged to knock about the world doing the drudgery for his former companions; looked upon as a sort of ignoramus incapable of using his best energies.

Look about us and behold the Jacks-at-all-trades who are good for nothing! They have large capabilities, and yet, for lack of knowledge rightly directed, their talents are rusting, their lives are miserable failures, and our nation and the world at large poorer in abilities and slower in its march of progress.

Some parents have a habit of sending their students to school without tools to work with, depending almost entirely upon the teacher or neighbors to supply the deficiency of books, slates, pens, paper and pencils. Others get their supplies from "Noah's ark," or from their great-grandmother's library. If they move from Maine to California they still expect to use the same series of books if they patronize the district school. Now, the fact is such students may just as well remain at home. Their time and energies are not only wasted, but they are a trial to any wide-awake teacher, and a detriment to any school.

Trying to educate the present generation from text-books that are out of date, and should long ago have been cast into oblivion, is not wise. Neither is it wise to use books that have been lately published, if they differ from the general series used in the district. Remember that the more classes the less time can a teacher have to devote to each one, and when only two or three minutes—as is often the case—can be spared for a recitation, but very little can be demonstrated.

Again, there is another set of injudicious parents who make a great mistake. These are anxious to have their children well educated, and they are pretty sure to send them to school regularly, and to supply them with all needful apparatus; and yet they fail in the true art of progression. They are anxious to accumulate a plenty of this world's goods for future years, when the threads of silver shall have found a place among their locks. Also, each dear child will need a few broad acres or golden eagles when he leaves the old home. And all this is laudable, provided it is not carried to such extremes as to deprive justice of its due in other matters.

But when children are called from their bed at four o'clock in the morning, and are kept busy at work "choring" here and there till it is almost or quite time for the school-bell to ring, and then bidden to make haste to school or they will be late, and to "hurry home as soon as school is over, as there are lots of chores to be done"; *this*, I say, *is injustice*.

The pupil comes into school thoroughly exhausted. How then can he undergo mental exercise with proper energy? He takes up a book and tries to read over his lesson; the letters all run into one continual jumble; he rubs his eyes and tries to brighten up his ideas but tired nature rebels; he soon loses consciousness and all idea of labor, either mental or physical is forgotten, while sweet sleep locks his thoughts in oblivion. Very soon he may be awakened by the ever vigilant but not otherwise clever teacher. But alas! for him, study now as hard as he may, he comes to his class with little if any knowledge of his lesson. Of course he receives a reprimand, and in not a few instances he is dubbed a "stupid, brainless blockhead."

Is the child to blame when he fails to pass a creditable examination, although he has not "missed a day" in the whole school year? Is the teacher to blame for not being able to instruct the intellect that is benumbed by physical labor? To cultivate the brain requires diligent forethought on the part of parents as well as instructors. There must be much self-denial and sacrifice to attain that degree of culture necessary to use one's ability to the best advantage. There are many talents buried in napkins for want of knowledge. There may not be many individuals who possess ten talents by which they might make successful competitors in all business transactions, but those who possess five possibilities of success in one or more branches, comparatively speaking, are quite numerous, yet for lack of knowledge, our parlors are often filled with simpering ignorant ladies, (!) more ornamental than useful; our country flooded with tramps, our almshouses filled with paupers; our prison cells lined with criminals, and our country taxed millions of dollars to supply the deficiency of wasted ability.

We glory in our country's government; for in most respects we believe it to be the best in the world, but its education laws might be greatly improved. For instance, we would have a certain series of graded books for every district school in the State, thus doing away with such a heterogeneous mass as now exists; and a certificate of qualification should be required for every occupation. Each individual should be able to bring all his gifts to the altar of usefulness; educate thoroughly in those branches for which the pupil has a natural inclination. There is no child with its five senses, but has at least one talent given him whereby he may be of use to himself, and a benefit to the world at large, if he has the proper culture.

THE MAN EVERYBODY LIKES.

HE is often very short, very lean and very homely, but this makes no difference; he is the man that everybody likes and looks up to. An Adonis might enter the town, but he could not usurp his place; no indeed, for he is too firmly rooted in the hearts of the people.

In the first place he is not a bigoted man. He believes in everybody having their rights:—yes, even in women receiving equal pay when they do the same amount of labor as a man. He also believes in giving the minister enough salary to live on, and doesn't sneer at all other denominations excepting "mine."

In the second place he doesn't know it *all*. He has enough humanity to conceive that there are things in this world beyond his knowledge. He is willing to be taught, but never tries to teach others.

In the third place he possesses a great heart, with "charity for all, and malice towards none." When you enter his presence it is just like the effect of a warm fire on a cold night. He always stands up for the weakest side,—is very forgiving; very apt to overlook your shortcomings and think you will do better next time. If any of the boys get into trouble they go to him. He has a faculty of smoothing it all out and starting them in the right path again. Older men go to him also. His clear, concise manner of stating a case is sure to brush the fog away when they are perplexed.

His wife (if he has one) is considered the luckiest woman in town. She does seem to enjoy herself, and is in most cases fat and rosy, with a hearty, infectious way that is suggestive of pleasant things at home.

When in society, his manner is perfect. He is very attentive, and listens to your hobby with the utmost patience. He knows just who is the most lonely and needs a little attention. If there is a girl or ancient maidon who is overlooked, Mr. N. will be sure to find her corner and have a pleasant chat, which brightens her up for the whole evening. In fact, he has a way—not by flattery, for he does not descend to that, but by the reflex of his own sunny disposition—of making everybody feel pleased with themselves.

Somehow, he gets to be *the man* of all the men in the town. If anything important comes up, it is, "consult Mr. N."; if any one falls into trouble, it is, "run for Mr. N."; and it is "Mr. N." all the time, because you see *everybody* likes and trusts him.

M. E. STONE.

RUSSIAN MERCHANTS.

THE two great blemishes on the character of the Russian merchants as a class are, according to general opinion, their ignorance and their dishonesty. As to the former of these there cannot possibly be any difference of opinion. The great majority of the merchants do not possess even the rudiments of education. Many of them can neither read nor write, and are forced to keep their accounts in their memory, or by means of ingenious hieroglyphics, intelligible only to the inventor. Others can decipher the calendar and the lives of the saints, can sign their names with tolerable facility, and can make the simpler arithmetical calculations with the help of a little calculating instrument called *stchety*, which resembles the *abaca* of the old Romans, and is universally used in Russia. It is only the minority who understand the mysteries of regular book-keeping, and of these very few can make any pretensions to being educated men. Already, however, symptoms of a change for the better in this respect are noticeable. Some of the rich merchants are now giving to their children the best education which can be procured, and already a few young merchants may be found who can speak one or two foreign languages and may fairly be called educated men.

ECONOMY.—Perhaps there is no word in the English language that has been so foolishly narrowed in its meaning as the word economy. Most people think of it as a saving of money, as though to be economical, was in a certain sense, to be stingy or mean. Now, economy in its true interpretation is the art of management—is the wise adaption by which we arrange time, health, and strength so as to produce the best results.

Sabbath Reading.

THE WISE MAN'S CHOICE.

MAN'S days are as grass: as the flower of the field so shall he flourish.—PS. Ch. II. 15.

SEE, in her thorny stalk reclining,
Yon withered rose, so sickly pining!
Yet late her crimson cheek was seen
In dewy lustre brightly shining.
Thus quickly fades our youthful bloom,
When age or sickness steals upon us;
And when we sink into the tomb,
Not long our nearest friends bemoan us,
Till beauty then the sage despises.
Him never her tempting lure entices;
Naught but fair virtue's doubtless charms,
That deck the soul, he fondly prizes.
Unmoved he smiles at fortune's frown,
Scorning all her fleeting favors;
His hope that rests on God alone,
And always Him to please endeavors,
Beneath His sacred wing protected,
Still towards Him it is directed,
He journeys on through life secure,
Till comes the happy term expected,
When ended all his care and toil,
He flies to meet his God's embraces;
Who welcomes him with gracious smile,
And 'mong his saints in glory places,

A STEP BACK OUT OF ERROR.

THE following bit of experience, says The Congregationalist, is recounted in a letter to his sister from the pen of an estimable Christian, who has conscientiously "sounded all the depths and shoals" of that plausible and fascinating error of which he speaks, and will be read with interest, and we trust with profit:

I have looked much into the "Higher Life" theory, so called; have attended "holiness" meetings, have been looked upon as a "higher-life man," have spoken again and again in meeting of the the fullness of the blessing," "entire sanctification," the "rest of faith," etc., and have, of course, been brought in contact with the brethern who profess it; and now, what is the result? I have entirely given up attendance on holiness meetings; I have seen so much to offend and disgust me, that I have been gradually led to the conclusion that my place was to work quietly in my own church, and not make a hobby of any particular doctrine. I have discarded all that literature, because I have found a want of harmony, also a conscious spirit, an "I am holier-than-thou" tone in some, and a mysticism in others; but I feel instead an increasing delight in the Word of God.

I have doubtless, my dear sister, encouraged you in this theory by my letters and influence; and now I write plainly to tell you, before God, that I am beginning to see my mistake and am anxious to influence all I can to come back to the simplicity of the Word of God. The Lord has, no doubt, richly blest you; let love take the place of theory, let your light shine in your own church; if it is cold, and the pastor, to your mind, formal, all the more need of your warm, Christian influence. Mind you, I don't say there is no such thing as a "blessing." I believe I have it. I believe you have it; the precious indwelling of the Holy Spirit, the abiding of Jesus in the soul, the hidden life, the cleansing; but I believe that *every* child of God has the same blessed spirit in him, though he may be weak and not know his wealth. The *tendency* of this theory is to lead to the formation of a set or party or clique, who perhaps not intentionally, are setting themselves up as more spiritual, as having made higher attainments than the mass of Christians. As they walk into church the feeling *will* come; "I am free; I am fully sanctified." I have had that feeling, and say it with shame and confusion, but confess it. Now all my higher life is concluded in this—assurance of God's love, peace of conscience, joy in the Holy Ghost increase of grace. Conscious of a poor, weak, sinful heart, but all the more clinging to my dear Saviour for the cleansing and forgiveness for which I am sure I receive.

I want for myself and for my dear sisters, a strong, healthy, rounded Christian life; full of Jesus and His word; free from theories and "isms." I hope and expect to be daily growing in grace, and not to be fully sanctified till I die, though righteous in God's sight now because of faith in His dear Son. While I reckon myself "dead to sin," I must watch the old man till I die.

THE more any man improves his graces, the clearer, the sweeter, fuller and richer is his enjoyment of God here. There is no man in all the world who has such enjoyment of God as that man has who most improves His graces. It is not he who knows most, nor he who hears most, nor yet he who talks most, but he who exercises grace most, that has most communion with God, that has the clearest visions of God, and that has the sweetest discoveries and manifestations of his Lord and Master.

MANY saints have had their hearts warmed and heated by sitting near other saints' fires, by eyeing and dwelling upon other saints' graces. When men's graces shine as Moses' face did—when their lives, as one speaks of Joseph's life, is a very heaven, sparkling with variety of virtues as with so many bright stars—ah! how are others stirred up to glorify God, and to cry out, "These are Christians indeed; these are an honor to their God, a crown to their Christ, and a credit to their gospel."

THE number of difficulties makes the Christian's conquest the more illustrious. A gracious man should be made up all of fire, overcoming and consuming all opposition, as fire does the stubble. All difficulties should be but whetstones to his fortitude.

PERSONAL ITEMS.

Dion Lewis is suffering from congestion of the brain and paralysis, at Oakland, Cal.

Colonel Robert Ingersoll denies that he is a Communist. He is making too much money as a lecturer to believe in dividing it.

If the National party should ever gain the ascendancy in this country, Benjamin F. Butler would be President of the United States.

"I mean business," said a burglar who entered Mr. Patterson's house, in Sterling, Ill. "So do I," said Mr. Patterson, and shot him through the head.

J. Milton Turner, our colored Minister to Liberia, wants to come home because he believes he has been in office long enough to deserve a good office somewhere else.

The late W. S. O'Brien, one of the California Bonanza Kings, a year before his death, settled $1,000,000 on a woman who now claims to have been his wife, and entitled therefore to a third of the $20,000,000 he left behind him.

Victoria C. Woodhull has met with considerable success in London, where she is living quietly and modestly, and will not return to America. The hard knocks she has sustained have driven a great many "isms" out of her head.

The Duke of Aosta, ex-King of Spain, will spend a month viewing the Paris Exhibition. There are at present in Paris alone, three ex-Queens of Spain: Isabella, Christina and the wife of Don Carlos. The ex-Kings and Queens seem to be on the best of terms, as the papers daily announce visits of one to the other.

Last summer, Master Jesse Grant was present, as he often was, at a great party in a great London house, and found it dull. Complaining to a friend that the entertainment did not meet his views, he was reminded that it was open to him to go away. "Yes," responded the young heir to the White House, "I know that, but you see I don't want to break up the party so early."

The Duke de Biron, when condemned to death during the French Reign of Terror in 1793, ordered, on returning to prison, oysters and chablis. The executioner entered as his Grace was enjoying the repast. "Just let me finish my oysters," said the Duke, "and meanwhile take a glass of wine with me, my friend; you'll need a a fillip for your work;" and then he filled a bumper for the turnkey and himself, and presently went off to be guillotined.

The most venerable couple in Texas, perhaps in the country, are Mr. and Mrs. Robinson of Mountain City. He is reputed to be 103 and she 102 years old, and they were married in Kentucky eighty-two years ago. Mr. Robinson says he never swore but one oath, has never borrowed but fifty cents, and never gave a note. He and his wife are like children in their devotion to each other, and after any separation shed tears on meeting. Recently they were presented with a comfortable house by a generous neighbor.

Wit and Humor.

SPARKS AND SPLINTERS.

THE cucumber graceth the festal board
Enshrouded in condiments rare,
And the epicure gleefully rubbeth his paunch
At the sight of the treasure there.
The doctor smileth a sad-like smile
And giveth a crocodile groan,
And the marble man goeth out the while
And polisheth up a stone.
The undertaker mournfully asks
"What will his measure be?"
And the sexton marketh a spot "reserved"
All under the willow tree.
'Tis hard the times and 'tis scarce the cash—
And so with a zestful joy
We welcome waft to the fitful fruit
That giveth the folk employ.

[*St Louis Journal*

AN Irishman being asked why he wore his stockings the wrong side outwards, replied it was because there was a hole on the other side.

WILSON, the celebrated vocalist, was upset one day in his carriage near Edinburgh. A Scotch paper, after recording the accident said: We are happy to state he was able to appear the following evening in three pieces.

"You are fond of tea," remarked a boarding-house mistress to a boarder who had passed over his cup to be filled the third time, "very fond of tea!" He replied, "I should think I was, or I wouldn't be willing to drink so much water to get so little of it!"

"Mamma," asked a resident youngster, "is our old hen going to be sent away for the summer!" "I guess not, my son," she replied; "but why do you ask such a question?" "Because I heard pa tell our hired girl that they would have such a sweet time when he sent his old hen away for the summer."

THE fashion reporter who wrote with reference to a belle: "Her feet were encased in shoes that might be taken for fairy boots" tied his wardrobe up in a handkerchief and left for parts unknown when it appeared the next morning: "Her feet were encased in shoes that might be taken for ferry-boats."

A COUPLE were married in Georgia by a justice of the peace. Unto the man he said, "Sir, will you have the beloved woman you hold by the right hand, in the name of the State of Georgia, Cobb county, and the new constitution, whether it be adopted or not, to be your lawful, wedded wife?" And to the woman he said: "Madam, will you take this man to be your lawful husband, under the Constitution of the United States and the constitutution of the State of Georgia, no matter who is President?"

AT a happy spot where a number of negroes reside, an old negro was heard calling out to his wife: "Manda! Is you got dem chickens shut up in de smoke-house, like I told yer?" "No; an' I like ter know what's de matter wid you, that yon's so mighty tickler 'bout dem chickens all at once?" she replied. "Neber you mind. I know what's de matter, and dat's nuff till dem chickens is housed. When I hears dat dem niggars over dar in de next yard gwine to hab a party tomorrow night, I wants to be shore dat my chickens does't 'tend it; you hear me?" The chickens were at once locked up.

A Manifest Absurdity.

It is manifestly absurd to claim for a mere stimulant, tonic and alterative properties. Yet this is what is daily done by the vendors of cheap local bitters, colored to make them look attractive, and agreeably flavored, but the alcoholic basis of which is of the vilest and most hurtful description. The transcendent success of Hostetter's Stomach Bitters, the leading alterative tonic of the United States, has induced many of these compounders of drams in disguise, to attempt the counterfeiting of this standard medicine, but their efforts have never proved successful on a large scale, and they have themselves in many instances notoriously "come to grief," through the instrumentality of the law.

The genuine Bitters have, indeed, a spirituous basis, but they are emphatically a medicine, since their botanic ingredients are signally efficacious in overcoming and preventing chills and fever, dyspepsia, liver complaint, constipation and many other disorders.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S

ELECTRIC BELTS

AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

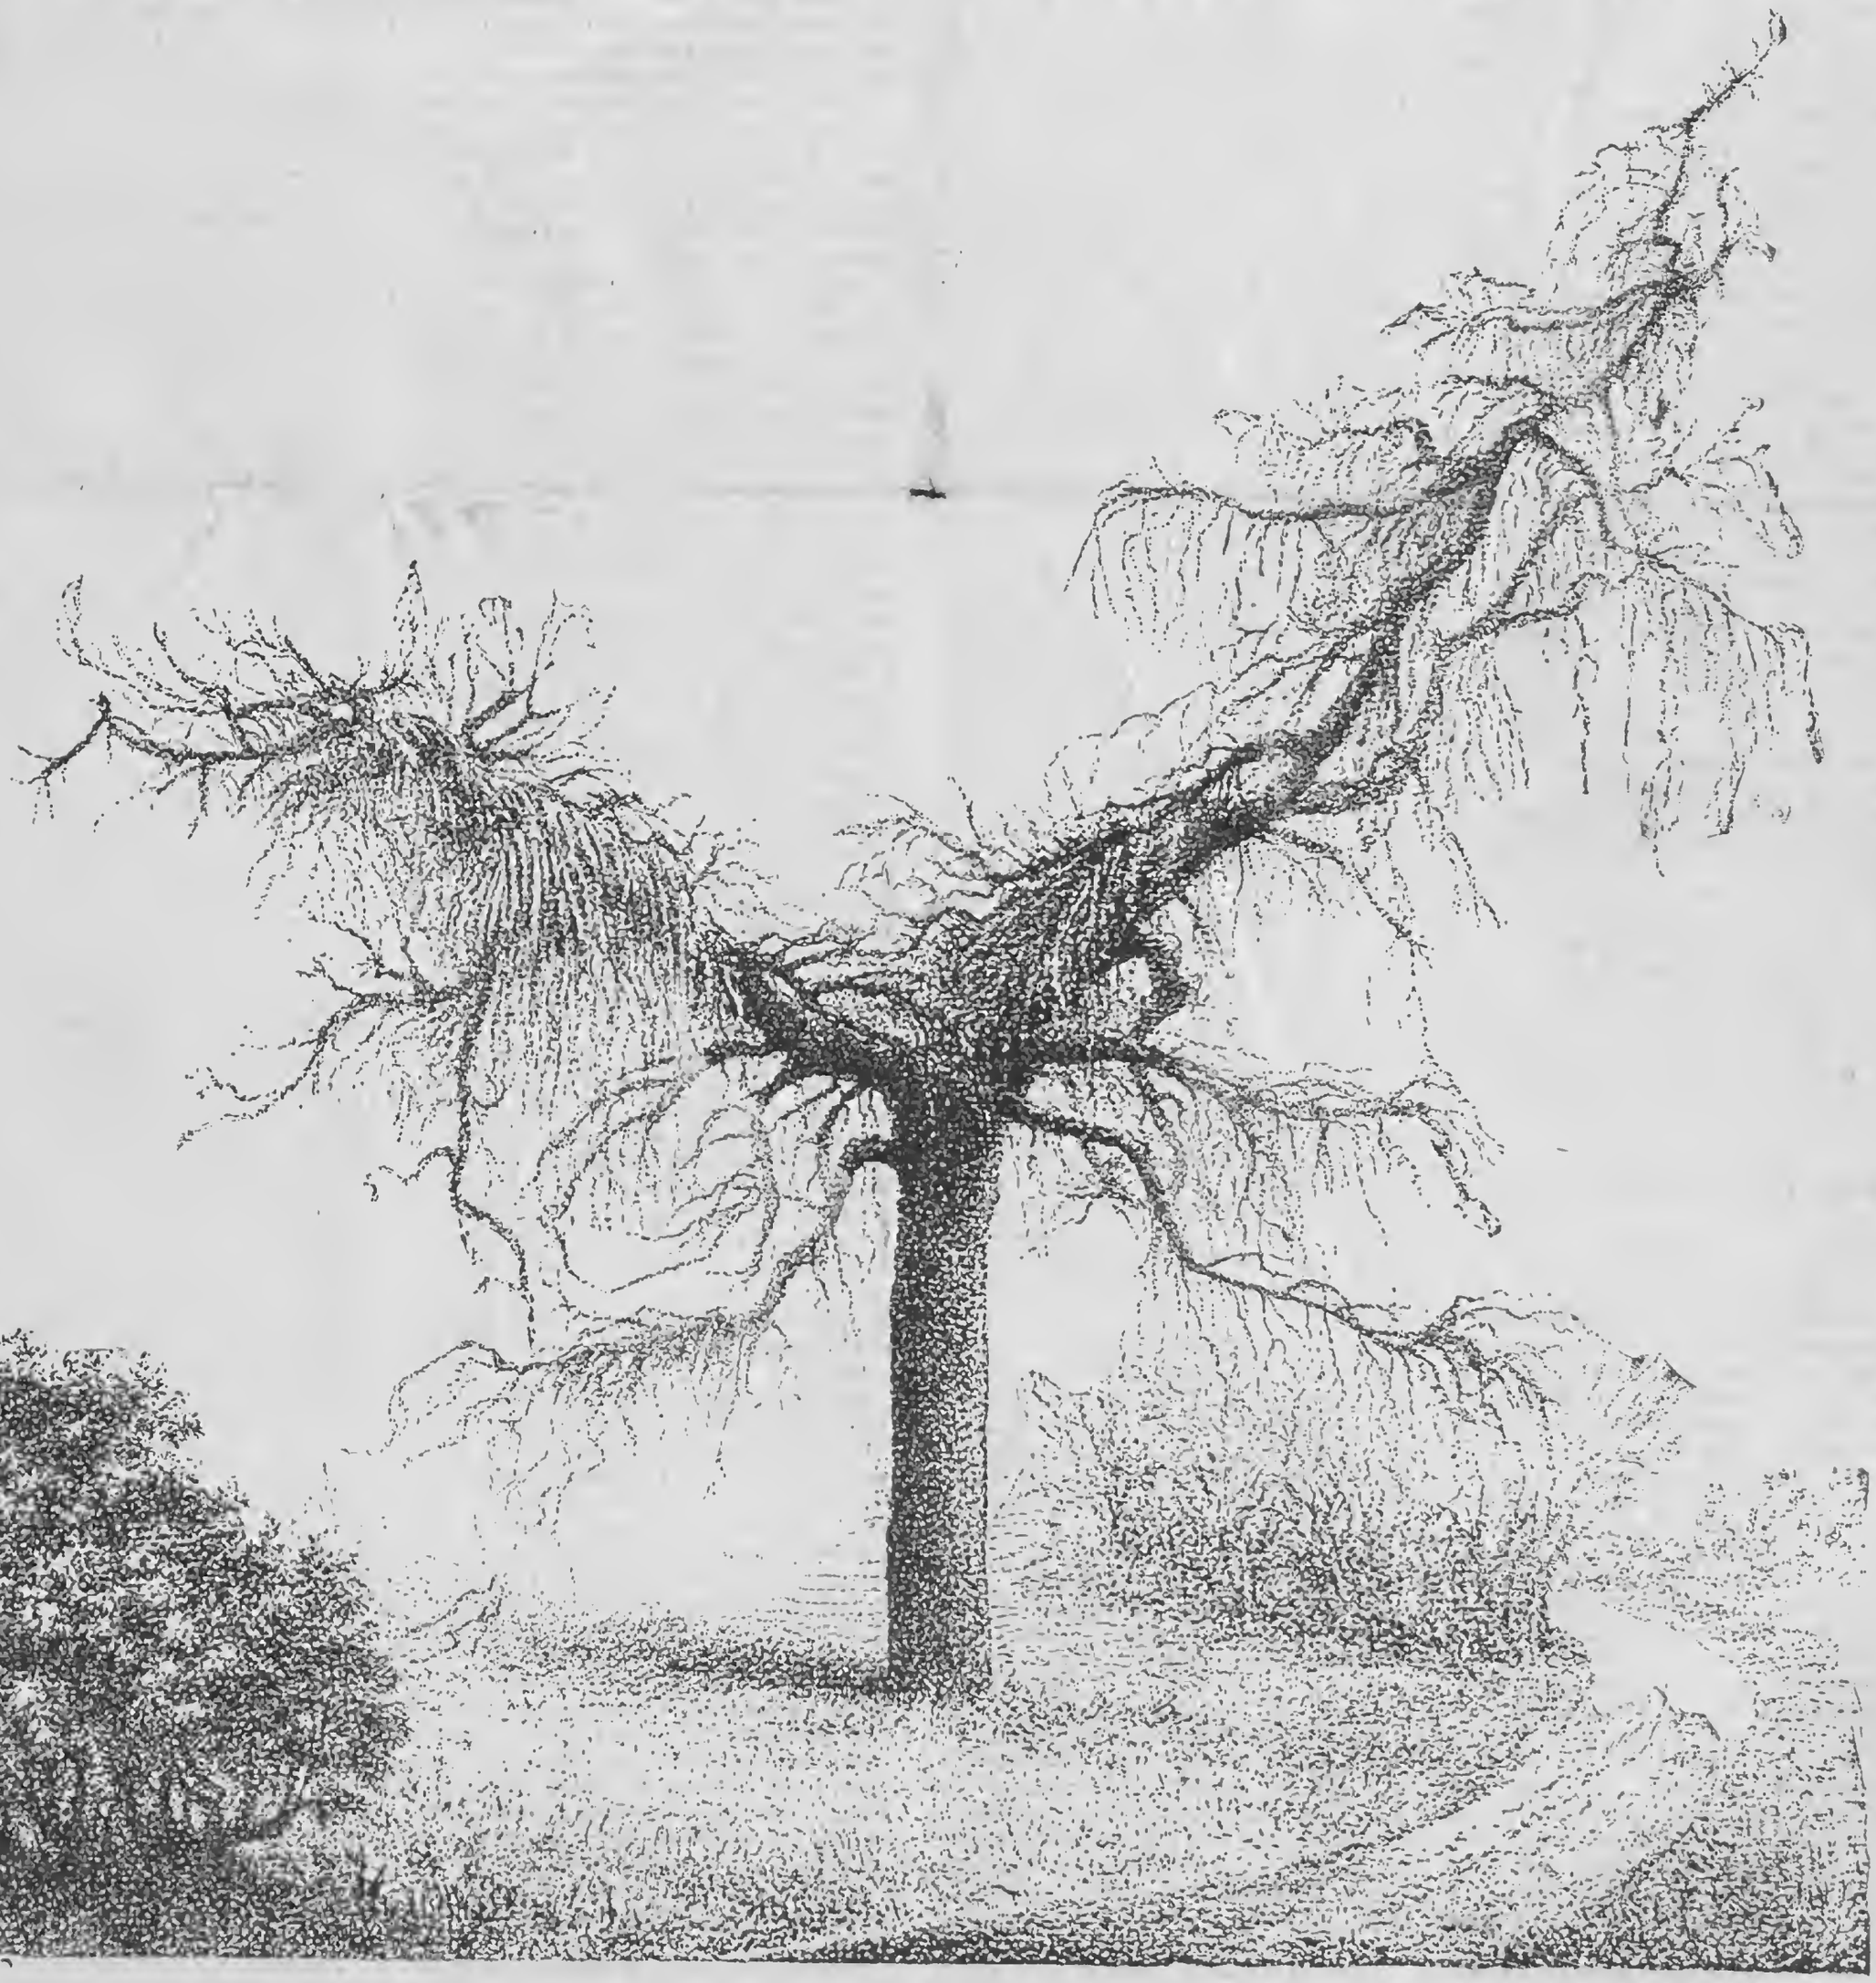
OUR TREE PORTRAITS.

LARCHES.

THE Larch, unlike most other coniferous trees, is not an evergreen. There are but few species, and these are all natives of mountainous regions in the northern parts of the Old and New worlds. The American Larch, known also by the names, Black Larch, Hackmatack and Tamarack, grows in primitive forests sometimes to the hight of from 80 to 100 feet, though generally it is considerably smaller. In the more northerly latitudes it is found in uplands, but within the limits of the United States it is almost invariably to be met with in moist or swampy soils. In cultivation it grows well on nearly any soil, but thrives best on deep moist ground. The wood is close-grained, heavy and remarkably strong. It is very durable in contact with the earth, and valuable for ship-building, rafters, and all kinds of timbers used in building.

The European Larch differs from the American species mainly in its pendulous branches and the shape and color of its cones, which are about half as large. Throughout Central Europe it is largely cultivated, both as an ornamental and timber tree; and it has the well-earned reputation of combining rapidity of growth, symmetry of form, durability of wood, and adaptability to a variety of uses in a greater degree than any other timber tree of northern latitudes. Of late years it has been pretty extensively introduced into the United Stated; and in many places is giving satisfactory returns.

There are many trees whose peculiarities of growth are better shown in winter than during that period when the branches are clothed in foliage. The specimen of Larch presented below is certainly one. It stands in the private grounds of Mr. S. B. PARSONS of Flushing, L. I., and was drawn by our artist during January last.—[To be continued.



WEEPING LARCH.—FROM LIFE.

Farm Topics.

WHAT SALARY DOES A FARMER RECEIVE?

PROFESSOR W. J. BEAL.

He receives the equivalent of a larger salary than ninety-nine out of a hundred of them are willing to admit. They underestimate their own profits, and overestimate the profits of men living on a salary.

There is a great difference among those who live by farming. A great many work the soil because they do not know what else to do, or because they cannot live by any thing else. Many of this class hardly deserve to be classed as farmers. They lower the standing of farming as a business. I believe there is no business by which a man can live so well with so much neglect, as in agriculture. Still nothing better repays good care and ability. It is rather slow to yield brilliant returns at the outset: so is any business. The farmer's profits are concealed in the rise of land—in improvements by ditching, clearing, new buildings, more land, more tools, or better stock. Most farmers have no idea how much it costs them to live. They forget to figure in the pork, poultry, mutton, butter, flour, vegetables, etc., etc. The salary-man lives entirely by his individual efforts. In estimating a salary, we must do so by looking at the privileges enjoyed, the hard work of brain and muscles, and the gain in property or improvements.

I am personally acquainted with two brothers in Michigan, who started out on an equality about twenty years ago. One of them, after a good education, went to farming, the other to teaching. They had only a few hundred dollars apiece to start with. The one who followed teaching for the last six years, has received annually from two thousand to two thousand seven hundred dollars. One-third of this amount would be called a large salary by nine-tenths of our farmers, who can save as much each year as does the teacher referred to. The farmer, of the two brothers under consideration, owns and works a small place of seventy or eighty acres, which he is steadily improving. He has good buildings. He owns a small cheese factory. He is out of debt. He has lately bought fifty acres more of land worth $2,000, and from previous experience, he is certain he can save five hundred dollars a year above all expenses, to apply as payment on his recent purchase. He is easily keeping up with the teacher in accumulating wealth. He works no harder. The natural tact of the two men for work and business was not much different, while they worked together on the old homestead. The farmer in question is not an old fogy in any sense of the word. He is all the time looking for new and better implements, but he is very cautious about buying any of them until he has seen them tried and knows that he can make good use of them. He does not make costly experiments, but he is every year trying some new vegetables or grains or grasses. He is improving his stock by some purchases, and by "natural selection." He wastes no money in rushing from one department of farming to another. He keeps cows, raises some hogs, a little wheat, some corn, hay and grass, some fruit and poultry. In no sense of the word can he be said to have made money by buying low and selling high. He is not a trader. He has no tact in making his money by good bargains. What he has earned has come by legitimate farming. Some would call him a little conservative. He is very cautious, saving, industrious, but he dresses well and lives well.

Agricultural College, Lansing, Mich.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

DEATH TO THE TENT-CATERPILLAR.

In looking over the orchard the other day, I found a great many webs of the Tent-caterpillar; more than at any one time during any preceding year. Further investigation proved that the plum, cherry and peach trees were in the same manner infested. This must be attended to immediately. A ball of cloth saturated in kerosene, and affixed to a long pole, makes an excellent torch for burning them up. I tried this two years ago, and never saw another caterpillar on the trees during the remainder of the season. The proper time for burning them is early morning, before they leave the webs for a foray upon the leaves of the tree. If care is exercised, the flame need come in contact with none of the branches, and the tree remains uninjured.

CLOVER HAY.

The clover field is heading out, and will be fit to cut soon. Clover makes excellent hay, if cut at the right time and properly cured; and although it does not contain quite as much nutriment as timothy, horses and cattle eat it more readily, and its value as a fertilizer makes it most profitable to grow. The crop must be cut when in full bloom, and put up in cocks as soon as wilted. After standing one day they must be handled over, reversed, the top placed at the bottom, and *vice versa*. This, repeated every day for three days, will give us, next winter, fresh, fragrant hay, which the cattle, sheep and calves will relish almost as much as grass. And I shall not hesitate to feed it to the horses and cattle, for it will not be dusty, as much clover hay is.

DUSTY HAY.

Speaking of dusty hay, calls to mind some I cut two years ago that had become too ripe. The hired man, although a good one, failed to remember that old Kit had rather weak lungs, and fed some of the dusty hay. The consequence was that in two days she coughed badly and showed strong indications of heaves. The hay was immediately removed, and clean, bright oat straw substituted, and the feed of grain well wet. In a few days the cough and stricture of the lungs entirely disappeared, and have not since returned.

FLOWERS IN THE DOOR-YARD.

As I write, facing the window, I can but pause to admire a Wiegela growing before it, its pink-and-white, bell-shaped blossoms forming a delightful contrast to the dark green of the lawn. It was only planted a year ago, yet I now count one hundred and eleven bunches of flowers, with from five to eight flowers in a cluster. I never saw a finer, more showy shrub for the lawn, and it has the good quality of being perfectly hardy, requiring no extra care or cultivation. By a judicious selection, shrubs of excellent qualities might be found growing in farmers' yards much more frequently than they now are. A well regulated, carefully tended yard or garden goes a great way toward "setting off" the farm.

APPLES FOR HOME USE.

Notwithstanding the severe frost, fruit promises to be abundant. Apple trees were never set more full of fruit, Northern Spys especially. These are the best of winter fruit for our cold climate. They start so much later than others in spring that they are not so apt to be injured by frost, and although rarely bearing while very young, when once started they invariably give a good crop annually of fine, marketable fruit. A tree at Maplewood Farm gave seven barrels the tenth year. Moreover, who ever saw an ill-shaped tree of this variety? Next to the Spy, I would plant the Wagener for home consumption. But, unlike the Northern Spy, trees of the Wagener variety, when young, will produce so much fruit that, if it is suffered to remain on the tree, the vitality of the latter will be destroyed.

MANAGEMENT OF DUCKLINGS.

A neighbor had a fine flock of young ducks, some thirty in number. For some cause unknown to him, they died off rapidly until but twelve remained. In distress he asked my opinion of the cause of his loss. My first question was in regard to their food, and when I learned that meal—corn meal—had been fed, I assured him that he could attribute his loss to that. Young ducks should have curd; not a particle of meal until six or eight weeks old. Mr. Berry has since substituted curd, and the ducklings are all healthy and growing finely. Chickens, too, are very fond of sour milk. I always keep a supply where they can have free access to it at all times.

CORN AND THE CROWS.

The corn is planted, and now the question arises: How shall we save it from the depredations of the crows? Last year I put white twine about the field, but the sly thieves viewed this with the utmost contempt, pulling the corn directly under it. This season, should their visits become too frequent, I shall follow the plan advocated by an experienced farmer—that of soaking eight or ten quarts of corn and scattering it about the field on the surface. That amount will keep the rascals employed until the corn has grown so that it is no more a temptation to them. I dislike to kill birds of any species, for I consider them always the farmer's firm allies.

ELECAMPANE FOR HORSES.

A piece of Elecampane root, cut up fine and mixed with the feed of horses every day in spring, is an excellent tonic and blood purifier. They may show some hesitation in eating it at first, but will soon learn to like and eat it readily; while the sleek, glossy appearance of their coats will give ocular proof of its beneficial effects. It is easily procurable in the pastures or road-sides of the Eastern and Middle States, and even as far west as Illinois. Its persistent use has been known to cure cases of the heaves, when not too firmly seated.

DOCKING LAMBS.

The sheep were neglected this spring, and turned to grass before tagging. This is an oversight that must not occur again. The long wool and longer tails become ready receptacles for the accumulation of filth. Notwithstanding the protestations of some of Bergh's disciples and my own dislike to inflicting unnecessary suffering on dumb animals, I believe it to be proper and right, both for the comfort of the animals and the feelings of their owners, that lambs be docked. Little or no pain attends the operation, if done quickly and at the right time, and the animals will be much more cleanly. Too much care cannot be exercised in handling sheep during washing and shearing. Mr. Packer, formerly one of our most successful sheep raisers, was very particular in his selection of men to do this work. The cruel practice of lifting them about by the wool, and taking off large pieces of skin with the shears, is too barbarous for any humane man's sanction, and any man in my employ guilty of such cruelty, might look for a speedy discharge.

PRECAUTIONS AGAINST THE CURCULIO.

Anticipating a visit from the curculio, the plum trees were subjected to a liberal sprinkling of soot and ashes each morning, while covered with dew, from the time the buds became white until fruit became well set, and as a consequence they give promise of an enormous crop.

Miscellaneous

THE TRUTH ABOUT IT.

[Under this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—Eds.]

THE POETRY OF THE FARM.

S. Q. LENT.

I do not mean that kind of a jingle which is put together by people who go from towns into the country, and after a short sojourn of a few days, enjoying the pure air and specially prepared palatal delicacies, go into rhapsodies over country life; who frame their nice compliments for the farmer in words like these: "How delicious is country life!" "The farmers must be the happiest people on the earth!" "I should be in elysium had I the ownership of a farm like this!" All this is stuff, and is easily conjured up for the occasion.

But there is real poetry connected with farm life that is endorsed with both rhyme and rhythm, and the production of it is not due to any chance sojourner who partakes of the bounties without the toil. This poetry is made by the farmer and his own household. There is less of it written than there might be, for there is a world of latent ability and the lines are not written upon chance slips of paper in stolen moments, but impressed upon human hearts, to be read there in all the years of a lifetime. Beautiful trees, ornamental flower borders, tasteful surroundings, all those beautiful things that give charm to a country home, are the inspiration to the poetry of the farm; and if I could impress upon my brethren of the country the fact that they have a great deal of talent lying dormant for making this poetry, I should be doing a better work than in writing columns of the best kind of dissertation upon the culture of roots, wheat, corn or oats.

"It is all very well for newspaper talk, and sounds very nicely on paper," says my farmer friend, "but when you come to scratch for a large family, and get wherewith to feed their hungry mouths and cover their bodies with passable clothing, there is little time to write your kind of poetry by fussing with flower beds, cutting off the door-yard grass every week, and all that sort of thing."

But I do not hesitate one moment in making a reply to this, that there is enough time, labor, and ingenuity wasted upon the farm to render it a model of grace and beauty. There is a principle implanted in our natures that craves food as instily as our stomachs, and as many people die from the want of it as from the need of food to build up the bodies. I refer to that love of beauty and beautiful things, which, if gratified, stimulates to right action, commendable exertion and loving thoughtfulness, without which we might as well be so many sticks and stones.

Men can live upon potatoes and salt, with but very little in addition, for a time; they can be satisfied, under necessity, to move about in uncomely fabrics; but contentment under such circumstances is out of the question for any length of time. As means are gathered, it is considered no matter of extravagance to have the best of food in variety, and to be clothed tastefully in fine apparel. Time and thought of the most earnest type are given to these. Much less, then, ought it to be counted idle expenditure to attempt to satisfy a higher desire of the human heart, to embellish a home with tasty surroundings that will hold its occupants under the most tender subjection to the true, the beautiful and the good. There is a molding power in each flower and shrub, which exhibits its effects in the government of the family, and in the mellowed nature which results from the position in which is placed in the heart the memories of these attributes of the childhood's home.

Who can cite a happy home, overflowing with general good nature and family affection, without the accompaniment of beautiful things in its outward adornment. The two go hand-in-hand. The outer circle is an index to the inner one. "We guess the pulp before we cut the peel." There is a warmth of soul engendered by the effort put forth on the embellishment of a home, which affects the conduct of each member of the family. In its power it is akin to religion.

There is one thought in connection with this adornment of the exterior home that to me is a grand one. We are not working for ourselves alone. The crops of grain, the vegetables and fruits of the orchard, which we develop, may be entirely to our own benefit; but the beauties we add to our premises are the property of the neighborhood, and even the stranger without the gates has an interest there safely invested. They not only bring comfort and happiness to others, but material possessions. Every dollar or day's work expended on trees, flowers, lawn or hedges, is invested for the benefit of the the whole country about. More than this, the value is not lost when we leave the treasures, but with all the added increments of the years, they are handed down a possession to futurity.

Whittier appropriately put the thought into rhyme:

"For he who blesses most is blessed,
And God and man shall own his worth,
Who toils to leave as his bequest,
An added beauty to the earth."

HAVING EYES, THEY SEE NOT.

M. OAKEY.

Under the above heading Mr. Chas. W. Garfield, on page 311; criticises the manner in which children are at present educated by our common schools. While there is truth in what he writes, yet, in the main, he is unjust to teachers, and does not get at the bottom of the matter. He holds that children should be taught to observe more the things around them by the study of natural history and objects, and pay less attention to the mere routine of Grammar, Arithmetic and Geography. Failing in this, their powers of observation are not developed as they ought to be.

Now for not pursuing such a course the teachers are not to be censured, because they are not competent to do so. Nor are they to be blamed for incompetency. The salaries paid to the common school teachers will not purchase so much value. Those who possess such abilities, find better fields and higher remuneration for their intellects. Mr. Garfield himself cites a notable incident of incompetence, which I am sure is not the only one. I remember, ten years ago, a class that went from school, but partially matured, and ill prepared for any brain work, most of whom applied for certificates to teach, and secured them from the County Commissioner. This was in New York State. I afterwards asked the Commissioner how it was he gave certificates to such, and he replied: "They are as good as the average," and certainly I have met since with many who were poorer, though that class did not comprehend, and could not master, a single branch they taught, not excepting reading. How could they develop the faculty of observation in others? They are not to be blamed for securing the places, but the system is faulty.

Ask the farmers and it will be found they prefer to have their boys taught the elementary branches and leave them to learn practically about "trees and crops and bugs." To touch the sciences in their course they regard as time thrown away in which they "better do something else." Nor is it any better with private schools. Pupils must be hurried off to college or rapidly prepared for business to begin the ladder while young. No time is allowed for any branches other than those which directly prepare for the end in view. The introduction of any such system as Mr. Garfield hints at, would be regarded as an innovation, and meet with opposition. I speak from experience. The school patrons should be censured.
